</tr>
</tbody>
</table>

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-E-127-PL-A and 200-E-127-PL-B). The majority of the pipeline is constructed of large diameter corrugated metal pipe. The 36 inch diameter corrugated metal pipe enlarges to 42 inch diameter corrugated metal pipe at Manhole #8 (north of B Pond). The pipeline is marked with steel posts and Underground Radioactive Material - Pipeline signs. Near the 810 gate, an area of growing contaminated vegetation was stabilized with biobarrier and posted with Underground Radioactive Material Area signs. A portion of the pipeline is under the Liquid Effluent Retention Facility (LERF) berm.

Process Description: The pipeline conveyed PUREX and B Plant effluent to the (216-A-25) Gable Pond or the (216-B-3) B Pond system. The effluent stream was directed to the preferred pond via Diverter Station #3. The pipeline south of Diverter Station #3 is constructed of 91 centimeter (36 inch) diameter corrugated metal. From Diverter Station # 3 northward to the 216-A-25 Pond, the pipeline is constructed of 107 centimeter (42 inch) diameter corrugated metal pipe. The portion of the pipeline between the 241-A-201 cooling water storage tanks and the 216-A-42 basin (30 inch VCP) was taken out of service in June 1992.

Waste Type: Process Effluent

Waste Description: The pipeline conveyed process cooling water from 202-A Building (Plutonium Uranium Extraction [PUREX] Plant). From May 1958 to 1960, the unit received the above plus cooling water from the contact condenser in the 241-A-431 Building. In 1960, the unit received the above plus the surface condensator cooling water in the 241-A-401 Building (A Tank Farm). From November 1967 to January 1968, the unit received the above plus the wastewater from the 284-E Powerhouse. From January 1968 to March 1969, the unit received the above plus the cooling water and steam condensate from the 244-AR Vault. In March 1969, the pipeline to the contact condenser cooling system from the 241-A-431 Building Vault was valved out. After March 1977, the unit received the above plus the 242-A Evaporator steam condensate cooling water. RH0-CD-798 shows a valve at the east end of the 216-B-2-3 Ditch connecting to PUREX Cooling Water Line to Gable Pond. The graphic is labeled "Effluent Pipelines and Transfer Capabilities for Gable Mountain and B Ponds".
main part of the facility is the 202-A Building, in which the fuels were reprocessed. It is a reinforced concrete structure, 1,005 feet by 119 feet by 100 feet high (306 meters by 36 meters by 30 meters), with about 40 feet (12 meters) of the height below grade. The building consists of three main structural components: (1) a thick-walled concrete 'canyon' in which the equipment for radioactive processing is contained in cells below grade; (2) a pipe, sample, and storage gallery section; and (3) a steel and transite annex that houses offices, process control rooms, laboratories, and the building services. The portion of the canyon below grade is subdivided into a row of 12 process equipment cells paralleled by a ventilation air tunnel and pipe tunnel through which intercell solution transfers are made. The air tunnel exhausts the ventilation air from the cells to the main ventilation filters and stack.

Location: The PUREX Plant is located in the southeast corner of the 200 East Area.

Related Sites/Structures: This site is associated with the individual components of this TSD that have their own WIDS numbers as of September 2001 are: 202-A-E-F11 (PUREX Tank E-F11), 202-A-E5 (PUREX Tank E5), 202-A-F15 (PUREX Tank F-15), 202-A-F16 (PUREX Tank F-16), 202-A-F18 (PUREX Tank F18), 202-A-G7 (PUREX Tank G7), 202-A-U3 (PUREX Tank U3), 202-A-U4 (PUREX Tank U4), and 202-A-WS-1 (PUREX Waste Piles). Site 216-A-29 (Snow's Canyon, PUREX Chemical Sewer) is TSD D-2-3. Sites 218-E-14 and 218-E-15 (PUREX Tunnels No. 1 and No. 2) are also a separate TSD S-2-1. Some of the major liquid effluent disposal facilities associated with PUREX are Gable Mountain Pond (216-A-25), B-Pond (216-B-3), and the 216-A-42 Trench, which received emergency radioactive discharges that were diverted from going to the ponds. Process condensate form the final uranium cycle was monitored for radioactivity and discharged through a stainless steel pipe to the 216-A-10 Crib south of the west end of PUREX. Steam condensate was also monitored for radioactivity and discharged to the 216-A-30 Crib east of PUREX. Ammonia scrubber waste condensate was sent to the 216-A-36B Crib south of PUREX. Steam and process condensates and acid overflow from the 203-A Area tanks were sent to the 216-A-3 Crib, north of the 203-A Tank Farm. Several radiologically controlled areas are adjacent to PUREX, including 200-E-103 on the south side and 200-E-107 on the east side. Site 200-E-44 is the PUREX Railroad Cut.

Process Description: PUREX was designed and constructed to provide supplemental fuel reprocessing capabilities to separate plutonium and uranium products from irradiated fuel. The PUREX process was designed to reprocess aluminum-clad uranium metal fuel to recover weapons-grade plutonium and depleted uranium. The process was later modified to reprocess zirconium alloy clad fuel from N Reactor to recover fuels-grade plutonium, slightly enriched uranium, and neptunium.

Waste Type: Water
Waste Description: Some of the waste remaining in the facilities include lead (in paint, light bulb contacts, shielding, pipe joints, washers affixing transite), mercury (thermostats and switches), asbestos (transite siding, insulation, gaskets), organic substances (greases and residues in gearboxes and bearings), PCBs (transformers, ballasts, lubricants, oils), cadmium (dissolver moderator lining in canyon cells), and silver (silver reactor in cells), chromium (in cell debris).

</tbody>
</table>

Hanford Site Waste Management Units Report
February 2015
Related Sites/Structures: The stack is associated with the 216-B-13 French Drain and the Sand Filter (sitecode 200-E-30).

Process Description: The stack provided air exhaust for the 221-B Canyon building. Sand Filters were added to the B Plant exhaust systems in 1948. The sand filter was constructed for use in conjunction with the bismuth phosphate process. Later, HEPA pre-filters (291-BC and BD, BF and BH) were installed in parallel with the sand filter.

Waste Type: Equipment
Waste Description: The air exhaust system was contaminated with radioactive particulates.

| Start Date: 1/1/1998 |

Description: The 296-B-1 exhaust stack is a 29 meter (95 foot) carbon steel pipe anchored to the south side of the 221-B building.

Location: The 296-B-1 Stack is located adjacent to the south side of 221-B, Section 8.

Related Sites/Structures: The stack is associated with 221-B, 221-BK and the ACT prefilter and HEPA filter banks. It replaced the 291-B Exhaust Stack (200-E-137).

Process Description: The new canyon exhaust system consists of two parallel Air Cleanup Trains (ACT) prefilters and two banks of High Efficiency Particulate Air (HEPA) filters.

Waste Type: Process Effluent
Waste Description: Filtered canyon air is exhausted through the stack.

| Code: 200-E-140 | Classification: Not Accepted |
| Names: 200-E-140; Gravel Pit 32 | Reclassification: None |
| Type: Depression/Pit (nonspecific) | Start Date: |
| Status: Inactive | End Date: |

Description: The site had been an open excavation containing gravel. A site visit in October 2004 noted that the construction of the new Immobilized Low-Activity Waste (ILAW) site had extended over the gravel pit area. No evidence of the gravel pit remains.

Location: The site is located south of the PUREX facility. It is north of 1st Street and west of Canton Ave. It is on the west side of the gravel road that leads to PUREX.

Related Sites/Structures: 200-E-106 (Immobilized Low-Activity Waste storage)

Process Description: The site was used as a source of clean backfill material. It is a good source of sand and sandy soil.
### Waste Type: Soil

**Waste Description:** The site is a source of backfill material. No waste is stored at this site.

*Hanford Site Waste Management Units Report*

February 2015

1830
Location: The pipeline extends northward from the 242-B Evaporator building to the 216-B-11 A cribs.

Related Sites/Structures: The pipeline is associated with the 242-B evaporator and the 216-B-11 A&B cribs.

Process Description: The pipeline transported evaporator condensate waste to the cribs.

---

Location: The pipeline is located northwest of the 241-BY Tank Farm.

Related Sites/Structures: The pipeline is associated with the 216-B-61 crib.

---

Location: The group of transfer lines extend northward from the 241-AW Tank Farm and connects to the west side of the 242-A Evaporator building. The lines cross under 4th Street.

Process Description: Lines SN-219 and SN-220 drop out of the encasement near the southwest corner of the 242-A Evaporator building and continue into the 241-A Tank Farm. They connect to the 241-A-A and 241-A-B Valve Pits. SN-219 and SN-220 are inactive lines. In October 2009, SL-167 and SN-269 are considered to be active lines. SL-168 and SN-270 are back up lines that could be used if SL-167 or SN-269 failed.

---

Location: The pipeline is located northwest of the 241-BY Tank Farm.

Process Description: Lines SN-219 and SN-220 drop out of the encasement near the southwest corner of the 242-A Evaporator building and continue into the 241-A Tank Farm. They connect to the 241-A-A and 241-A-B Valve Pits. SN-219 and SN-220 are inactive lines. In October 2009, SL-167 and SN-269 are considered to be active lines. SL-168 and SN-270 are back up lines that could be used if SL-167 or SN-269 failed.

Direct Buried Tank Farm Pipeline

Type: Direct Buried Tank Farm Pipeline
Status: Active
Start Date: 
End Date: 

Description: The waste site is three underground transfer lines buried in the same soil trench. Lines DR334 and DR335 are 25 centimeter (10 inch) diameter carbon steel lines double contained within 30 centimeter (12 inch) diameter carbon steel pipes. Line DR343 is a direct buried 15 centimeter (6 inch) diameter carbon steel pipe.

Location: The group of lines extend north from 241-AW Tank Farm to connect to the north side of the 242-A Evaporator Building. The lines cross under 4th Street.

Related Sites/Structures: The lines are associated with 241-AW and the 242-A Evaporator.

Process Description: In October 2009, these lines were considered to be active.

Code: 200-E-212-PL
Classification: Accepted
Reclassification: None

Type: Direct Buried Tank Farm Pipeline
Status: Active
Start Date: 
End Date: 

Description: The waste site is four underground carbon steel pipelines buried in the same soil trench. Lines SL-509 and SL-510 are 5 centimeter (2 inch) diameter carbon steel pipes double contained inside 10 centimeter (4 inch) diameter carbon steel pipes. Lines SN-609 and SN-610 are 7.6 centimeter (3 inch) diameter carbon steel pipes double contained inside 15 centimeter (6 inch) diameter carbon steel pipes.

Location: The transfer lines extend from the east side of 241-AW Tank Farm to the west side of 241-AP Tank Farm. The cross under Canton Ave., north of 272-AW.

Related Sites/Structures: The pipelines are associated with the 241-AW and 241-AP Tank Farms.

Process Description: In October 2009, these lines were considered to be active pipelines.

Code: 200-E-235-PL
Classification: Accepted
Reclassification: Consolidated (5/31/2011)

Type: Radioactive Process Sewer
Status: Inactive
Start Date: 
End Date: 

Description: The waste site is 7.6 centimeter (3 inch) and 10 centimeter (4 inch) diameter carbon steel pipes that distributed waste from the 207-A pump pit to the three sections of the 207-A North basin.

Location: The 207-A North Retention Basin is located east of Canton Ave. and north of 4th Street. The distribution lines extend north from the 207-A pump pit.
**Related Sites/Structures:**

The distribution lines are associated with the 207-A pump pit and the 207-A North basins.

**This Site Was Consolidated With:**

- **Code:** 207-A-NORTH
- **Names:** 207-A-NORTH; 207-A-NORTH Retention Basin; 207-A; 207-A North; 207-A Retention Basin

**Location:**

The 207-A South Retention Basin is located east of Canton Ave. and north of 4th Street. The distribution lines extend south from the 207-A pump pit.

**Related Sites/Structures:**

This site is associated with the 200 East Powerhouse Ditch (sitecode 200-E PD) and the 216-A-29 Ditch.

**Process Description:**

The original, horse shoe shaped ditch emptied into a shallow depression east of the 200 East Area fence known as the Powerhouse Pond from 1946 through 1953. In 1954, the powerhouse ditch effluent was redirected to B Pond. This is the ditch currently known as the 200 East Powerhouse Ditch (sitecode 200-E PD).
**Code:** 200-E-302  
**Classification:** Accepted (Proposed)

**Names:** 200-E-302; 2715EC Steam Condensate and Overflow Drain; Miscellaneous Stream #224

**Type:** Injection/Reverse Well  
**Start Date:**

**Status:** Inactive  
**End Date:**

**Description:** The drain is a 3 foot diameter, concrete structure.

**Location:** The drain is located southwest of the 2266 E building. It is near the northeast corner of 2715EC at N135661.2/E573627, approximately 1 foot from the corner of the building.

---

**Code:** 200-E-304  
**Classification:** Accepted

**Names:** 200-E-304; 218-E-12B Trench 94, Submarine Trench

**Type:** Burial Ground  
**Start Date:**

**Status:** Active  
**End Date:**

**Description:** The waste site is a large open pit. Many vessel reactor compartments are visible inside the trench.

**Location:** The burial ground is located inside 200 East Area, north of the 241-C Tank Farm and south of 12th Street.

**Release Description:** In 1995, 15 gallons diesel oil spilled to soil in Trench 94. The affected area was approximately 32 by 15 feet, 28 inches deep. The area was remediated and the soil was removed to Hanford Central Landfill. Reported Date: May 2, 1995.

**Related Sites/Structures:** The active trench 94 is associated with the inactive 218-E-12B burial ground.

---

**Code:** 209-E-WS-1  
**Classification:** Accepted

**Names:** 209-E-WS-1; 209-E French Drain

**Type:** French Drain  
**Start Date:**

**Status:** Inactive  
**End Date:**

**Description:** In 2011, amended water was sprayed during the 209E building demolition activities. Post-demolition, three to six inches of surface material was removed from all areas affected by the amended water and prior to applying a gravel cap. The final gravel cap was expanded to cover all affected areas. The posted URMA was expanded to include the entire gravel cap. The gravel cap now covers several WIDS sites. The additional WIDS sites under the 209E gravel cap are 200-E-4, 200-E-35, 209-E-WS-1, 209-E-WS-2, 2718-E-WS-1 and 200-E-293 (2718E footprint). The 209-E-WS-3 (Tank 111), adjacent to the south side of the foundation, is within the URMA but was not covered or backfilled.

The drain had a metal cover that was painted bright yellow, because it was located in a paved parking area. The unit was a french drain that is 1.2 meters (4 feet) in diameter and 2.4 meters (8 feet) deep.
Location: The unit is located in the parking area at the northeast corner of the 209-E Critical Mass Building, office wing.

Related Sites/Structures: The site is associated with the 209-E Building and 200-E-294.

Process Description: This site received steam condensate only. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Process Effluent

Waste Description: The unit received steam trap condensate and steam condensate from 209-E.

---

Code: 216-E-28
Names: 216-E-28; 200 East Area Contingency Pond; 216-E-25
Type: Pond
Status: Inactive
Start Date: 1/1/1986
End Date: 
Description: This 216-E-28 Contingency Pond is inactive and dry. It is a large cobble filled depression that is divided into three lobes by soil berms. Each lobe has a 1.2 meter (48 inch) diameter corrugated metal culvert. It is not marked or posted.

Location: The 216-E-28 Contingency Pond is located east of the 200 East Area perimeter fence and north of the 216-B-3 Main Pond.

Related Sites/Structures: The 216-E-28 Contingency Pond is associated with the 216-B-3 Pond system.

Process Description: When the 216-B-3 Main Pond and 216-B-3-3 Ditch were isolated, a new pipeline was built to divert effluent to the 216-B-3 Pond Expansion Lobes and this Contingency Pond. The 216-E-28 Contingency Pond was designed to receive effluents from the B Pond streams. It was held in reserve for any future embankment failures in the ponds. It was never needed and never used for this process. However, in 2007 drill cuttings and mud, from three boreholes and one corehole drilled at the Waste Treatment Project Vitrification site, was placed into the Contingency Pond.

---

Code: 218-E-3
Names: 218-E-3; Construction Scrap Pit
Type: Burial Ground
Status: Inactive
Start Date: 1/1/1954
End Date: 1/1/1971
Description: The pit was exhumed and material removed. It is now part of an open field with sparse vegetation (rabbitbrush and cheatgrass) growing in the gravel.

Location: The site was located in the extreme southwest corner of 200 East Area, north of Highway 4S. It was north of 1st Street and east of Akron Ave.
**Waste Type:** Misc. Trash and Debris  
**Waste Description:** The site received metal slip forms, barrels and timbers from the construction of 202-A that became contaminated with ruthenium-106 from a REDOX stack release.

</tbody>
</table>

**Description:** The site is no longer marked or posted.

**Location:** Originally the site (burn pit) was located in the southeast corner of the 221-B Exclusion Area approximately 94 meters (300 feet) south of 221-B.

**Related Sites/Structures:** The site was related to the 221-B exclusion area. Materials that were burned were collected from within this area and burned in the pit.

**Process Description:** At one time the site was a burn pit that was used to burn wooden items removed from the 291-B stack area during cleanup of the 221-B Exclusion Area. A trench approximately 1.2 meters (4 feet) deep was dug. The contaminated material was then burned and the remaining ashes were covered with soil. The site was excavated to determine the remaining activity. Pieces of partially burned wood and ashes were uncovered at a depth of 1.2 meters (4 feet). Radioactivity was non-detectable. The zone was released from Radiation Zone status in 1972.

**Waste Type:** Oil  
**Waste Description:** According to the documentation, no waste remains at this site. In 1955, contaminated wooden forms, a shack and other wooden items were placed into a 1.2-meter (4-foot) deep trench and burned. The ashes were backfilled with dirt and the area was marked with "Underground Contamination" signs. In 1971, the site was excavated to a depth of 1.2 meters (4 feet). A radiological survey was done on the ashes and partially burned wood. No radiological contamination was found. The site was released from Radiation Zone status. Stenner et al. (1988) report that the site has been exhumed and the contents removed to a 200 East Area burial ground.

**Description:** The area is a barren field. The area designated for additional waste trenches in the western portion of the 218-E-12B Burial Ground was never used.

**Location:** This site is located south of 12th Street in 200 East Area. It is west of trench 37 in the 218-E-12B burial ground.

**Related Sites/Structures:** The 218-E-12B Annex is associated with WIDS sitecode 200-E-288, which documents a small amount of debris.
Sixty-one of the proposed trenches were designed to be 370 meters (1,212 feet) long, thirty-one
of the trenches were designed to be 293 meters (960 feet) long. The remaining proposed
trenches would vary in length from 94 meters (307 feet) to 580 meters (1,901 feet).

PUREX Tunnel Number 1 is an extension of the railroad tunnel, extending south of the east end
of the 202-A Building. It is an enclosed, above ground storage facility. It is approximately 109
meters (358 feet) long, 5.8 meters (19 feet) wide, and 6.9 meters (22.5 feet) high. The railroad
tracks have a one percent downgrade to the south. The tunnel is ventilated by an absolute
filtered exhauster at the south end of the tunnel.

The site is located south of the east end of the 202-A building.

The tunnel construction was completed in 1956. The tunnel is filled to capacity with failed
equipment on eight rail cars. A water-fillable door has been drained and the tunnel door is
sealed shut.

This site received extremely large, heavy or highly contaminated waste equipment stored on
eight railroad flatcars. The volume of waste on the rail cars ranges from 53 to over 168 cubic
meters (1,900 to over 6,000 cubic feet). The curie content decayed through 1990 was 945.3 of
cesium-137, 845.2 of strontium-90 and 0.0684 of ruthenium-106. Railcars 1&2 contain a HA
column and jumpers with approximately 2400 curies of radioactive material. Railcar 3 contains
a failed E-F11, 1WW waste concentrator with approximately 40,000 curies of radioactive
material. Railcar 4 contains a G-2 centrifuge with approximately 3,000 curies of radioactive
material. Railcar 5 contains a failed E-H4 waste concentrator with approximately 1,000 curies
of radioactive material. Railcar 6 contains a failed E-F6, 2WW waste concentrator with
approximately 700 curies of radioactive material. Railcar 7 contains a second failed E-F11,
1WW waste concentrator with approximately 40,000 curies of radioactive material. Railcar 8
contains a spare failed, waste concentrator with approximately 700 curies of radioactive
material. 230 kilograms of lead is associated with the material on the railcars.

The above grade tunnel is covered with soil. The railroad tracks have a one percent downgrade
to the south end of the tunnel. The tunnel is constructed of a bituminous coated steel liner
attached to external reinforced concrete. The tunnel is ventilated by a filtered exhauster at the
south end of the tunnel. The water has been removed from the "water filled" door and the
tunnel door has been sealed.

PUREX Tunnel Number 2, located southeast of the 202A Building, is an extension of the
railroad tunnel. It is east of 218-E-14 (Tunnel Number 1).
Process Description: The tunnel construction was completed in 1964. The tunnel stores contaminated equipment on flat bed rail cars and three empty liquid waste tank cars. Seventeen shipments were received during 1995 and 1996 from the 324 Laboratory Facility cleanout activity. The tunnel contained a total of 28 rail cars as of July 1996.

Waste Type: Storage Tank

Waste Description: The unit received extremely large, heavy or highly-contaminated waste equipment stored on railroad flat cars. The tunnel has the capacity to hold 40 railcars. As of June 1996, 28 railcars had been placed in the tunnel. The tunnel contains an estimated total of 2,730,000 curies of radionuclides and 762 grams (27 ounces) of plutonium. In addition to radioactive contaminants, the equipment stored in the tunnel also contains lead, silver, mercury, cadmium, chromium, barium and oil.

---

**Process**

**Description:**

The system includes a septic tank, a dosing chamber, and a three-section drain field. The area is covered with gravel and marked appropriately.

**Location:**

The septic system is located inside 200 East Area, north of 4th Street and west of Baltimore Ave.

**Process Description:**

This system is designed to replace several smaller septic systems located in 200 East Area. The septic system is approved for a flow rate of 54,890 liters per day (14,500 gallons per day). The septic tank is an 82,350 liter (21411 gallon) tank, located east of the three drain fields. An area west of the drain fields has been reserved for a fourth drain field, that has been proposed for future use. A 52,500 liter (13,650 gallon) dosing tank is located adjacent to the septic tank.

**Waste Type:** Asbestos (non-friable)

**Waste Description:**

The septic system receives sanitary waste with volumes up to 54,890 liters (14,500 gallons) per day.

---

---

**Code:** 2607-E8

**Classification:** Accepted

**Reclassification:** Closed Out (11/9/2004)

**Names:** 2607-E8; 2607-E8 Septic Tank and Tile Field

**Type:** Septic Tank

**Start Date:** 1/1/1953

**End Date:** 1/1/1997

**Description:** The septic tank was properly abandoned in 1997. The septic tank surface is identified by two circular access ports surrounded with concrete. A sign, on the ground in April 2001, reads "2607-E8". The associated drain field had a capacity of 13,400 liters (3,533 gallons) per day.

**Location:** This unit is located north of 1st Street and east of Baltimore Avenue, across from the 2101-M Building.

**Related Sites/Structures:** The 2607-E8 Septic Tank was associated with the 2607-E8 Tile Field, the 2101-M Building, the MO-021, the MO-042, the MO-043, the MO-407, the MO-413, and the MO-234 Buildings. It was replaced by the 2607-E8A regional system.

---

Hanford Site Waste Management Units Report
February 2015
Process Description: The 2607-E8 Septic Tank and associated drain field were designed to accept and treat sanitary sewer effluent from the connected facilities.

Waste Type: Process Effluent

Waste Description: Septic Tank 2607-E8 receives sanitary wastewater and sewage at an estimated rate of 220 cubic feet (6.24 cubic meters) per day.

Closure Info: The reclassification to Closed Out is documented on form 2004-121. The system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501.

Code: 2607-E8A

Names: 2607-E8A; 2607-E8-A; 2607-E8A Regional Septic System

Type: Septic Tank

Status: Active

Description: The septic system is surrounded with light posts and chain.

Location: The septic system is located south of the 284-E Powerhouse, on the east side of Baltimore Ave.

Related Sites/Structures: The new regional system replaced the 2607-E8 septic tank and tile field.

Process Description: The system was constructed in 1996. It is approved by the State of Washington to receive a flow of 54,890 liters per day (14,500 gallons per day).

Waste Type: Storage Tank

Waste Description: The 2607-E10 Septic Tank system consists of two tanks and receives sanitary wastewater and sewage. The drain field associated with this system has a design capacity of 1,298 gallons (4,900 liters) per day.

Location: This unit lies north of the 216-A-37-1 Crib and east of the 241-AP Tank Farm, in the area known as the Grout Treatment Facility.

Related Sites/Structures: The 2607-E10 Septic Tank is associated with a drain field, the Grout Trailer, MO-392, MO-041, MO-282, MO-283, MO-284, MO-997 and MO-243-G4.

Process Description: The 2607-E10 Septic Tank and associated drain field are designed to accept and treat sanitary sewer effluent from the connected facilities.

Waste Type: Process Effluent

Waste Description: The 2607-E10 Septic Tank receives sanitary wastewater and sewage at an estimated rate of 665 gallons (2,500 liters) per day.
### Code: 2607-E11

**Classification:** Accepted

**Reclassification:** Closed Out (11/9/2004)

**Type:** Septic Tank

**Start Date:** 1/1/1985

**End Date:** 1/1/1997

**Description:** The unit was properly abandoned in 1997. It is a two-chamber tank. The tank has an associated drain field and had a capacity of 3,500 liters (927 gallons) per day.

**Location:** The site is located inside 200 East Area, north of 4th Street and east of Baltimore Ave. The system is located southeast of the Dry Materials Receiving and Handling silos.

**Related Sites/Structures:** The 2607-E11 Septic Tank was installed to support the Dry Materials Receiving and Handling Facility (2400-E) Building, the Transportable Grout Facilities, and the MO-385, MO-386, MO-354 trailers.

**Process Description:** The 2607-E11 Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2400-E Building, the Transportable Grout Facilities, MO-385, MO-386, MO-354 and the Dry Materials Receiving and Handling Facility. This project was abandoned and its associated buildings are no longer occupied.

**Waste Type:** Storage Tank

**Waste Description:** This system received sanitary wastewater and sewage at an estimated rate of 835 gallons (3160 liters) per day. There are no sampling results or inventory information available for this site.

**Closure Info:** The Closed Out reclassification is documented on form 2004-104. The system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501. It was replaced by a new regional system.

### Code: 2607-E14

**Classification:** Accepted

**Reclassification:** None

**Type:** Septic Tank

**Start Date:**

**End Date:**

**Description:** The waste site is an underground septic tank that services the A Tank Farm Pipefitters shop building.

**Location:** The 242-AC Pipefitter Shop is located near the corner of 4th Street and Buffalo Ave. in 200 East Area. The septic tank is located north of 242-AC.

### Code: 2607-EH

**Classification:** Accepted

**Reclassification:** Rejected (5/31/2001)

**Type:** Septic Tank

**Start Date:**

**End Date:**

**Description:** WIDS site 2607-EH has been described as a septic tank and associated drain field.

**Location:** This septic system has been described as being located on the west side of Baltimore Avenue adjacent to the east side of the 2101-M Building.
Waste Type: Process Effluent

Waste Description: According to the Hanford Site Waste Management Units Report (Cramer, 1987), the 2607-EH Septic System received sanitary wastewater and sewage from the 2101-M building at an estimated rate of 1.36 cubic meters (48.00 cubic feet) per day.

| Code: 2607-EJ | Classification: Accepted |
| Names: 2607-EJ; 2607-EJ Septic System | Reclassification: Closed Out (5/31/2001) |
| Type: Septic Tank | Start Date: |
| Status: Inactive | End Date: |

Description: The 2607-EJ Septic System was removed during the construction of the 241-AP Tank Farm. It was the original system that serviced the 272-AW building. The tank and drainfield were removed as part of the 50 foot deep excavation for the 241-AP Tank Farm.

The concrete septic tank was divided into two compartment with volumes of 7800 liters (2000 gallons) and a 3900 liters (1000 gallons). It measured 5.9 meters (19.5 feet) long, 2.1 meters (7 feet) wide, and 1.8 meters (6 feet) deep (outer dimensions). The tank had three 0.6 meter (2 foot) access ports which were covered with concrete lids. The tank was connected to a small concrete distribution box which routed the waste from the tank to the sanitary drainfield. The drainfield consisted of five 15 meter (50 foot) runs of perforated drain tile.

Location: The 2607-EJ Septic System was located east of 272-AW and west of tank 241-AP-103.

Related Sites/Structures: The 2607-EJ Septic System was associated with the 272-AW Building.

Process Description: The 2607-EJ Septic Tank and the associated drain field were designed to accept sanitary sewer effluent.

Waste Type: Process Effluent

Waste Description: The 2607-EJ Septic System received sanitary wastewater and sewage.

Closure Info: The reclassification to Closed Out is documented on form 2001-025. The 2607-EJ Septic System was removed during site preparation for the construction 241-AP Tank Farm. The tank and drainfield were in the layback for the 15 meter (50 foot) deep excavation for the tank farm.

| Code: 2607-EK | Classification: Accepted |
| Names: 2607-EK | Reclassification: Closed Out (5/31/2001) |
| Type: Septic Tank | Start Date: 1/1/1975 |
| Status: Inactive | End Date: 1/1/1997 |

Description: The 2607-EK Septic Tank is a reinforced concrete tank and posted in the field as "Septic Tank 2607EK." The associated drainfield is east of the tank. The drainfield is comprised of eleven parallel runs of 15 centimeter (6 inch) perforated drain pipe. The runs are 27 meters (90 feet) long and spaced 2.4 meters (8 feet) apart.

Location: The 2607-EK septic system is located east of Baltimore Avenue, northeast of the 2750-E building, and south of the 2607-E8 Septic System.

Related Sites/Structures: The 2607-EK Septic Tank is associated with the 2750-E Building.
**Process Description:** The 2607-EK Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2750-E Building.

**Waste Type:** Process Effluent

**Waste Description:** The 2607-EK septic system received sanitary sewer effluent from the 2750-E Building at an estimated rate of 39.2 cubic meters (1,384 cubic feet) per day.

**Closure Info:** The reclassification to Closed Out is documented on form 2001-031. The 2607-EK system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501.

---

**Code:** 2607-EL  
**Names:** 2607-EL; 2607-EL Septic Tank/Pump Station  
**Type:** Septic Tank  
**Status:** Active

**Description:** The site is surrounded with steel posts and chain. It is marked with Septic Tank signs. Three access ports are visible on the surface. This septic tank/pump station is a part of the 2607-EP System which was reconstructed in 1994. 2607-EL is permitted and approved by the Washington Department of Health for a flow of 54,890 liters per day.

**Location:** The site is located south of 4th Street, near the western entrance to 200 East Area. The septic system is located south of 2727-E and west of MO-294.

**Process Description:** The unit receives sanitary sewage from MO-286 and MO-294.

**Waste Type:** Steam Condensate

**Waste Description:** The waste is human sanitary sewage.

---

**Code:** 2607-EM  
**Names:** 2607-EM  
**Type:** Septic Tank  
**Status:** Active

**Classification:** Accepted  
**Reclassification:** None  
**Start Date:** 1/1/1984  
**End Date:**

**Description:** The site consists of the 2607-EM Septic Tank and pump station. The system is connected to the 2607-EP dosing chamber, which is connected to the 2607-EP Drainfield (soil absorption system).

**Location:** This unit lies northwest of the associated drain field and southeast of the 2721-E Building.

**Related Sites/Structures:** The 2607-EM Septic Tank is associated with the 2721-E Building.

**Process Description:** The 2607-EM Septic Tank and associated drain field receive sanitary sewer effluent from the 2721-E Building. The tank is constructed of reinforced concrete and receives sanitary wastewater and sewage from the 2721-E Building.

**Waste Type:** Process Effluent
The 2607-EM septic system receives sanitary sewer effluent from the 2721-E Building at an estimated rate of 217 cubic feet (6.14 cubic meters) per day.

The 2607-EP Septic System includes a septic tank and associated drainfield.

This unit is located inside 200 East Area, south of 4th Street. It lies southeast of the MO-388 and northeast of the 2721-E Building.

The 2607-EP Septic Tank and associated drain field are designed to accept sanitary sewer effluent from the 2607-EM, the 2607-EN, and the 2607-EO systems, as well as the 2721-EA building and the MO-388.

The 2607-EP Septic Tank is associated with systems 2607-EM, 2607-EN, and 2607-EO. Prior to 1994, this system (consisting of two underground tanks) received sanitary sewage effluent from the 2721-EA Building and the MO-388.

The 2607-EP Septic Tank is associated with systems 2607-EM, 2607-EN, and 2607-EO. Prior to 1994, this system (consisting of two underground tanks) received sanitary sewage effluent from the 2721-EA Building and the MO-388.

The 2607-EP Septic Tank is associated with systems 2607-EM, 2607-EN, and 2607-EO. Prior to 1994, this system (consisting of two underground tanks) received sanitary sewage effluent from the 2721-EA Building and the MO-388.

The 2607-EP system receives effluent from the 2721-EA Building and MO-388 at an estimated rate of 28.30 cubic feet (0.80 cubic meters) per day.

The 2607-EQ Septic Tank is constructed of reinforced concrete. The associated drainfield is approximately 4,644 square feet (431 square meters).

This unit lies northwest of the 2753-E Building and southeast of the Ames Avenue and Second Street intersection.

The 2607-EQ Septic Tank is associated with the 2751-E, the 2752-E, and the 2753-E Buildings, as well as the MO-276, the MO-277 and the MO-285.

The 2607-EQ Septic Tank and associated drain field are designed to accept sanitary sewer effluent from connected facilities (2571-E, 2752-E, 2753-E, MO-276, MO-277 and MO-285).

The 2607-EQ septic system receives sanitary sewage effluent at an estimated rate of 477 cubic feet (13.5 cubic meters) per day in 1987.

Hanford Site Waste Management Units Report
February 2015
**Status:** Inactive  
**End Date:** 1/1/1997

**Description:** The 2607-ER system was properly abandoned in 1997. It includes a septic tank and a trench type drain field. The tank has two access ports. As of February 20, 2001, it was not posted in the field.

**Location:** The site is located north of the 2101-M Building and west of Baltimore Avenue, just south of the railroad tracks.

**Related Sites/Structures:**
- The 2607-ER Septic Tank is associated with the MO-047, the MO-251, the MO-252, and the MO-253.

**Process Description:** The 2607-ER Septic Tank and associated drain field were designed to accept sanitary sewer effluent from connected facilities (MO-047, the MO-251, the MO-252, and the MO-253).

**Waste Type:** Process Effluent

**Waste Description:** The 2607-ER septic system received sanitary sewage effluent from the MO-047, the MO-251, the MO-252, and the MO-253 at an estimated rate of 5,753 liters (1,520 gallons) per day.

**Closure Info:** The reclassification to Closed Out is documented on form 2001-032. The system was abandoned in 1997 in accordance with Washington Administrative Code 246-272-18501. The facilities were connected to a new regional system designated 2607-E8A.

---

**Code:** 2703-E HWSA  
**Classification:** Accepted

**Names:** 2703-E HWSA; 2703-E Hazardous Waste Storage Area

**Type:** Storage Pad (<90 day)  
**Start Date:** 1/1/1984  
**End Date:** 1/1/1996

**Description:** The site was a hazardous waste storage area located in a three-sided steel shed. The shed is on a concrete pad. The site is currently in use as an equipment storage area. There is a metal cabinet in the shed that is used to hold non-regulated soiled shop rags for pickup by the laundry services.

**Location:** The site was located in a steel shed on the east side of 2703-E, north of the compressor building.

**Related Sites/Structures:**
- The 2703-E Hazardous Waste Staging Area was associated with the 2703-E Building.

**Process Description:** The 2703-E Hazardous Waste Staging Area was designed to temporarily store liquid hazardous waste before disposal.

**Waste Type:** Process Effluent

**Waste Description:** The 2703-E Hazardous Waste Staging Area typically contained wastes such as alkaline liquids, sodium hydroxide, sodium dichromate containing process solutions, and waste acids. Use of the 90-day waste storage pad was discontinued by November 4, 1996.

---

**Code:** 2704-E HWSA  
**Classification:** Accepted

**Names:** 2704-E HWSA; 2704-E Hazardous Waste Storage Area

_Hanford Site Waste Management Units Report_  
February 2015  
1844
Description: The site was an asphalt pad. It is no longer visible. The location is not marked or posted, and the area is now covered with grass.

Location: The 2704-E Hazardous Waste Staging Area was located southwest of the current MO-257 and northeast of the intersection of Atlanta Avenue and Fourth Street. This 2704-E building was located east of the 2711-E Garage, but has been demolished.

Related Sites/Structures: The 2704-E Hazardous Waste Staging Area was associated with the former 2704-E Building.

Process Description: The 2704-E Hazardous Waste Staging Area was designed to temporarily store hazardous materials before disposal.

Waste Type: Process Effluent

Waste Description: Typical liquid wastes contained at the 2704-E Hazardous Waste Staging Area included antifreeze, grease, diesel fuel, and asphalt.

description: The site consists of two french drains associated with the 2718-E Building. One of the french drains is not visible in the field. It was used to drain a swamp cooler, according to Hanford drawing H-2-44301. The other french drain is actually a pit used only to drain clean water from the fire sprinkler system at the 2718-E building. It has a metal lid. The inside is dry with a valved pipe in the bottom.

Location: The site is located north of 2718-E Building, inside the 209-E security fence.

Related Sites/Structures: The site is related to the 2718-E Building.

Process Description: One is used to drain a swamp cooler, the other drains clean water from the fire sprinkler system at the 2718-E. The fire system is a dry pipe system, needing occasional testing. After testing, the water must be drained. There are no other sinks, drains or other water sources going to these french drains.

Waste Type: Process Effluent

Waste Description: One french drain receives clean raw water from testing the fire system; the other received water from a swamp cooler when it was drained for the winter.

Code: 2715-EA HWSA

Classification: Accepted

Names: 2715-EA HWSA; 2715-EA Paint Spray Booth Annex; 2715-EA Hazardous Waste Storage Area

Recategorization: Rejected (9/14/2000)

Type: Storage Pad (<90 day)

Start Date: 1/1/1984

Status: Inactive

End Date: 

Description: The 2715-EA Hazardous Waste Staging Area is no longer active. All associated wastes have been removed. The area is currently used for storing new drums, excess material, scrap metal for recycling, non-regulated wastes, and flammable materials. The pad was in a shed, which is...
still standing, with a chain link fence as the front wall. Adjacent to the west side of the shed are two conex boxes and two chain-link fenced areas which are used as additional storage space. During a site visit on April 11, 2000, it was observed that the shed is labeled "No Smoking," "New Drum Storage" and "Danger - Items in this Building Contain Asbestos." The shed corresponds to the mapped location for building 2715-EA but the shed is not labeled with this number nor could any nearby building be located with this number. The shed contains primarily drums and also some packaged material sitting on a pallet. Material sitting on the concrete in front of the shed includes: other new drums, dollies for moving the drums, wooden boxes and metal cabinets. Some of the metal cabinets are marked "Excess." There are two conex boxes just west of the shed. These are marked "Conex 1" and "Conex 2." Conex 2 is closest to the shed. Both conex boxes have vents on the top. The area between the two conex boxes and the area between Conex 2 and the shed are fenced. The area between the two conex boxes is labeled "No Smoking or Open Flame" and "Non-regulated Waste Storage." The area between Conex 2 and the shed is labeled "Empty Drums to be Crushed for Scrap Metal." This second fenced area also contains two yellow metal cabinets marked "Flammable." Deford and Carpenter (1995) reported that one of these fenced areas was labeled with "Hazardous Waste 90-Day Storage" signs.

**Location:** This site is located northwest of the 275E Building and east of the 2715-ED Building.

**Process Description:** The 2715-EA Hazardous Waste Staging Area was designed to temporarily store hazardous waste related to the paint shop activities before disposal.

**Waste Type:** Process Effluent

**Waste Description:** The typical wastes held here were waste paint and thinning solvents.

**Classification:** Accepted

**Names:** 2607-FSN; 609A Building Septic Tank 2607-FSN; 6607-04; 6607-4

**Reclassification:** Closed Out (11/9/2004)

**Type:** Septic Tank

**Start Date:** 1/1/1960

**Status:** Inactive

**End Date:** 1/1/1988

**Description:** The 2607-FSN Septic Tank was properly abandoned in 1988. The tank and drainfield lie beneath an asphalt walkway and several trees.

**Location:** The 2607-FSN septic system was located at the southeast corner of the 609-A Building (200 Area Fire Station), which is located on the south side of Route 3 in the 600 Area.

**Related Sites/Structures:** The 2607-FSN system was associated with the 609-A Building.

**Process Description:** The 2607-FSN Septic Tank system received sanitary wastewater and sewage from the 609-A Building and disposed of it through a sub-surface soil absorption system.

**Waste Type:** Steam Condensate

**Waste Description:** The 2607-FSN septic system received sanitary wastewater at a rate of approximately 1,250 gallons (4,731 liters) per week.

**Closure Info:** The reclassification to Closed Out is documented on form 2004-113. The system was abandoned and replaced by the 6607-4 septic system in 1988. It also is tied into the 2607-EP tank.
**Code:** 2607-GF  
**Classification:** Accepted  
**Reclassification:** Rejected (5/31/2001)

**Names:** 2607-GF; 2607-GF Septic System; 2607-GF Septic Tank and Drain Field  
**Status:** Inactive  
**Start Date:**  
**End Date:**

**Description:** WIDS site 2607-GF was described in Cramer (1987) as a septic tank and associated drain field. However, it likely does not exist.

**Location:** This system has been described as being located north of the Dry Materials Receiving and Handling Facility (2400E) and across the railroad tracks that run on the north side of the facility.

**Waste Type:** Process Effluent  
**Waste Description:** According to the Hanford Site Waste Management Units Report (Cramer, 1987), the 2607-GF Septic System is not currently in use. This unit received sanitary sewage effluent from the Dry Materials Receiving and Handling Facility.

---

**Code:** 2101-M POND  
**Classification:** Accepted  
**Reclassification:** Closed Out (10/26/1995)

**Names:** 2101-M POND; 2101-M Pond  
**Type:** Pond  
**Status:** Inactive  
**Start Date:** 1/1/1953  
**End Date:** 1/1/1995

**Description:** The site RCRA TSD Permit was Closed Out in 1995. The pond was an unlined, "U" shaped ditch. It was surrounded with post and chain. Many tumbleweeds collected in this area.

**Location:** The pond was located west of the 2101-M Building.

**Related Sites/Structures:** The site is associated with the 2101-M building effluent discharges.

**Process Description:** The pond had been in service since 1953. The BWIP laboratory has been located in this building since 1983. Prior to the July 1985 initiation of administrative controls in the BWIP laboratory to prohibit discharge of hazardous waste, the 2101-M pond received laboratory waste solutions including solutions of barium chloride, and nitric and hydrochloric acids. The total amount of barium chloride discharged to the site is estimated to be more than 1 but less than 10 kg (2.7 to 27 lb) from 1983 to 1985. (The laboratory hazardous wastes are now collected for offsite disposal.) The inventory of items purchased for this laboratory includes about 300 chemicals and commercial chemical products. Between September 1985 and September 1986, approximately 860 kg (2,320 lb) of hazardous waste solutions were collected for disposal at the 2101-M laboratory. Similar annual amounts may have been discharged via the laboratory drains from 1983 until July 1985.

The pond became active in 1953 to receive swamp cooler water from the 2101-M air conditioning system, storm water run off and steam traps. In 1983, the Basalt Waste Isolation Project added some laboratories to the 2101-M building. The laboratory sinks also drained to the 2101-M Pond until 1985. In July 1985, administrative controls were implemented to prevent the discharge of regulated waste to the 2101-M Pond.

**Waste Type:** Process Effluent  
**Waste Description:** From 1953 until 1983, the pond received small volumes of swamp-cooler condensate, overflow drain wastewater from the 2101-M air conditioning system, steam trap condensate and storm water runoff. From 1983 to July 1984, approximately 1200 gallons of laboratory waste,
including as barium chloride solutions, nitric acid and hydrochloric acid, were discharged to the unit. Quantities are estimated at less than 1900 liters per year (500 gallons per year). Nitric acid and hydrochloric acid discharge quantities are estimated at 1 to 10 kilograms per year (2.2 to 22 pounds per year).

Closure Info: The site has been sampled and analyzed for hazardous components. The RCRA TSD unit was Clean Closed in accordance with the Washington Administrative Code (WAC) closure performance standards. The letter of acceptance from Ecology was received 10/30/1995.

Code: 212-N
Names: 212-N Building; 212-N Fissile Storage Facility; Metal and Fuel Storage Basin Facility
Type: Storage
Status: Inactive
Start Date: 1/1/1945
End Date: 1/1/1952
Description: The waste site was evaluated and reclassified to Rejected. The 212-N building was demolished under a CERCLA Removal Action in 2009. 212-N was composed of high bay, a fuel storage basin and a heater room. Each section has a concrete slab and roof and walls constructed of concrete and concrete block. Exterior dimensions of the high bay section is 8.2 by 23 by 9 meters (27 by 74 by 30 feet) high. The fuel storage basin section is 15 by 22 by 3.7 meters (49 by 72 by 12 feet) high. The heater room is 4.3 by 7.9 by 3.7 meters (14 by 26 by 12 feet) high. The total area is 555 square meters (5,970 square feet), the storage basin is 307 square meters (3,300 square feet), and the transfer basin is 37 square meters (400 square feet).

Location: The site was located north of Route 11A, halfway between the 200 East and 200 West Areas.

Process Description: From 1945 to 1952, the facility was used to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 6.1-meter (20-feet) reinforced concrete basins. In 1970, twenty four boxes of transuranic (TRU) contaminated laboratory hoods and equipment from the 300 Area Plutonium Recycle Test Reactor (PRTR) were placed in the facility for storage.

Waste Type: Process Effluent
Waste Description: From 1944 to 1952, the facility was used to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 6.1-meter (20-feet) reinforced concrete basins. In 1970, twenty four boxes of transuranic (TRU) contaminated laboratory hoods and equipment from the 300 Area Plutonium Recycle Test Reactor (PRTR) were placed in the facility for storage. There is estimated to be 40 gram (1.4 ounces) of plutonium (byproduct). The total waste volume is 2.7 cubic meters (7,651 cubic feet). The waste was removed in 2006 and 2007.

Closure Info: The basis for the reclassification of this site has been documented in the Response Action Report (RAR) for 212-N, 212-P, and 212-R Facilities Removal Action, DOE/RL-2010-031. Functions of this removal action as discussed in the Remedial Design/Remedial Action Work Plan for 200 North Area Waste Sites located in the 200-CW-3 Operable Unit (RAWP) included utility isolations, characterization sampling, hazardous material removal, decontamination, structure demolition, disposition of waste materials and site stabilization (DOE/RL-2007-55). Removal design included removal of the discrete structural components and removal of the soils up to a depth of 1 meter (3.3 ft) beneath the basin and transfer pit of each structure. According to the RAWP, decontamination and demolition activities were conducted within the footprint of each structure, defined as the area covered by the structure as seen from a plan view, plus an additional 30 meters (98 ft) out from the perimeter of the walls. No formal design
requirements were applicable to this removal action.

In accordance with the Sampling and Analysis Plan (DOE/RL-2007-54), focused discrete samples were collected at visually indicated (soil that appeared to be visually darker or a different color than surrounding soil) locations and areas expected to contain higher levels of contamination based on process knowledge. One visually indicated (discoloration at 212-R) and a total of 37 judgmental samples were collected, 11 from 212-N and 13 each from 212-P and 212-R as indicated in Appendix A of the RAR. Detailed analytical data values were provided in Appendix B of the RAR.

Soil sampling data did not contribute to the overall completion of the removal action for the 212-N, 212-P and 212-R facilities. Rather, it addressed the post demolition soil evaluation discussed in the RAWP and SAP by which the soil areas remaining in the locations of the removed structures were investigated against the interim cleanup standards developed for the collocated wastes sites in the 200-CW-3 Operable Unit. The evaluation serves an investigative purpose to determine if further remediation was needed. Results of this evaluation demonstrated that a waste site designation for these areas for further remediation is not applicable.

During the collection of focused soil samples, radiological surveys were performed of the sample matrix. Surveying was performed using standard radiological survey instruments in accordance with accepted protocols and procedures to obtain dose and contamination measurements. No elevated dose rates (dose rates above established area background) were encountered to be further investigated.

Reclassification:
212-P; 212-P Building PCB Storage Facility; 212-P Storage Facility

Classification: Accepted
Reclassification: Rejected (5/18/2010)

Code: 212-P
Names: 212-P; 212-P Building PCB Storage Facility; 212-P Storage Facility
Type: Storage
Status: Inactive
Start Date: 1/1/1945
End Date: 

Description: The waste site has been evaluated and reclassified to Rejected. The 212-P building was demolished under a CERCLA Removal Action in 2009. The building was composed of two main sections (High Bay and low roof sections) and a heater room. Each section had a concrete slab floor and walls constructed of concrete and concrete block.

Location: The site was located north of Route 11A, halfway between 200 East and 200 West areas.

Related Sites/Structures: Associated with pipeline 600-286-PL, 216-N-4 and 216-N-5

Process Description: From 1944 to 1952 the facility was used to store irradiated fuel rods prior to chemical processing in the 200 Areas. In 1982, the facility began to be used for storage of electrical transformers contaminated with PCB's. Shipments were made from the facility quarterly or as necessary to comply with the TSCA 9-month storage limitation. The High Bay portion of the building was used to store equipment and a 10,000 gallon tank of oil. The oil tank was placed on a "drip pan" secondary containment. A Dyncorp employee reported that the equipment and oil tank stored inside the High Bay has been removed.

Waste Type: Equipment
Waste Description: Originally, the unit was built to provide underwater storage of irradiated slugs from the 100 Areas. Slugs were stored in the 20-ft reinforced concrete basins.

Waste Type: Equipment

Waste Description: Since 1982, this unit has held PCBs, and PCB-contaminated waste (nonradioactive) in temporary (up to 9 months) storage, according to TSCA (Toxic Substance Control Act). Radioactively contaminated PCBs are stored in another area of this unit. Waste types include 854 kg oil less than 50 p/M PCB; 1,348 kg oil greater than 50 p/M PCB; 703 PCB light ballasts, overpacked; 1,159 kg oil greater than 500 p/M PCB; 7 sealed transformers with less than 30 p/M PCB oil; 1 capacitor with 1% PCB askarel fluid; 11 low-voltage capacitors with greater than 50 p/M PCB oil; 2 electron microscope power supplies with greater than 50 p/M PCB oil; and 42 kg regulated solvents with greater than 500 p/M PCB. Drained items (as allowed under TSCA) are occasionally stored on an asphalt pad at the southwest corner of the building.

Closure Info: The basis for the reclassification of this site has been documented in the Response Action Report (RAR) for 212-N, 212-P, and 212-R Facilities Removal Action, DOE/RL-2010-031. Functions of this removal action as discussed in the Remedial Design/Remedial Action Work Plan for 200 North Area Waste Sites located in the 200-CW-3 Operable Unit (RAWP) included utility isolations, characterization sampling, hazardous material removal, decontamination, structure demolition, disposition of waste materials and site stabilization (DOE/RL-2007-55). Removal design included removal of the discrete structural components and removal of the soils up to a depth of 1 meter (3.3 ft) beneath the basin and transfer pit of each structure. According to the RAWP, decontamination and demolition activities were conducted within the footprint of each structure, defined as the area covered by the structure as seen from a plan view, plus an additional 30 meters (98 ft) out from the perimeter of the walls. No formal design requirements were applicable to this removal action.

In accordance with the Sampling and Analysis Plan (DOE/RL-2007-54), focused discrete samples were collected at visually indicated (soil that appeared to be visually darker or a different color than surrounding soil) locations and areas expected to contain higher levels of contamination based on process knowledge. One visually indicated (discoloration at 212-R) and a total of 37 judgmental samples were collected, 11 from 212-N and 13 each from 212-P and 212-R as indicated in Appendix A of the RAR. Detailed analytical data values were provided in Appendix B of the RAR.

Soil sampling data did not contribute to the overall completion of the removal action for the 212-N, 212-P and 212-R facilities. Rather, it addressed the post demolition soil evaluation discussed in the RAWP and SAP by which the soil areas remaining in the locations of the removed structures were investigated against the interim cleanup standards developed for the collocated wastes sites in the 200-CW-3 Operable Unit. The evaluation serves an investigative purpose to determine if further remediation was needed. Results of this evaluation demonstrated that a waste site designation for these areas for further remediation is not applicable.

During the collection of focused soil samples, radiological surveys were performed of the sample matrix. Surveying was performed using standard radiological survey instruments in accordance with accepted protocols and procedures to obtain dose and contamination measurements. No elevated dose rates (dose rates above established area background) were encountered to be further investigated.
The waste site has been evaluated and reclassified to Rejected. The 212-R building was demolished under a CERCLA Removal Action in 2009. 212-R was composed of two main sections (the High Bay and the basin storage section) and a heater room. Each section has a concrete slab foundation and roof. The walls are constructed of concrete and concrete block.

Location:
The site was located north of Route 11A, halfway between the 200 East and 200 West Areas.

Process Description:
The 212-R Storage Facility was originally built to provide underwater storage of irradiated fuel rods from the 100 Areas. The fuel rods were allowed to decay in water filled basins (20 feet deep) before being sent to the 200 Areas for processing.

Waste Type:
Storage Tank

Waste Description:
The building and equipment within it may be contaminated. A 1988 Internal Memo related to the Strontium SemiWorks HEPA Filter 2 stored at 212-R states that the filter contains 9.0 mCi of Sr-90 and 185 uCi of Cs-137.

Closure Info:
The basis for the reclassification of this site has been documented in the Response Action Report (RAR) for 212-N, 212-P, and 212-R Facilities Removal Action, DOE/RL 2010-031. Functions of this removal action as discussed in the Remedial Design/Remedial Action Work Plan for 200 North Area Waste Sites located in the 200-CW-3 Operable Unit (RAWP) included utility isolations, characterization sampling, hazardous material removal, decontamination, structure demolition, disposition of waste materials and site stabilization (DOE/RL 2007 55). Removal design included removal of the discrete structural components and removal of the soils up to a depth of 1 meter (3.3 ft) beneath the basin and transfer pit of each structure. According to the RAWP, decontamination and demolition activities were conducted within the footprint of each structure, defined as the area covered by the structure as seen from a plan view, plus an additional 30 meters (98 ft) out from the perimeter of the walls. No formal design requirements were applicable to this removal action.

In accordance with the Sampling and Analysis Plan (DOE/RL-2007-54), focused discrete samples were collected at visually indicated (soil that appeared to be visually darker or a different color than surrounding soil) locations and areas expected to contain higher levels of contamination based on process knowledge. One visually indicated (discoloration at 212-R) and a total of 37 judgmental samples were collected, 11 from 212-N and 13 each from 212-P and 212-R as indicated in Appendix A of the RAR. Detailed analytical data values were provided in Appendix B of the RAR.

Soil sampling data did not contribute to the overall completion of the removal action for the 212-N, 212-P and 212-R facilities. Rather, it addressed the post demolition soil evaluation discussed in the RAWP and SAP by which the soil areas remaining in the locations of the removed structures were investigated against the interim cleanup standards developed for the collocated wastes sites in the 200-CW-3 Operable Unit. The evaluation serves an investigative...
purpose to determine if further remediation was needed. Results of this evaluation demonstrated that a waste site designation for these areas for further remediation is not applicable.

During the collection of focused soil samples, radiological surveys were performed of the sample matrix. Surveying was performed using standard radiological survey instruments in accordance with accepted protocols and procedures to obtain dose and contamination measurements. No elevated dose rates (dose rates above established area background) were encountered to be further investigated.

**Code:** 203-S & 205-S  
**Classification:** Accepted  
**Reclassification:** Consolidated (1/19/2005)

**Names:** 203-S & 205-S; 203-S Uranyl Nitrate Hexahydrate Tank Farm; 204-S; 204-S Tank Farm & Pumphouse; 205-S Process Vault & Chemical Makeup Building; 205-S Stabilized Area; 205-S Uranyl Nitrate Hexahydrate Processing Facility; 203-S

**Type:** Process Unit/Plant  
**Start Date:** 1/1/1953  
**End Date:** 1/1/1965

**Status:** Inactive  
**Description:** The aboveground tanks and features of these facilities were removed in 1983. The area was backfilled and surface stabilized. The site is currently a posted Underground Radioactive Material area.

**Location:** The facilities were located northwest of the 202-S (REDOX) facility.

**Related Sites/Structures:** Structures associated with this site include the remains of the 205-S Chemical Makeup System, the 203-S Secondary Containment, the 205-S Vault, the above ground (dismantled) uranyl nitrate hexahydrate cross site transfer line, underground utilities, the salvaged or decommissioned tanks, and process equipment. It is also associated with 200-W-22 and unplanned releases UPR-200-W-10, UPR-200-W-83, UPR-200-W-86 and UPR-200-123.

**Process Description:** The 203, and 205-S Facilities were constructed in the early 1950's as a process unit for the decontamination of uranyl nitrate hexahydrate (UNH) produced by Reduction Oxidation (REDOX) operations. The primary process unit consisted of a column filled with silica gel that removed traces of fission products from the UNH. The silica gel column (SG-1) was located in the underground 205-S vault. The vault also contained a waste neutralization tank. Operations in the vault were accomplished remotely. The 205-S facility was a two story, aboveground, chemical make-up building. It contained two chemical make-up tanks, a UNH sample room and extensive piping connected to the REDOX facility and the underground vault. The 203-S facility was an aboveground UNH storage facility that consisted of two 19,000 liter (5,000 gallon) stainless steel tanks that were set in an open concrete basin. There was also a 204-S Tank Farm, that consisted of four 190,000 liter (50,000 gallon) aboveground tanks set in two open concrete basins. A UNH Unloading Facility was located at the adjacent railroad siding. An aboveground UNH pipeline connected the 203-S, 204-S, 205-S Area to the 224-U (UO3 Plant). During the REDOX Plant operation, the UNH solution was pumped from REDOX to the 205-S silica gel column for purification. The purified UNH was stored in the 203 and 204 tanks and the routed to 224-U, via an above ground line, for final processing. The fission products left in the silica gel column were stripped out with nitric acid. The acid was neutralized and sent to cribs. UNH from the PUREX Plant were transported by truck to the unloading station and placed in the 204-S tanks. The PUREX solutions were then processed through the silica gel column. After REDOX shut down (1965), the 203-S and 205-S were placed on standby. The Unloading Station was converted to a railcar unloading station. The 204-S tanks continued to store material from the Unloading Station. Shipments included thorium nitrate, 100-N Reactor decontamination solutions and 300 Area Laboratory wastes.

*Hanford Site Waste Management Units Report*  
February 2015
**Waste Type:** Process Effluent

**Waste Description:** Waste processed and stored in this area included contaminated UNH from REDOX and PUREX, Thorium Nitrate from PUREX, 100-N Reactor decontamination waste and 300 Area Laboratory waste. Radiological contaminants may be present in and around the remaining contaminated structures (cement basins and piping) that were not removed in the 1983 stabilization efforts.

**This Site Was Consolidated With:**

**Code:** 200-W-22  
**Names:** 200-W-22; 203-S/204-S/205-S Stabilized Area

---

**Code:** 219-S-101  
**Classification:** Accepted  
**Reclassification:** None  
**Start Date:** 1/1/1951

**Names:** 219-S-101; 219-S-TK-101; TK-101 Crib Waste Receiver; TK-101 Receiver Tank; 219-S

**Type:** Storage Tank  
**Status:** Active

**Description:** The 219-S-101 Tank is a monitored stainless steel receiver tank resting in a below grade concrete vault at the 219-S Waste Handling Facility.

**Location:** The tank is located in the north side of Cell A in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.

**Related Sites/Structures:** The tank is associated with the other two 219-S Tanks, transfer lines, and the 222-S Laboratory (200-W-69).

**Process Description:** The 219-S-101 Tank receives liquid mixed waste from the 222-S Laboratory processes. Waste batches from Tank 219-S-101 and 219-S-104 are pumped to Tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.

The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

**Waste Type:** Storage Tank

**Waste Description:** The unit receives liquid mixed waste from the 222-S Analytical Laboratory processes. The waste is transferred to Tank 219-S-TK-102 for treatment with sodium hydroxide and sodium nitrate.

**Code:** 219-S-102  
**Classification:** Accepted  
**Reclassification:** None  
**Start Date:** 6/1/1951

**Names:** 219-S-102; 219-S-TK-102; 219-S Primary Treatment Tank TK-102; 219-S Storage Tank 102

**Type:** Neutralization Tank  
**Status:** Active  
**End Date:**
Description: The 219-S-102 Tank is a monitored stainless steel treatment and transfer tank resting in a below grade concrete vault at the 219-S Waste Handling Facility.

Location: The tank is located in a below grade concrete vault in the south side of Cell A in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.

Related Sites/Structures: The tank is associated with the other two 219-S Tanks, transfer lines, the double-shell tank farms, and the 222-S Laboratory (200-W-69).

Process Description: The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Waste batches from tanks 219-S-101 and 219-S-104 are pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.

Waste Type: Storage Tank

Waste Description: The unit receives high activity mixed waste from the 222-S Laboratory processes. The waste is normally transferred from Tanks 101 and 104 for treatment. The waste is treated with sodium hydroxide to a pH greater than 12 and sodium nitrite to a concentration greater than 600 parts per million.

Description: The 219-S-103 Tank is a monitored stainless steel receiver tank resting in a below grade concrete vault at the 219-S Waste Handling Facility.

Location: The tanks are located in a below grade concrete vault in the south side of Cell B in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.

Related Sites/Structures: The tanks are associated with the other two 219-S Tanks, transfer lines, the double-shell tank farms, and the 222-S Laboratory (200-W-69).

Process Description: The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

Tank 103 and its replacement tank 104 began service in 1996. Tank 103 was removed from service, blanked off, and left in place in 1999. They are both monitored stainless steel treatment and transfer tanks resting in a below grade concrete vault at the 219-S Waste Handling Facility.
The 219-S-103 Tank used to receive high activity liquid mixed waste from the 222-S Laboratory processes. Waste batches from tanks 219-S-101 and 219-S-103 were pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite were added to treat the waste. Tank 219-S-102 then pumped the waste to the double-shell tank farms. A 3.5 foot diameter (3 foot high) off gas filter is above 219-S-103. Drawing H-2-5234 labels the off gas filter tk-105.

Waste Type: Process Effluent
Waste Description: Tank 104 receives liquid mixed waste from the 222-S Analytical Laboratory processes. The waste is transferred to Tank 219-S-TK-102 for treatment with sodium hydroxide and sodium nitrite. Tank 103 used to receive high activity liquid mixed waste, that was then transferred to Tank 219-S-102 for treatment before being sent to the double-shell tank farms for storage.

<tr>
<td>Location:</td>
<td>The tanks are located on the south side of Cell B in the 219-S Building. The 219-S Building is located north of the northeast end of the 222-S Building.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process Description:</td>
<td>The 219-S tanks provide storage for hazardous and mixed waste. Tank 104 began service in 1996. Tank 219-S-104 replaced 219-S-103, which was removed from service and isolated. Similar to previous Tank 103 operations, Tank 104 receives liquid mixed waste, also from the 222-S Laboratory processes. Waste batches from tank 219-S-101 and 104 are pumped to tank 219-S-102, where sodium hydroxide and sodium nitrite are added to treat the waste. Tank 219-S-102 then pumps the waste to the double-shell tank farms.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The 219-S facility was built in the early 1950s as part of the 222-S liquid waste disposal system. 219-S originally consisted of three tanks (tanks 101, 102 and 103), enclosed in an epoxy coated, underground concrete vault. The vault has two cells. Cell A contains tanks 101 and 102. Cell B contains tanks 103 and 104. Tanks 101 and 103 (103 was later replaced with tank 104) collect and store liquid waste from the 222-S laboratory. When enough waste was collected, it is transferred to tank 102 and sampled, prior to being transferred to the tank farms. Prior to 1989, waste was transferred to the tank farm via underground lines, routed through 202-S. After 1989, the waste was transported to the tank farm via tank trailer trucks.

</tr>
</tbody>
</table>
Process Description: From 1978 to 1980 the facility was used as a demonstration project for decommissioning of contaminated facilities. Between 1963 and 1967 the facility was used to concentrate neptunium and plutonium nitrate solutions from REDOX. Prior to 1963 the facility provided the final purification and concentration of plutonium solutions using ion exchange technologies. The 233-S Plutonium Concentration Facility was an inactive (retired) limited access facility after 1967. The building was a reinforced concrete and structural steel assembly with corrugated steel and concrete walls. The building had eight rooms, an airlock, and a highbay area. These rooms were divided into two zones by a vertical partition of transparent plastic and structural steel. The two zones include a process area and a process viewing area.

Waste Type: Storage Tank
Waste Description: Piping insulation, wire insulation, and ventilation components may be insulated with asbestos containing materials. Transite is used on certain building components.

Waste Type: Storage Tank
Waste Description: Process equipment, systems, and building surfaces may have fixed and removable contamination as a result of processing and UPR-200-W-57.

Waste Type: Storage Tank
Waste Description: Chemical and radiological contaminants may still be present as residual materials in building systems.

Code: 241-S-302B
Names: 241-S-302B; 241-S-302-B Catch Tank; IMUST; Inactive Miscellaneous Underground Storage Tank
Type: Catch Tank
Status: Inactive
Start Date: 1/1/1952
End Date: 1/1/1985
Description: This unit is a horizontal, cylindrical steel tank. Tank 241-S-302B is underground to provide radiation shielding protection. The tank is surrounded with posts and chain and labeled with IMUST signs.
Location: The 241-S-302B Catch Tank is located east of tank 241-S-101, south of tank 241-SY-102 and southwest of tank 241-SY-103, inside the tank farm fence.
Related Sites/Structures: The 241-S Tank Farm and 241-S-151 Diversion Box are associated with this unit.

Waste Type: Equipment
Waste Description: This unit was used for transfer of waste solutions from processing and decontamination operations. Volumes were variable according to specific plant operations.

Code: 242-S
Names: 242-S; 242-S Evaporator
Type: Evaporator
Status: Inactive
Start Date: 1/1/1973
End Date: 1/1/1985
Classification: Accepted
Reclassification: None
The 242-S Evaporator is an inactive waste management unit. The principal operating areas of the evaporator include two adjoining, but structurally independent sections. Structure A, the processing and service area, is constructed of reinforced concrete shear walls and slab floors. Structure B of the building houses operating and support areas and is constructed of concrete block walls and structural steel.

The site is located directly north of Tank 241-S-103 and lies outside the 241-S Tank Farm.

The structures associated with this facility include tanks 242-S-TK-C-100 and 242-S-TK-1, the 241-S Tank Farm, the 216-U-14 Ditch, the 216-S-25 crib, pipeline 200-W-161-PL, the HVAC Pad south of the building, and internal process equipment.

The evaporation process reduced the volume of radioactive liquid by removing the water. The cooled vapor formed saltcake and residual liquor. This facility is currently in Condition III Standby, and the "B" Structure is used as a shift office for Tank Farms Operations Personnel. The "242-S Facility Shutdown/Standby Plan" provides a list of isolation work accomplished including pipelines that were blanked and equipment removed. Prior to 1980, the system was used to reduce the volume of radioactive liquid waste by evaporating water from the feed solution to produce a concentrated saltcake solution. The process condensate was sent back to the tanks. In 1985, a portion of the facility was used to process contaminated groundwater from the 216-U-1 and 216-U-2 crib area via the ion exchange column.

The unit received liquid radioactive mixed waste from the single-shell tanks through 1980. The evaporation process reduced the volume of radioactive liquid by removing the water. The cooled vapor formed saltcake and residual liquor.

The 276-S Building is a concrete and steel building, with transite siding on the portions of the building constructed of steel frame. The floor of the building is below grade, making up the processing area. Tanks and pumps make up most of the process equipment in the building.

The building is located north of the 211-S Tanks and south of the 276-S-141 and 276-S-142 Hexone Tanks.

Structures associated with the site include several tanks and pumps inside the building, solvent transfer lines, the 211-S Tank Farm, and the 276-S-141 and -142 Solvent Storage Tanks.

The 276-S Facility provided for the storage and treatment of REDOX process solvent (methyl isobutyl ketone).

This unit contains contaminated surfaces inside pumps, pits, and tanks. No inventory has been determined. Hexone contamination may also be present in building systems.
### Code: 291-S

#### Classification: Not Accepted

#### Names: 291-S; 291-S Fan and Filter Building; 291-S Fan Control Building; 291-S Fan House

#### Type: Process Unit/Plant

#### Status: Active

#### Description:
The 291-S fan house is an above ground concrete structure with outside dimensions of 4.2 meters by 6 meters (14 feet by 20 feet) and contains the blowers for the REDOX main ventilation system.

TPA-MP-14, Rev. 2, Section 2.0 states that WIDS does not document buildings or facilities that do not contain TSD units. Therefore, this has been classified as Not Accepted. It further states that, after buildings are demolished, the footprint will be evaluated for potential soil contamination. If present, the soil contamination will be added to WIDS as a Discovery Site.

#### Location:
The fan house is located adjacent to and southeast of the 291-S Stack.

#### Related Sites/Structures:
The 291-S-1 Stack and sand filter are associated with the unit.

#### Waste Type: Process Effluent

#### Waste Description:
The unit received exhaust air from the 202-S Process Building. The fans have very low levels of radiological contamination.

---

### Code: 291-S-1

#### Classification: Not Accepted (Proposed)

#### Names: 291-S-1; 291-S-1 Stack; REDOX Process and Canyon Exhaust; 202-S Stack

#### Type: Stack

#### Status: Active

#### Description:
The unit is a double-shell structure. The outer shell is made of reinforced concrete and the inner shell is constructed of acid-resistant brick and mortar.

#### Location:
The stack is located northeast of the 202-S Building.

#### Release Description:
During the operation of the REDOX Facility, multiple stack emissions occurred causing areas of surface contamination. Most of the emissions consisted of short lived radionuclides.

#### Related Sites/Structures:
The sand filter and fan house are associated with the unit.

#### Waste Type: Process Effluent

#### Waste Description:
The stack exhausts filtered air from the 202-S Process Building.

---

### Code: 292-S

#### Classification: Accepted

#### Names: 292-S; 292-S Jet Pit House Building

#### Type: Process Unit/Plant

#### Status: Inactive

#### Start Date: 1/1/1952

#### End Date: 1/1/1967

---

*Hanford Site Waste Management Units Report*

February 2015
Description: The unit is a concrete building. The 292-S Jet Pit House was in service from 1952 to 1967 to provide housing for the jets for the Reduction Oxidation (REDOX) process vessel vent systems. It contains radioactively contaminated surface on the tanks and piping with in the building.

Location: The site is east of the 202-S Building.

Waste Type: Process Effluent

Waste Description: The unit contains radioactively contaminated surfaces on tanks, piping, and concrete (preliminary estimate is 4 curies beta).

---

Description: The 293-S Off Gas Treatment building is a reinforced concrete structure. It is internally contaminated.

Location: The site is located east of the 202-S Building.

Process Description: From 1958 through 1967 the building absorbed nitrogen oxides and volatile fission products from the REDOX dissolver gasses.

Waste Type: Process Effluent

Waste Description: This unit and structure are radioactively contaminated.

---

Description: The unit is constructed of metal, and it extends from grade level to 1.8 meters (6 feet) above the roof.

Location: The stack is attached to the outside south wall of the service portion of the south pipe gallery of 202-S.

Related Sites/Structures: The stack is associated with the 202-S facility.

Waste Type: Chemicals

Waste Description: The unit contains surface radioactive contamination, exact amount unknown (1,000 counts/minute beta/gamma direct). The unit discharged filtered air from the south sample gallery and sample hoods of 202-S.

**Description:** The 233-SA building and stacks were demolished in 2004. The waste site consisted of two stacks, constructed of metal, extending from the fan base to above the 233-SA roof level. The units included a six meter (20 feet) intake duct and two electric drive fans. The systems were operated one at a time and were alternated weekly. The stacks were removed when the building was demolished.

**Location:** The stacks were located on the outside north wall of the 233-SA building.

**Related Sites/Structures:** The stacks are associated with the 233-SA building.

**Process Description:** The stacks were constructed to exhaust filtered air from the 233-S Building, the REDOX plutonium processing greenhouse, the process vessel ventilation and load out area.

**Waste Type:** Chemicals

**Waste Description:** The stacks contained an unknown amount of radioactive contamination. The units discharged air from 233-S.

### 2727-S Nonradioactive Dangerous Waste Storage Facility

**Classification:** Accepted  
**Reclassification:** Closed Out (6/27/1995)

**Names:** 2727-S; 2727-S Nonradioactive Dangerous Waste Storage Facility; 2727-S NRDWS Facility

**Type:** Storage  
**Start Date:** 1/1/1983  
**End Date:** 1/1/1995

**Description:** The 2727-S Nonradioactive Dangerous Waste Storage Facility (TSD unit) provided container storage for nonradioactive dangerous and extremely hazardous wastes generated in research and development laboratories, process operations, and maintenance and transportation functions through the Hanford Site. All waste containers have been removed from the facility and sent to an offsite RCRA Treatment, Storage, and/or Disposal (TSD) site. The metal building and its surrounding concrete pad have been demolished and removed in 1992. Some piles of dirt and asphalt rubble that appear to be left over from cleanup operations remain. The RCRA TSD permit was Closed Out in 1995.

**Location:** The 2727-S facility is located in the southeast portion of the 200 West Area, northeast of 202-S, south of U-Plant and west of Beloit Avenue.

**Process Description:** The facility stored waste from March 14, 1983 to December 30, 1986, but was considered an active waste site until the Treatment, Storage, and/or Disposal (TSD) unit was officially closed in 1995.

**Waste Type:** Steam Condensate  
**Waste Description:** Piles of dirt and asphalt rubble that appear to be left over from cleanup operations still remain at the site.

**Waste Type:** Steam Condensate  
**Waste Description:** The unit was used for storage of nonradioactive dangerous and extremely hazardous wastes generated on the Hanford Site. The wastes consisted of listed wastes, wastes from nonspecific sources, characteristic wastes, and state-only wastes.

**Closure Info:** In order to minimize closure costs related extensive sampling, it was decided to dispose of the
structures and the first 15 centimeters (6 inches) of soil immediately beneath the structures as WT02, Washington State dangerous waste. Closure verification sampling consisted of sampling substructure soils that would remain after demolition and after the planned soil removal. Sampling was performed prior to site demolition to prevent disturbing the underlying soil. Samples B07531 through B07562 were taken in support of closure activities. A sketch showing sampling locations and tables showing sample results are available in WHC-SD-EN-TI-242, Rev. 0B.

Demolition of the metal building and concrete storage pad began immediately upon the completion of sampling. The bulk of the demolition waste was taken to an offsite RCRA landfill in September 1992.

The RCRA TSD was closed in 1995.

| Code: 233-SA | Classification: Not Accepted |
| Names: 233-SA; 233-SA Exhaust Filter Building |
| Type: Process Unit/Plant | Start Date: 1/1/1967 |
| Status: Inactive | End Date: |
| Description: The above ground 233-S and 233-SA building structured were demolished in 2003 and 2004. A concrete cap was placed over the foundations. The area was then covered with gravel. A locked chain link fence surrounds the area. The fenced area is posted with Underground Radioactive Material Area signs. |
| Location: The 233-SA Building was located at the northwest corner of 233-S. |
| Related Sites/Structures: Structures associated with this system include the exhaust system, the 233 Building and 200-W-253. |
| Process Description: The building handled the ventilation for the 233-S Facility. It was a one-story reinforced concrete structure. The building housed two banks of double high-efficiency particulate air (HEPA) filters. Each filter bank has its own exhaust fan, stack, and monitoring instrumentation. |
| Waste Type: Misc. Trash and Debris |
| Waste Description: The system contained process equipment contaminated with plutonium and americium derived from 233-S Building operations. |

| Code: 2904-SA | Classification: Accepted |
| Names: 2904-SA; 2904-SA Cooling Water Sampler Building; 2904-SA Sample Building |
| Type: Process Unit/Plant | Start Date: 1/1/1956 |
| Status: Inactive | End Date: 1/1/1976 |
| Description: The waste site has been reclassified to Rejected. TPA-MP-14, Rev. 2, Section 2.0 states that WIDS does not document buildings or facilities that do not contain TSD units. It further states that, after buildings are demolished, the footprint will be evaluated for potential soil contamination. If present, the soil contamination will be added to WIDS as a Discovery Site. 2904-SA Sample Building is a prefabricated metal structure resting on a concrete foundation. It is located over the southern portion of the 2904-S-170 Control Structure. Process equipment within the building includes a pump, a stainless steel tank (below grade), and a sample riser that
extends through the floor of the building. The exterior of the building is posted with Contamination Area and Danger-Restricted Access signs.

**Location:** The building is located southwest of the 202-S canyon facility, near the southwest corner of the 211-S tank farm.

**Related Sites/Structures:** The sample building is associated with the 2904-S-170 Weir and the process line connected to the weir.

**Process Description:** The sample shack was built to provide sampling of process waste from the REDOX facility prior to being routed through the 2904-S-170 Weir to liquid waste disposal sites. The building extends 0.97 meters (3 foot 2 inches) over the south end of the 2904-S-170 Weir.

**Waste Type:** Chemicals

**Waste Description:** This unit contains trace amounts of low-level radioactive surface contamination derived from the process effluents sampled in this building.

| Description:   | The 222-S Dangerous Waste and Mixed Waste Storage Area (DMWSA) is a permitted treatment, Storage, and Disposal (TSD) area. It consists of two storage buildings (HS-0082 and HS-0083). The storage buildings are self-contained units with fire suppression and air conditioning, and are equipped with secondary containment. The site also includes portions of the concrete pad, which was previously used for the conex boxes in the DMWSA. The units and pad will be removed at closure under the Part B permit. |

| Location:      | The unit is located adjacent to the north of the 222-S Laboratory. |

| Related Sites/Structures: | Structures associated with this unit include the waste generating facilities in the 222-S Laboratory complex. |

| Process Description: | The unit provides temporary storage for liquid and solid waste generated by the 222-S Laboratory complex. This waste includes dangerous and mixed waste. |

| Waste Type:          | Process Effluent |

| Waste Description:   | Wastes generated from 222-S Analytical and 222-SA Standards Laboratories are stored in the unit. This consists of dangerous and mixed waste. |

| Description:   | The 241-SY-A Valve Pit is fabricated from reinforced concrete. All concrete and ferrous materials are treated with a protective coating. This unit has two cover blocks with valve handles extending through penetrations in the cover blocks. |

---

*Hanford Site Waste Management Units Report*

February 2015
**Location:**
This unit is located inside the 241-SY Tank Farm south of and between Tanks 241-SY-101 and 241-SY-102.

**Related Sites/Structures:**
The 241-SY Tank Farm is associated with this unit. Additional facilities associated with the 241-SY-A Valve Pit include the 244-S, 242-S, and 244-U Facilities.

**Process Description:**
This unit is used to route waste solutions to and from the 241-SY Tank Farm.

**Waste Type:**
Process Effluent

**Waste Description:**
The unit transports waste solutions from processing and decontamination operations. Quantities are variable according to specific plant operations. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

### Code: 241-SY-B
#### Classification: Accepted
#### Reclassification: None
#### Start Date: 1/1/1977
#### End Date: 

#### Type: Valve Pit
#### Description: The 241-SY-B Valve Pit is fabricated from reinforced concrete. All concrete and ferrous materials are treated with a protective coating. This unit has two cover blocks with valve handles extending through penetrations in the cover blocks.

#### Location: This unit is located inside the 241-SY Tank Farm south of and between Tanks 241-SY-101 and 241-SY-102.

#### Related Sites/Structures: The 241-SY Tank Farm is associated with this unit. Additional facilities associated with the 241-SY-B Valve Pit include the 244-S, 242-S, and 244-U Facilities.

#### Classification: Accepted
#### Reclassification: None
#### Start Date: 1/1/1977
#### End Date: 

#### Type: Double-Shell Tank
#### Description: This unit is fabricated as three concentric tanks. The primary tank and secondary tank are made of carbon steel with the secondary tank being larger in diameter than the primary tank. The space between the carbon steel tanks is referred to as the annulus. The third tank is a concrete shell that encloses both the primary and secondary tanks for additional containment, radiation shielding, and structural support. The 241-SY-101 Double Shell Tank is underground to provide shielding from radiation.

#### Location: The 241-SY-101 Double Shell Tank is located southeast of the 242-S Evaporator and within the Hanford Site Waste Management Units Report
February 2015
241-SY Tank Farm.

**Related Sites/Structures:** Structures associated with tank 241-SY-101 include the ventilation system, cover blocks on the access pits, and risers.

**Process Description:** This unit is used to store Tank Farms processing and operational waste.

**Waste Type:** Process Effluent

**Waste Description:** Waste transferred to this unit includes double-shell slurry, and radioactive mixed waste from tanks 241-SY-102, 241-SX-106, and 241-U-111.

---

241-SY Tank Farm.

**Related Sites/Structures:** Structures associated with tank 241-SY-103 include the ventilation system, cover blocks on the access pits, and risers.

**Process Description:** This unit stores waste from the 241-S and SY Tank Farms and from the 242-A Evaporator.

**Waste Type:** Water

**Waste Description:** The unit received supernatant containing complexed waste and double-shell slurry from 241-S and -SY tanks from the 242-A Evaporator.

**Code:** 221-T CSTF  
**Classification:** Accepted

**Names:** 221-T CSTF; 221-T Head End; T Plant Laboratory; 221-T Containment System Test Facility

**Reclassification:** Closed Out (2/22/1999)

**Type:** Laboratory

**Status:** Inactive

**Start Date:** 1/1/1964

**End Date:**

**Description:** The 221-T CSTF consisted of the head end (Section 1) of the 221-T Canyon. In 1964, a sheet metal wall was constructed to separate Section 1 from the rest of the canyon. The head end area consists of one large process cell, a control room, laboratories, a shop, a change room, and a high bay near the cell.

**Location:** The 221-T CSTF is located at Section 1 of the 221-T Building.

**Related Sites/Structures:** Structures associated with the 221-T CSTF included the containment vessel, tanks, process equipment, laboratories, the 221-T Canyon, the 221-T Canyon and ventilation systems.

**Process Description:** Between 1964 and 1990, the 221-T Building head-end housed a series of testing programs. From 1964 to 1969 Pacific Northwest Laboratories used the facility to perform experiments with radioactive cobalt, cesium, and iodine. From 1976 to 1985, Westinghouse Hanford Company used the 221-T CSTF to perform liquid metal reactor safety tests using nonradioactive sodium, lithium, and sodium iodide. From 1985 to 1990 the unit was part of the light water reactor tests which were conducted with nonradioactive cesium, manganese, zinc, lithium sulfate, iodine, and hydrogen iodide. The unit was to be used as a research laboratory intended for use as an alkali metal waste treatment unit. It was anticipated alkali operations were to begin in 1977. The unit was also intended to treat dangerous alkali metal waste by heating the waste in a treatment tank equipped with an offgas system.

**Waste Type:** Process Effluent

**Waste Description:** Wastes generated at the laboratory were intended to include alkali metal hydroxide, oxides, and carbonates. The maximum process design capacity for tank treatment was intended to be 100 liters (26.4 gallons) per day. The 221-T never managed dangerous waste. Previous use of the facility included experiments with radiological constituents. Residual contamination may be present.

**Code:** 221-T-5-6  
**Classification:** Accepted

**Names:** 221-T-5-6; 221-T-TK-5-6; T Plant Complex; Tank 5-6 221-T System

**Reclassification:** None

**Type:** Storage Tank

**Start Date:** 1/1/1944

**End Date:**
Active Status: End Date:

Description: Tank 221-T-5-6 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is cylindrical in shape.

Location: The tank is located in cell 5L, in the northern third of the 221-T canyon.

Related Sites/Structures: Structures associated with tank 221-T-5-6 include transfer lines, cell 5L equipment, and the other tanks and sumps in the 221-T tank system.

Process Description: Tank 221-T-5-6 provides additional storage for tank 221-T-5-9. Liquid wastes are transferred to the tank for temporary holding from 221-T-5-9. The liquid wastes are eventually transferred back to 221-T-5-9 and subsequently to 221-T-15-1.

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

---

Code: 221-T-5-7

Names: 221-T-5-7; 221-T-TK-5-7; T Plant Complex; Tank 5-7 221-T System

Type: Storage Tank

Status: Active

Description: Tank 221-T-5-7 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is rectangular with a flat bottom.

Location: The tank is located in cell 5R, in the northern third of the 221-T canyon.

Related Sites/Structures: Structures associated with tank 221-T-5-7 include transfer lines, cell 5R equipment, and the other tanks and sumps in the 221-T tank system.

Process Description: Tank 221-T-5-7 is the receiving point for liquid waste collected in the 610 millimeter (24 inch) liquid collection line which extends the length of the canyon building and receives drainage from all cells (except 5R) and the railroad tunnel. The tank also receives waste from the 211-T collection sump (by way of tank 221-T-6-1 overflow to the cell 6L drain) and drainage from the decontamination pad over cell 15L. Liquid waste are transferred from 221-T-5-7 to 221-T-5-9 via a steam jet. Sump 221-T-5-8 acts as secondary containment for this tank.

Waste Type: Process Effluent

Waste Description: The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

---

Code: 221-T-5-9

Names: 221-T-5-9; 221-T-TK-5-9; T Plant Complex; Tank 5-9 221-T System

Type: Storage Tank

Status: Active

Description: Tank 221-T-5-9 is a type 347 stainless steel tank with piping connecting the unit to other tanks in the 221-T tank system. The tank is cylindrical in shape.
### Tank 221-T-5-9

**Location:** The tank is located in cell 5L, in the northern third of the 221-T canyon.

**Related Sites/Structures:** Structures associated with tank 221-T-5-9 include transfer lines, cell 5L equipment, and the other tanks and sumps in the 221-T tank system.

**Process Description:** Tank 221-T-5-9 receives waste from tank 221-T-5-6 and occasionally from tank 221-T-5-7. Liquid waste is transferred from 221-T-5-9 to 221-T-15-1 via steam jet.

**Waste Type:** Water

**Waste Description:** The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

### Tank 221-T-6-1

**Location:** The tank is located in cell 6L, in the northern third of the 221-T canyon.

**Related Sites/Structures:** Structures associated with tank 221-T-6-1 include transfer lines, cell 6L equipment, and the other tanks and sumps in the 221-T tank system.

**Process Description:** Tank 221-T-6-1 receives waste transferred from the 211-T collection sump. The tank overflows into containment sump 6-L (cell 6L) and gravity drains to tank 221-T-5-7 via the 221-T Building's common 610 millimeter (24 inch) liquid collection line.

**Waste Type:** Sludge

**Waste Description:** The unit receives liquid mixed waste from T Plant (221-T, 2706-T) decontamination operations.

Code: 224-T Classification: Accepted
Names: 224-T; 224-T Canyon; Plutonium Concentration Facility Reclassification: None
Type: Process Unit/Plant Start Date: 1/1/1944
Status: Inactive End Date:        
Description: Access to the building is restricted. The entrance portion of the building is enclosed in a locked, chain link fence. The east side of the building that coincides with the canyon cells has sealed doors marked A, B, C, D, E, and F. Each door is posted with Fissile Material, High Radiation, High Contamination and Airborne Contamination signs. Adjacent to the doors, Fixed Contamination signs are posted on painted portions of the concrete facility walls. Inside the building, the canyon portion of this building has been sealed off and is not accessible. 
Location: This is a three story concrete building located southeast of 221-T and south of 222-T.
Release Description: In 1972, while modifications to the building were being made, plutonium contaminated soil was identified outside the building, presumably associated with a leaking process waste line (UPR-200-W-102).
Related Sites/Structures: This portion of the 224-T building is associated with the Bismuth-Phosphate plutonium processing of nuclear fuel at 221-T from 1944 to 1956. The pipeline from 224-T to 216-T-3 reverse well is sitecode 200-W-226-PL.
Process Description: The building was originally constructed in 1943 as part of the T Plant bismuth-phosphate fuel processing complex. From 1944 to 1956 it functioned as the Plutonium Concentration Facility, concentrating the liquid output from the plutonium separations plant from 1,249 liters to 30 liters. The concentration took place in six radiologically contaminated process cells (Cells A,
B, C, D, E, & F), located in the southeastern 1/3 of the 224-T building. The cells contained various tanks and piping. Cells A, B, D, and E contained a 40 inch centrifuge on a platform. Cell C is a pit that connects to the underground pipe tunnel from Sections 13 & 14 of 221-T. Cell F was "L" shaped and included an office and a glass enclosure where partial finished product was collected for transfer to 231-W. The contaminated process cell equipment was flushed when the process was terminated (1960's). The amount of radiological or regulated material remaining within the process cells and piping is unknown. The plutonium concentration process was identical to the concentration process done at 224-B in 200 East Area. A thorough radiological characterization was done of the 224-B Hot Cells in 1985. An inventory of radioactive material remaining in the 224-B hot cells, based on average measurements, estimated 1.1 curies of cesium-137, 22 curies of strontium-90, 3.7 curies of cobalt-60, 5 curies of americium-241, 31 curies of plutonium-239 and 2 curies of other plutonium isotopes. This characterization is assumed to be similar to what may remain in the 224-T hot cells. The building was used as a plutonium liquid and scrap plutonium storage facility from 1975 to 1985. In 1985 the building was modified to house the Transuranic Assay Facility (TRUSAF) equipment. The TRUSAF Part A Permit states the contaminated canyon portion was sealed off from the rest of the building in 1975. During the 1960's and 1970's, the 224-T building was used to store solid and liquid plutonium-bearing material. The storage area was located on the second floor, in the pipe gallery. The southwest end of the first floor of 224-T consisted of the former G-Cell (never used) and the F-10 Hood Room. This area and the adjoining office was converted into an auxiliary measurement facility, equipped with instrumentation for measuring quantities of plutonium. There was also an enclosed equipment dismantling area that handled equipment for the recovery of plutonium residues. In 1985, a RCRA compliant storage unit Transuranic Waste Storage and Assay Facility was placed in 224-T and occupies 2/3 of the building and adjacent outdoor areas. This portion of the building is documented in WIDS Site code TRUSAF. This operation is currently on standby.

Waste Type: Water

Waste Description: In the 1940's, plutonium solutions were concentrated in the six cells in 224-T. In the 1950's, the tanks were drained and rinsed. In 2001, Non-destructive Assay analysis of nineteen tanks found less than 2 grams of fissile material inside the tanks, except for one that contained 4 grams of fissile material.

Type: Neutralization Tank  Start Date: 1/1/1987
Status: Inactive  End Date: 1/1/1989
Description: The unit was part of a four tank system designed, located inside the 224-U building. The tank neutralized UO3 Plant process condensate prior to disposal in the 216-U-17 Crib. Buildings 224-U, 224-UA and 203-UX were demolished in 2010. The neutralization tank was removed from the 224-U building and disposed in the ERDF landfill. DOE/RL-2011-04 documents the removal action activities.
Location: The tank was located along the north wall of cell C, inside the 224-U Building.
Related Sites/Structures: Structures related to 224-U CNT include Phosphoric Acid Tank TK-C-8, Potassium Hydroxide Tank TK-X-36, Surge Tank TK-X-37, transfer lines, pumps, valves, instrumentation, and the 216-U-17 Crib. The demolished structure is associated with the 200-W-136 stabilized area.
Process Description: The process condensate stream is currently inactive. The 224-U Condensate Neutralization Tank is presently in a standby mode with the Uranium Trioxide (UO3) Facility. During active facility operations, a predetermined dose of phosphoric acid was pumped from TK-C-8 to TK-C-5 every time condensate was pumped from TK-X-37 to TK-C-5. The agitator in TK-C-5 worked in conjunction with a recirculating pump loop to agitate the mixture. Potassium hydroxide from TK-X-36 was added to the recirculating loop under pH feedback control. When pH was within the specified limits, the recirculating loop discharged from the system. Process condensate was discharged to Crib 216-U-17 until 1989. Afterwards it was discharged to storage tanks at the Uranium Trioxide (UO3) Plant.
Waste Type: Not Specified
Waste Description: Under normal operating conditions, the process condensate is not designated as a dangerous waste. However, there is a potential for residual chemical or radiological contamination to be present in this neutralization system.

Code: 224-U HWSA  Classification: Accepted
Type: Storage Pad (<90 day)  Start Date: 1/1/1986
Status: Inactive  End Date: 1/1/1995
Description: The unit consisted of a paved pad surrounded by a paved parking area on the northwest side of the 224-U Building. There is (April 12, 2000) no longer any evidence of the 90 Day Storage Pad in the area.
Location: The site was located on the northwest side of the 224-U Building.
Related Sites/Structures: Structures associated with this unit included the 224-U Building and any containment units located at the pad.
Process Description: The hazardous waste staging area was used to store (stage) Uranium Trioxide (UO3) and PUREX Plant related hazardous wastes prior to transport.
Waste Type: Not Specified
Waste Description: Waste that was stored (staged) here included paints, solvents, and other hazardous wastes generated at the Uranium Trioxide (UO3) Plant.

Code: 276-U  Classification: Accepted

Hanford Site Waste Management Units Report
February 2015  1874
Names: 276-U; 276-U Solvent Facility; 276-U Solvent Handling Facility; 276-U Solvent Recovery Facility
Reclassification: Rejected (6/25/2014)
Type: Process Unit/Plant
Start Date: 1/1/1952
Status: Inactive
End Date: 1/1/1957
Description: This is a DUPLICATE entry. 276-U is also documented as a subsite to 221-U; 221-U:3. The 276-U Solvent Recovery Facility is an aboveground concrete basin extending below grade. The unit is physically attached to the southern wall of the 221-U Canyon.
Location: The unit is directly attached to the southern wall of 221-U.
Related Sites/Structures: Structures associated with the unit include the tanks and vacant tank pads, the 221-U Building, and the numerous access equipment and utilities related to the tanks.
Process Description: The building is currently isolated. Prior to retirement the building was used for the makeup and treatment of the organic solutions used in the 221-U Building.

Code: 296-U-10
Classification: Accepted
Names: 296-U-10; 296-U-10 Stack
Reclassification: Rejected (6/25/2014)
Type: Stack
Start Date: 
End Date: 1/1/1976
Description: The exhaust stack is on the rooftop of the 271-U Building and is supported by the 221-U Building wall. The stack is constructed of carbon steel. It 0.6 meters (24 inches) in diameter and extends 3 meters (10 feet) above the roof. An electric motor and fan enclosure, associated with the stack, are also mounted on the rooftop, and rest on a 3 meter by 2.4 meter (9 foot 10 inch by 8 foot) metal foundation.
Location: The site is located on the roof of the 271-U Building.
Related Sites/Structures: An electric motor and fan enclosure, also mounted on the rooftop and resting on a 3-meter (9.8-foot) by 2.4-meter (8-foot) wide metal foundation are associated to the unit.

Code: 200-W ADS
Classification: Accepted
Names: 200-W ADS; 200-W Ashpit Demolition Site
Reclassification: Closed Out (10/26/1995)
Type: Experiment/Test Site
Start Date: 1/1/1984
End Date: 1/1/1995
Description: The waste site RCRA Treatment, Storage, Disposal unit has been Closed Out. It is no longer marked or posted. Prior to 1995, the site had been marked with a nylon rope and a sign stating RCRA Waste Site - Do Not Disturb.
Location: The site was located inside the 200 West Area, southeast of the 200 West Area Powerhouse, on the east side of Beloit Ave. The activity occurred within the footprint of the 200 West Area Burn Pit. The documented coordinates were verified and place the site inside the open excavation currently known as the 200 West Burn Pit.
Related Sites/Structures: The site is associated with the original 200-W ADB (200 West Area Ash Disposal Basin) footprint and the 200 West Burn Pit.
**Process Description:**
The site was used for thermal treatment of discarded shock-sensitive or potentially explosive chemical wastes. Only two demolition events occurred at this site, one in November 1984 and the other in June 1986. The discarded chemicals were placed into a 0.3 meter (1 foot) hole. Two gallons of unleaded gasoline was added and the discarded chemicals were detonated in their original containers. The shock wave from the explosion and fire would have caused chemical residue to be dispersed over the area.

**Closure Info:**
The TSD unit was Clean Closed in accordance with the Washington Administrative Code (WAC) closure performance standards. The letter of acceptance from the Department of Ecology was received 10/26/1995. Soil samples were collected and analyzed to show the absence of chemicals in the soil.

**Code:** 200-W CSLA  
**Classification:** Accepted

**Names:** 200-W CSLA; Construction Surface Laydown Area; Non-Rad Burial Ground; 200-W Construction Surface Laydown Area  
**Reclassification:** Rejected (1/19/2000)

**Type:** Dumping Area  
**Start Date:** 1/1/1945
**End Date:** 1/1/1950

**Status:** Inactive

**Description:** The site is an old construction laydown area. The laydown area is not marked. The 216-U-17 Crib is located at the northwest corner of this location. A 1997 site visit also noted the 200-UP-1 Groundwater Pump and Treat facility in the northwest portion of this location. There was evidence of scattered miscellaneous debris on the surface of the vacant area south and east of the 216-U-17 crib. In 1997, construction of the new Cross-Site Transfer Line was occurring nearby.

**Location:** The site is located near the southeast corner of the 16th street and Beloit Avenue intersection, inside 200 West Area.

**Related Sites/Structures:**
The area is associated with 200-W-71.

**Process Description:**
A copy of a historical photograph from an unidentified document was found that shows the construction laydown area being actively used. There is a large temporary hut and several smaller temporary structures and material located at the site. It is assumed to have been taken in the early 1950's, when U Plant was being renovated to begin the Uranium Metal Recovery mission. The U-Plant Technical Baseline Report states the area was a "pit" where trucks were driven to dump material. No drawings have been identified that identify a pit at this location, although an open trench is visible on a 1948 aerial photograph, east of where the 216-U-17 crib is currently located. The trench has been given WIDS sitecode 200-W-71. A meeting with HL Maxfield and RP Knight in 1987 prior to the construction of the 216-U-17 Crib confirmed the area had been used as a laydown area to support construction activities at U-Plant. That explained the large amount of surface debris in the area. The debris located over the new crib site was bladed off during construction.

**Code:** 200-W PAP  
**Classification:** Accepted

**Names:** 200-W PAP; 200-W Powerhouse Ash Pit  
**Reclassification:** Rejected (5/21/2008)

**Type:** Coal Ash Pit  
**Start Date:** 1/1/1943
**End Date:** 1/1/1995

**Status:** Inactive

**Description:** The pit is a rectangular, open hole, approximately 7.6 meters (25 feet) deep. In February 2000, the site was empty and dry. As of April, 2000, the unit is a deep pit with steep sloped
sides. It is surrounded with a light chain and posted with "Danger-Open Pit" signs. A layer of ash remains on the floor of the pit.

**Location:** The pit is located south of the 284-W Powerhouse, west of Beloit Ave. and north of 19th Street.

**Related Sites/Structures:** The pit is associated with the 284-W Powerhouse and the 200-W Ash Disposal Basin.

**Process Description:** When supporting the powerhouse operation, the pit was filled with an ash slurry that was sluiced through two underground pipes that emerge from the north side of the pit. Periodically, when the pit became too full, ash was dredged from the pit and moved to the Ash Disposal Basin located on the east side of Beloit Ave.

**Names:**
- 200-W-17; S Plant Project W-087 Aluminum Silicate Discovery

**Type:** Unplanned Release

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** The pipe trench where white aluminum silicate was found has been back-filled to grade. A single, unmarked, steel post indicates the location of the excavation. No signs are attached to the post. There is no visual evidence of aluminum silicate on the surface.

**Location:** The site is located in the 200 West Area, southwest of REDOX. The site is 120 meters (394 feet) north of 10th Street, along the dirt road that runs outside the REDOX exclusion area fenceline.

**Release Description:** On July 17, 1995, while digging a new pipeline (project 200 W-087), a band of white material was found in the trench excavation. A sample was collected and analyzed. The source of the aluminum silicate is likely to be the same as WIDS site 200-W-1 Mud Pit.
### Related Sites/Structures:

Associated structures include 200-W-1 and the 200 W-087 pipe line project.

### Code: 200-W-18

#### Classification:

Accepted

#### Reclassification:

Rejected (5/6/2004)

#### Names:

200-W-18; S Plant Project W-087 Aluminum Oxide Discovery

#### Type:

Unplanned Release

#### Status:

Inactive

#### Description:

The pipe trench where the aluminum oxide was found has been backfilled with soil. A single, unmarked, steel post marks the location of the excavation. There is no visual evidence of aluminum oxide on the surface.

#### Location:

The site is located west of 202-S (REDOX), on the west side of the dirt road running outside the REDOX exclusion area fence.

#### Release Description:

On July 17, 1995, while digging a new pipe trench for Project 200 W-087, a layer of white material was seen in a pipeline excavation. It was found approximately 0.3 meters (one foot) below ground surface and was approximately 3 inches thick. The source of the aluminum oxide at this site is likely the 200-W-1 Mud Pit.

### Code: 200-W-19

#### Classification:

Not Accepted

#### Reclassification:

None

#### Names:

200-W-19; Steam Line Asbestos Release

#### Type:

Unplanned Release

#### Status:

Inactive

#### Description:

The site is not marked or posted. It is under a lawn between the M0039 building and a sidewalk. The site is where asbestos covering a clean steam line was knocked to the ground and cleaned up by the next day.

#### Location:

The release site is located approximately 37 meters (40 yards) west of the 2704S building.

#### Release Description:

On August 30, 1995, a backhoe driver was driving under an aboveground steam line when his backhoe hydraulic arm struck the steam line. An area approximate 2 to 3 feet (0.6 to 0.9 m) in length, along the 10 inch (25 cm) line, was affected. This allowed a release of approximately 1180 cubic centimeters (72 cubic inches) of asbestos to the ground below.

### Code: 200-W-20

#### Classification:

Accepted

#### Reclassification:

None

#### Names:

200-W-20; T Plant Complex

#### Type:

Process Unit/Plant

#### Status:

Active

#### Description:

The T Plant Complex is enclosed within a 2.4 meter (8 foot) chain link fence. Facilities within the fence include the 221-T Canyon Building, the 2706-T Decontamination Facility, the 211-T Sump, the 214-T Storage Building, the 277-T Storage Building, the 2715-T Material Storage Building, the 291-T Ventilation Stack Complex and several small support buildings. The T Plant Complex is considered a RCRA Treatment and Storage Unit.
**Location:** The T Plant Complex is located inside the 200 West Area near the corner of Beloit Ave. and 23rd Street.

**Release Description:** Over time, several documented unplanned releases have occurred within the area now defined as the T Plant Complex. HAN-62372 DEL documents that a valving error released 2350 gallons of phosphoric acid to the ground in the 211-T area in November 1955.

**Process Description:** Currently, the T Plant Complex is a treatment and storage unit for dangerous and mixed waste. The primary mission of the facility is to decontaminate equipment and debris. Equipment is often decontaminated and repaired prior to being returned to service on the Hanford site. Additional activities include identification, verification, sampling, treatment and repackaging of dangerous and mixed waste and decontamination technology demonstrations. Within the T Plant complex, dangerous and/or mixed waste decontamination and treatment activities occur in the 221-T canyon, the 221-T railroad tunnel, the 2706-T building and support facilities incorporating various technologies to remove mixed waste contamination. Liquid waste generated from the decontamination process is collected and transferred to the 2706-T tank system or the 221-T tank system. From these tank systems, the waste is transferred to a treatment, storage/disposal unit capable of accepting this waste. Treatment of dry and liquid waste may include sorting, repackaging, neutralization, absorption and compaction. The 221-T Canyon Building was originally constructed in 1944 to separate plutonium from irradiated fuel rods using the bismuth phosphate process. It continued to be used for that purpose until 1956. It is constructed of reinforced concrete divided into twenty sections, three galleries and a railroad access tunnel. In 1957, T Plant became a decontamination facility. Activities include repair of large equipment and decontamination techniques including high pressure washing, vibratory polishing, acid baths and sand blasting. Some failed equipment is being stored on the canyon deck and in the canyon cells. The 2706-T building is constructed of prefabricated steel. It is used to decontaminate equipment and vehicles. The building contains two pits (the railroad pit and the automotive pit) over which the vehicle decontamination is performed. Liquid mixed waste from 2706-T decontamination activities is stored in the railroad pit sump that has a 23,000 liter (6,100 gallon) capacity. The liquid is transferred via underground piping to the 211-T collection sump and the to the 221-T tank system. The liquid is automatically transferred out of the 211-T sump when a designated level is reached. The 214-T Building is constructed of corrugated steel. It is used to store containerized chemicals and dangerous/mixed waste in segregated areas. The floor is sloped to prevent the mixing of incompatible chemicals. The sloped floors direct spills to separate floor sumps.

*Hanford Site Waste Management Units Report*  
February 2015  
1880
Names: 200-W-24; 216-S-10 Borrow Pit; S-10 Pond Borrow Area
Reclassification: None
Type: Depression/Pit (nonspecific)
Start Date: 1/1/1984
Status: Inactive
End Date:
Description: The site is an unmarked, large, scraped sandy area near the southwest corner of 200 West Area. Its surface is mostly level with the surrounding area, except for a cut-away hill on the west edge of the borrow pit. The site has mostly revegetated with crested wheatgrass.
Location: The borrow area is located immediately south of the 200 West Area, just outside of the perimeter fence.
Related Sites/Structures: The borrow pit is associated with the 216-S-10 Pond.
Process Description: Clean backfill material was taken from this area in 1984 during the 216-S-10 stabilization activities. No waste has been deposited in this area.

Code: 200-W-25
Classification: Not Accepted
Names: 200-W-25; 216-S-16 Borrow Pit
Reclassification: None
Type: Depression/Pit (nonspecific)
Start Date: 1/1/1984
Status: Inactive
End Date:
Description: The site is a shallow, scraped area that forms a semi-circle around the north and west edges of the stabilized 216-S-16 Pond. The site is mostly revegetated with crested wheatgrass and large patches of native plants.
Location: The borrow pit is located southwest of 200 West Area, outside the perimeter fence.
Related Sites/Structures: This borrow pit is associated with the 216-S-16 Pond.
Process Description: Clean backfill material was taken from this area to backfill and stabilize the 216-S-16 Pond. No waste has been placed in this area.

Code: 200-W-26
Classification: Not Accepted
Names: 200-W-26; 216-S-17 Borrow Pit
Reclassification: None
Type: Depression/Pit (nonspecific)
Start Date: 1/1/1984
Status: Inactive
End Date:
Description: The site is an unmarked shallow scraped area located south of the stabilized 216-S-17 Pond. It is slowly revegetating.
Location: The borrow pit is located outside the south perimeter fence of the 200 West Area. It is south of the southern boundary of the stabilized 216-S-17 Pond.
Related Sites/Structures: The borrow pit is associated with the 216-S-17 Pond.
Process Description: Clean backfill material was taken from this area to backfill and stabilize the 216-S-17 Pond. No waste was placed in this area.

</table>
Process Description: Clean backfill material was taken from this area and used to stabilize the surface of the 216-Z-19 Ditch. No waste was placed in the borrow pit.

**Code:** 200-W-34  
**Classification:** Not Accepted

**Names:** 200-W-34; 2607-WL; 272-WA Septic System North of 213W; Duplicate of 2607-WL  
**Reclassification:** None

**Type:** Septic Tank  
**Status:** Inactive

**Description:** This site is a duplicate of 2607-WL, which is also listed in WIDS as servicing the 272-WA Building and being north of that facility.

**Related Sites/Structures:** The 2607-WL septic system services the 272-WA Building. The 200-W-34 septic system was entered into WIDS, but is a duplicate of 2607-WL septic system.

**Code:** 200-W-35  
**Classification:** Accepted

**Names:** 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W  
**Reclassification:** Rejected (5/13/2008)

**Type:** Dumping Area  
**Status:** Inactive

**Description:** During the late 1970's and early 1980's, the area north of 13th Street and west of Albany Ave. was used for testing various technology development studies. A 1995 Site Investigation visually identified a shallow excavated area, a pit covered with plywood, and a vertically buried garbage can with the lid at ground surface level. The sites are no longer visible because they were backfilled in 1997. They are not marked or posted.

**Location:** The sites are located inside the 200 West Area, in an empty field north of 13th Street and west of Albany Avenue. Access is via a dirt road north of the 201-W Fence.

**Related Sites/Structures:** This site is associated with information contained in Subsite section of 200-W-35, 200-W-12 and 200-W-10.

**Process Description:** During the 1970's, the Atlantic Richfield (ARCO) and Rockwell Research Departments used this area for testing equipment and processes to support the waste management operations. This area was selected for testing because it was adjacent to the REDOX facility, where the Research Department offices were located, and because the area did not contain any contaminated facilities or vadose contamination.

**This Site has the Following SubSites:**

**Code:** 200-W-35:1  
**Names:** 200-W-35:1; 200-W-35-A Infiltration Test Site

**Code:** 200-W-35:2  
**Names:** 200-W-35:2; 200-W-35-B; Bentonite Slurry Test Site

**Code:** 200-W-35:3  
**Names:** 200-W-35:3; 200-W-35-C; Buried Garbage Can with Lid

<td>Description:</td>
<td>The Bentonite Slurry Test Site is located on the east side of the dirt road north of 201-W about half way between 201-W and the end of the road. It is a pit covered with a plywood cover and a circular hole cut in the plywood. W.H. Price states the site was used to develop a tool to sample the 361-Z Tank. Three drums were welded together and filled with a thick bentonite slurry and food coloring to simulate the contents of the 361-Z Tank. The test principal investigator (C.T. Webster) stated that no hazardous or radioactive materials were used in the test. This pit was backfilled with clean dirt on June 20, 1997.</td>

The SubSite is Part Of:
Codes: 200-W-35
Names: 200-W-35; 200-W-35-A Infiltration Test Site; 200-W-35-B Bentonite Slurry Test Site; 200-W-35-C Buried Garbage Can with Lid; Lysimeter Test Site; Various Sites North of 201-W

Code: 200-W-36
Classification: Accepted
Reclassification: None
Names: 200-W-36; Above Ground Storage Tank; EP 211-143; TK-SQ-143
Type: Storage Tank
Status: Inactive
Start Date: 1/1/1969
End Date: 
Description: The site is a single aboveground, horizontal tank on three concrete saddles. In April 2014, the tank was posted with "Caution - Radioactive Material - Internally Contaminated" signs that are attached to the sides of the tank.
Location: The tank is in the 211-T tank farm area, which is between 221-T and 2706-T.
Related Sites/Structures: The site is related to 2706-T, 221-T, 211-T Tank Farm.
Process Description: Originally, the tank was a product tank that stored solutions used in reactor fuel dissolving process. After T Plant ceased operation as an active process facility, the tank was used as a storage tank to temporarily hold 2706-T liquid decontamination waste until it could be sampled. The waste was then transferred to tanks in 221-T Building or to another location. The tank has not actively managed wastes since 1969. At that time a pipeline from 211-T Sump to 221-T Building was installed. Ten to eighteen inches of solids remain in the tank.

Code: 200-W-37
Classification: Accepted
Reclassification: Consolidated (6/13/2002)
Names: 200-W-37; Buried Tygon Tubing Near 241-S-101 Dumping Area
Type: Dumping Area
Status: Inactive
Start Date: 
End Date: 
Description: The site is not separately marked or posted.
Location: The site is located just west of the 241-S-101 tank, inside 241-S Tank Farm.
Process Description: In Volume 2 of WHC-EP-0912, JD Anderson documented interviews with former Hanford workers. One of these interviews discusses flushing plugged transfer lines with hot water. The former employee states that in order to unplug one line in 241-S Tank Farm, a piece of heavy tygon tubing was attached to the pressure hose to allow the flush water to negotiate the turns of the transfer line.

This Site Was Consolidated With:
Code: 200-W-96
Names: 200-W-96; Contaminated Soil at 241-S/SX/SY Tank Farm

Code: 200-W-40
Classification: Accepted
Reclassification: Rejected (6/25/2014)
Names: 200-W-40; 292-T; Emission Control Lab; Stack Gas Sampling Building
Type: Laboratory
Status: Inactive
Start Date: 
End Date: 

Hanford Site Waste Management Units Report
February 2015
Description: The waste site is a grey, concrete block building. The back side of the building is surrounded by post and chain labeled "Contamination Area". A sign on building reads "Emission Control Laboratory 292-T". The surrounding area is gravel and cobbled.

This waste site is being Reclassified to Rejected because it does not meet the WIDS database scope, as described in Section 2.0 of TPA-MP-14, Rev. 2.

TPA-MP-14, Rev. 2, Section 2.0 states that WIDS does not document buildings or facilities that do not contain TSD units. It further states that, after buildings are demolished, the footprint will be evaluated for potential soil contamination. If present, the soil contamination will be added to WIDS as a Discovery Site.

Location: The building is located in northeast portion of 200 West Area, within T-Plant Complex. It is about south of 291-T stack, north of 222-T building, and east of 221-T building.

Related Sites/Structures: The site is associated with 291-T, 221-T, 216-T-8, 200-W-140-PL pipeline and the 200-W-16 underground tanks.

Process Description: The 292-T building originally housed the 291-T stack gas sampling system and supported the 221-T off gas monitoring operations. When T plant was built it was not known what material would escape during the reprocessing of the irradiated fuel. Accordingly the stack was equipped with state of the art monitoring equipment, including scrubbers containing 5% soda ash solutions that the stack effluent was passed through. The solution was dried using refrigeration, and then counted to determine Xenon-133 activity. Extensive reviews of documentation remaining from T Plant operations has not located any documents that quantify the amount of material that was placed in the tanks, but very little emphasis was placed on waste management at that time and it is doubtful that any documents were kept. In 1966, a building addition was added to the existing structure to house a fuel element testing facility, operated by Battelle Northwest. During the lab upgrade, the two underground storage tanks were relocated from southeast of the original 292-T building to their present position, southeast of the 292-T building addition. Fuel failure analysis of irradiated fuel rods was conducted in 292-T in the 1960's and early 1970's. Irradiated N Reactor fuel rods were heated in an induction furnace until rupture or failure occurred. After the rupture occurred, the fuel was transported to the 300 area for further analysis. The fragments that remained in the oven were removed, and any material that remained on the oven surface was dissolved with nitric acid. It is doubtful that much if any of the aluminum clad was dissolved, since aluminum will not dissolve in nitric acid without the use of a catalyst. The solution of trace amounts of irradiated fuel and nitric acid was taken to 200 West Area and poured into the 292-T-TK-1 and 2 tanks through the risers. The solution in the tanks was then neutralized with sodium hydroxide. Neutralization caused the dissolved metals to precipitate and deposit in the tank bottoms.

Code: 200-W-41
Names: 200-W-41; Abandoned Drums; Drums Found East of T Plant
Type: Dumping Area
Status: Inactive

Classification: Accepted
Reclassification: Rejected (5/13/2008)
Start Date: 1/1/1999
End Date: 1/1/1999

Description: In August 1996, the site was described as a single 190-liter (50-gallon) carbon tetrachloride drum and two 114-liter (30-gallon) Trysben (herbicide) drums. The drums showed no evidence of contaminating the surrounding soil. A hole was observed near the bottom of the carbon tetrachloride drum. A site investigation done in September 1996 found only two drums at this location. The 114-liter (30-gallon) Trysben weed killer drum was in good condition and was completely sealed. The drums were removed in September 1999.
The site was located in 200 West Area approximately 200 to 300 meters (660 to 980 feet) east of T Plant, between Beloit and Albany Avenues and north of 23rd Street.

**Code:** 200-W-43
**Classification:** Accepted
**Reclassification:** None
**Names:** 200-W-43; 291-S Stack Sand Filter
**Type:** Sand Filter
**Start Date:** 1/1/1952
**Status:** Active
**End Date:**

**Description:** The 291-S Stack Sand Filter is a below grade concrete structure containing seven layers of sand and gravel. The walls and roof are 0.3 meters (1 foot) thick. The roof is visible above grade and is covered with tar and gravel. The sand filter is outside dimensions are 26 by 26 meters (85 by 85 feet) with a depth of 4 meters (12.5 feet).

**Location:** The 291-S Stack Sand Filter is located adjacent to the east end of the 202-S Facility, southwest of the 291-S Stack.

**Related Sites/Structures:** Associated structures include the 291-S-1 Stack and the 291-S Fan House.

**Process Description:** Layers of sand and gravel were used to filter radioactive contaminants out of the ventilation effluent prior to being released through the 291-S Stack.

**Code:** 200-W-46
**Classification:** Accepted
**Reclassification:** Rejected (9/14/2000)
**Names:** 200-W-46; 222-S Laboratory Room 4-E 90-Day Waste Accumulation Area; Satellite Accumulation Area
**Type:** Satellite Accumulation Area
**Start Date:**
**Status:** Active
**End Date:**

**Description:** This site is not a 90 Day Storage Area but is a Satellite Accumulation Area for Room 4E of the 222-S Analytical Laboratory.

**Location:** This SAA is in Room 4E of the 222-S Building.

**Related Sites/Structures:** This site is part of the 222-S Analytical Laboratory.

**Process Description:** Maintenance waste and expired reagents and chemicals are held here.

**Code:** 200-W-47
**Classification:** Accepted
**Reclassification:** Rejected (9/14/2000)
**Names:** 200-W-47; 211-T Storage Pad 90-Day Waste Accumulation Area
**Type:** Storage Pad (<90 day)
**Start Date:**
**Status:** Inactive
**End Date:**

**Description:** The 90 day storage area was removed when the T Plant Complex became a Treatment, Storage, and Disposal (TSD) facility. With the TSD Permit, mixed waste storage for the T Plant Complex was designated to be "a combination of paved and gravel surfaces and is surrounded
by the fencing that encloses the 2706-T Building." An evaluation of the site in April 2000 showed no wastes stored in this area, but signs on the fence indicate that it is occasionally used for waste storage under the TSD Permit.

**Location:** The waste storage area is on the southwest side of the 2706-T Building.

**Related Sites/Structures:** The site is part of the T Plant Complex TSD. Under the permit, mixed waste may be stored in both the 2607-TA Building (the former 200-W-50 site) and the area enclosed by the 2607-T fence (the former 200-W-47).

**Process Description:** The T Plant Complex Part B Application lists the area surrounded by the fencing around 2607-T as a dangerous waste container storage area.

---

**Code:** 200-W-48  
**Classification:** Accepted  
**Names:** 200-W-48; 241-TX 90-Day Waste Accumulation Area  
**Reclassification:** Rejected (9/6/2000)  
**Type:** Storage Pad (<90 day)  
**Start Date:**  
**Status:** Inactive  
**End Date:** 1/1/1993  
**Description:** The 241-TX Tank Farm 90-Day Waste Accumulation Area has been inactive since October 1993, per the 90-day inspection records maintained by Environmental Waste Operations at the 209-E Building. The site was a self-contained conex box with a spill berm.  
**Location:** The 90-day pad was located approximately 23 meters (75 feet) west of the 241-TX Tank Farm in a fenced area.

---

**Code:** 200-W-49  
**Classification:** Accepted  
**Names:** 200-W-49; 222-S Laboratory Room 2-D 90-Day Waste Accumulation Area  
**Reclassification:** Rejected (9/14/2000)  
**Type:** Storage Pad (<90 day)  
**Start Date:**  
**Status:** Active  
**End Date:**  
**Description:** The storage pad is located in Room 2D of the 222-S Analytical Laboratory, and holds solid and liquid mixed waste from laboratory sample analysis activities.  
**Location:** The storage pad is in room 2D of the 222-S Laboratory.  
**Related Sites/Structures:** The storage pad is related to the 222-S Analytical Laboratory.  
**Process Description:** The pad holds solid and liquid mixed waste from laboratory sample analysis activities.
and Disposal (TSD) facility. With the TSD Permit, mixed waste storage for the T Plant Complex was designated to be "a combination of paved and gravel surfaces and is surrounded by the fencing that encloses the 2706-T Building." An evaluation of the site in April 2000 showed no wastes stored in this area, but signs on the fence indicate that it is occasionally used for waste storage under the TSD Permit.

**Location:**
The waste storage area is adjacent to the west end of the 2706-T Building.

**Related Sites/Structures:**
The site is part of the T Plant Complex TSD. Under the permit, mixed waste may be stored in both the 2607-TA Building (the former 200-W-50 site) and the area enclosed by the 2607-T fence (the former 200-W-47).

**Process Description:**
The 2706-T Building is used to decontaminate railroad equipment, buses, trucks, automobiles, road building equipment, and process equipment.

</tbody>
</table>

**Description:**
An area of debris was identified during a 1997 RCRA Permit General Inspection tour. The site consists of a pile of dirt approximately 10 feet in diameter containing wire, fencing material, metal scrap, cable and grounding rods. The site is not marked or radiologically posted.

**Location:**
The site is located approximately 150 yards north of 221-U.

**Location:**
The laydown area was located outside of the fenced T-Hopper Storage Area, on the west side of the 2714-U Building.

**Related Sites/Structures:**
The site was adjacent to the 2714-U storage facility building (sitecode 200-W-104).
Description: The brine pit is no longer visible. It was demolished into itself and backfilled with gravel in 1999. It is not marked or posted. The two salt dissolving pits each had inner dimensions of 4.3 meters (14 feet) long by 2.4 meters (8 feet) wide by 2.8 meters (9.25 feet) tall. They had a design high water line 2.4 meters (7.75 feet) from the pit bottom. An overflow slot connecting the two dissolving pits was located 0.3 meters (1 foot) above the high water line. The bottom of each pit was filled with a 12.7 centimeter (5 inch layer) of 1.3 to 2.6 centimeter (1/2 to 1 inch) gravel topped by a 17.8 centimeter (7 inch) layer of 0.3 to 0.6 centimeter (1/8 to 1/4 inch) gravel. The dissolving pits each had a 2.4 meter (8 foot) by 0.9 meter (3 feet) opening at the top for receiving salt. Each pit has a capacity of 23,600 kilograms (52,000 pounds) of salt. The brine pump pit was located adjacent to the two salt dissolving pits. The pit was 3.3 meters (10.67 feet) long by 2.2 meters (7.33 feet) wide by 2.1 meters (7 feet) deep. It held two pumps and associated piping (all brass) for the brine system. The floor of the pump pit sloped toward a 46 by 46 by 46 centimeter (18 by 18 by 18 inch) sump in a corner.

Location: The brine pit was located southwest of the 284-W Powerhouse.

Related Sites/Structures: The site is associated with the 284-W Powerhouse.

Process Description: The salt dissolving pits and brine pump pit were part of a single below-grade concrete structure that provided brine for the 284-W Powerhouse. The brine was used to regenerate the ion exchange demineralizers that were part of the powerhouse water treatment system. The brine was created by adding water to the salt in the dissolving pit. As the water passed through the salt, the solution became saturated. The brine passed through the layers of gravel which filtered out salt crystals and other particles. The filtered brine was then drawn off by a pipe connecting to the adjacent brine pump pit. A float valve was used to maintain the water/brine level.
### Site Information

**Names:** 200-W-62; 200 West Powerhouse Coal Pile

**Reclassification:** Rejected (6/18/2008)

**Type:** Depression/Pit (nonspecific)

**Start Date:**

**Status:** Inactive

**End Date:** 1/1/1995

**Description:** The ground surface is covered with remnants of coal. Very little vegetation is growing, only small tumbleweeds. The north side is bordered by a concrete wall. Near the wall is a wooden structure, about 4 meters (12 feet) square and 15 centimeters (6 inches) high, covering the hole used to feed coal to the conveyor belt.

**Location:** The pile was located west of the powerhouse and south of the coal ramp conveyor belt.

**Related Sites/Structures:** The site is associated with the 284-W Powerhouse.

**Process Description:** Large piles of coal had been stored in this area to fuel the 284-W Powerhouse. The powerhouse was shut down in 1995. Most of the coal pile has been removed.

---

### Site Information

**Names:** 200-W-65; Abandoned Water System Pump Vault; Concrete Vault Northwest of WRAP; Water Pumping Station Vault

**Reclassification:** None

**Type:** Control Structure

**Start Date:**

**Status:** Inactive

**End Date:**

**Classification:** Not Accepted

**Description:** The structure is in the undeveloped land in the northwest corner of the 200 West Area. It is a concrete box measuring approximately 3 meters (10 feet) by 3 meters (10 feet) with a smaller concrete curbed structure rising from the center. There are two pipe penetrations and a drain in the floor of the box. A steel grate covers the top. There is an electrical conduit penetrating the wall of the structure and a concrete pump pad. It appears to be an old, abandoned water pumping station for irrigation or dust control.

**Location:** The site is located in the northwest corner of 200 West Area, approximately 0.46 kilometers (0.75 miles) northwest of the WRAP facility. It is adjacent to a gravel road (jeep trail).

**Process Description:** The structure appears to be part of a Pre-Hanford irrigation system or part of an early Hanford construction dust control system.

---

### Site Information

**Names:** 200-W-66; Oil Spill at JCI Annex Feeding 283-W/262-WC

**Reclassification:** None

**Type:** Unplanned Release

**Start Date:** 12/26/1998

**Status:** Inactive

**End Date:** 12/29/1998

**Classification:** Not Accepted

**Description:** The contaminated soil was removed and the site has been backfilled to grade level with crushed gravel on 12/29/98. No visual evidence of diesel stained soil and no diesel fumes were observed a few days later, during an inspection on 1/4/99.

**Location:** The site is located between the 283W and the 284W buildings, just north of 20th street. The 283BA boiler annex fuel tank is located just north of the site.
**Release Description:** Diesel fuel is delivered to JCI 200 east and west boiler annexes by RH Smith Distributing. While delivering fuel to the 283W annex a faulty cam-lock on the dispensing hose at the tank trailer caused fuel to spill on the ground. The RH Smith delivery driver initially estimated the spill to be 3-5 gallons. Notification was made to RH Smith's main office as well as JCI's Operations Supervisor, Mr. Tim Cook. With the initial estimate being less than the required reporting quantity of 10 gallons, no further notifications were made. JCI Operations Supervisor and RH Smith management instructed personnel to apply absorbent to collect and dispose of spilled fuel. This initial estimate of the amount of fuel spilled proved misleading due to the snow and ice present on the ground. Over the weekend of 12/26/1998, a warming trend resulted in the snow and ice to dissipate. On Monday 12/28/1998 a JCI Operator identified diesel fuel still being present. The JCI Operator contacted Mr. Cook who then reappraised the situation. Through this re-evaluation it was determined that approximately 30 gallons of diesel fuel spilled onto the ground, from the base of the annex fuel tank approximately ten feet southward. The entire area of the spill is located on JCI leased property.

**Related Sites/Structures:** The spill is related to the 283W-BA boiler annex fuel tank. The tank is periodically filled via tanker truck.

<tr>
<td>Dumping Area</td>
<td>Inactive</td>
<td>The site is a small area, measuring 4.6 by 3 meters (15 by 10 feet), that contains rusted electrical equipment. The material includes conduit, a light reflector, a space heater, a vent pipe, a little broken glass, and some pieces of charcoal. None of the equipment would have held liquids such as cooling oils or PCBs. One rock appears to have been fire cracked, but there is no discoloration of the soil. The vegetation at the site matches the surrounding area.</td>

<tr>
<td>Laboratory</td>
<td>Active</td>
<td>The 222-S Laboratory Complex is made up of the following components, several of which have separate WIDS entries (such as the components of the Treatment, Storage, and Disposal (TSD) facility):</td>
</tr>
</tbody>
</table>

- The 222-S Analytical Laboratory
- The 222-S Dangerous and Mixed Waste Storage Area (DMWSA), a storage unit
- The 219-S Waste Handling Facility, which contains the 219-S-101, 102, 103, and 104 storage tanks,
- The 222-SA Standards Laboratory,
- The 296-S-21 (active), 219-S-16 (active), 296-S-23 (active), and 296-S-13 (inactive) Stacks.

The 222-S Complex buildings were constructed in 1950 and 1951 to provide analytical chemistry services for the Reduction-Oxidation (REDOX) Plant. Currently, the 222-S Complex
supports a large array of facilities and programs on the Hanford Site with analytical chemistry services.

The 222-S Laboratory is a two-story building in the southeast corner of the 200 West Area. The first floor is divided into three general areas. The west end holds the lunchroom, offices, and locker rooms, which are maintained free of radioactive and dangerous materials. The central section contains laboratories and service areas for work with radioactive and/or dangerous materials. Off the north side of the central section, on the outside of the building, is the 222-S Dangerous and Mixed Waste Storage Area. The east end, also called the multi-curie section, contains laboratories, hot cells, and service areas for work with radioactive samples. All first floor sinks, hood drains, drinking water fountains, equipment cooling water, and steam condensate from radioactive areas drain to the 207-SL Retention Basin. The basins are a non-radioactive, non-hazardous facility. Mixed waste effluents drain to the 219-S Waste Handling Facility.

The second floor of the 222-S Laboratory contains the ventilation supply fans, supply and exhaust ductwork, ventilation system operation and control room, and storage areas. All floor drains, steam condensate overflow drains and the demineralized water system drains empty into the 207-SL Retention Basins.

The 222-S basement contains service piping, vacuum pumps, the counting room areas, an instrument maintenance shop, and a scanning electron microscope. Effluents from the cold tunnel sumps are discharged to the 207-SL Retention Basins and effluents from the hot tunnel sumps discharge to the 219-S Waste Handling Facility.

The supply water for the 222-S Laboratory consists of raw and sanitary water and steam. The raw water is primarily used in the first floor fire sprinkler system, and is less than 1 percent of the waste streams that discharge to the 207-SL Retention Basins. Sanitary water is used for all the other fire sprinkler systems, lab sinks, and hot cells. The sanitary water is estimated to contribute about 85 percent of the waste stream to the 207-SL Retention Basins, and steam condensate is the remaining approximately 15 percent.

The 222-S Dangerous and Mixed Waste Storage Area is part of the 222-S Laboratory Complex TSD, number TS-2-I, and WIDS site code 222-SD. It is located on the north side of the 222-S Laboratory building. Also part of the TSD are Room 2B (site 200-W-76), Room 4E, and the 219-S Storage Tanks (WIDS codes 219-S-101, 219-S-102, and 219-S-103, which includes tank 104).

The 219-S Waste Handling Facility, off the northeast side of the 222-S Laboratory Building, receives liquid mixed waste through hot disposal sinks in the 222-S Laboratory. The waste flows from sink and hot cell drains through all-welded, corrosion-resistant piping to corrosion-resistant tanks located in a below-ground concrete vault in the 219-S facility. The underground portions of the piping are double-encased stainless steel with leak detection to ensure containment and notification if a leak should occur. Pipe connections to the tanks are above maximum liquid levels to avoid potential leaks. The area above the vault is covered with a permanent enclosure and the operating gallery, located north of the vault, contains instrumentation and controls. Adjacent to the operating gallery is the sample gallery which contains a hood that is used for sample analysis during waste transfers. Wastes sent to tanks 101 and 104 are transferred to tank 102, which is a transfer point to the appropriate storage tank in the Double-Shell Tank System. After treatment in tank 102, the waste is transferred through a double encased fiberglass line to Tank Farms via the 244-S Double Contained Receiver Tank (DCRT). Overflows from tanks 101 and 102 are collected in sump 7; overflows from tank 104 are collected in sump 9; intrusion liquids in Cell B are collected in sump 6; and leaks in the Operating Gallery are collected in sump 8.
The 222-SA Standards Laboratory is a five-wide trailer southeast of the 222-S Laboratory. The 222-SA Standards Laboratory prepares non-radioactive standards for the 222-S Laboratory and other analytical laboratories and is also used for non-radioactive development work. Packaged waste generated from the 222-SA Standards Laboratory is non-radioactive, non-dangerous waste, and is accumulated in satellite areas before shipment to the Central Waste Complex. Laboratory sink drains in 222-SA are transferred to the 207-SL Retention Basins.

The 296-S-21 and 296-S-16 Stacks handle both radioactive and non-radioactive emissions. The 296-S-21 Stack exhausts emissions from the 222-S Laboratory after passing through HEPA filtration. The 296-S-16 Stack exhausts emissions from tanks 101, 102, and 104 in the 219-S Waste Handling Facility after passing through a de-entrainment filter and HEPA filter. Both the 296-S-21 and 296-S-16 stacks are record sampled for periodic confirmatory measurements. The 296-S-23 stack exhausts emissions from the 219-S Sample Gallery Hood. It is operated intermittently during waste transfers and the periodic confirmatory measurement consists of a bi-annual non-destructive assay (NDA) of the HEPA filter.

Location: The 222-S Laboratory Complex is on the north side of 10th Street, west of Beloit Ave, in the 200 West Area. The laboratory complex is south of REDOX.

Process Description: The 222-S Laboratory was originally built to support the REDOX plutonium separation process operation in the 202-S facility. After the REDOX process shut down, the laboratory continued to support other Hanford project analyses.

## Code: 200-W-70
### Classification: Accepted
### Reclassification: Rejected (5/31/2001)

### Names:
- 200-W-70; 2731 Burning Pit; Old Burn Pit
- Southeast of Z Plant; 200 West Original Burn Pit

### Type: Burn Pit
### Start Date: 1/1/1944
### End Date: 1/1/1949

### Status: Inactive

### Description:
The site is no longer visible, marked, or posted. It can be seen in an aerial photo from 1948, and Hanford drawing H-2-10011. Its is just outside the current Z Plant fenced area. The location is a flat, graveled parking area, containing the tile field for septic system 2607-WB. In 2012, a new potential asbestos in soil site (200-W-247) was identified and posted with chain. Part of 200-W-247 is located on the previous burn pit.

### Location:
The burn pit was located southeast of the 231-Z Facility. It is just outside the Z Plant fenced area, east of 234-5Z. A portion of the 216-Z-1 Ditch is adjacent to this burn pit.

### Related Sites/Structures:
- In 2012, a Potential Asbestos in soil site was posted near 200-W-70. The new WIDS site is 200-W-247.
**Process Description:** The open pit was used by the construction forces for burning non-contaminated scrap lumber and miscellaneous debris.

### Code: 200-W-72

**Classification:** Not Accepted

**Reclassification:** None

**Names:** 200-W-72; 200-ZP-1 Pump and Treat Unplanned Release

**Type:** Unplanned Release

**Start Date:** 1/1/2000

**Status:** Inactive

**End Date:**

**Description:** There is no visual evidence of the release. Most of the water released was contained within the building, but some leaked into the electrical vaults. The release was determined to be below CERCLA Reportable limits.

**Location:** The 200-ZP-1 Pump and Treat system equipment is located northwest of the 231-Z Building in the 200 West Area.

**Release Description:** On April 13, 2000, a line break at the 200-ZP-1 Pump and Treat system facility caused approximately 87,400 liters (23,000 gallons) of contaminated water to spill inside the building. Most of the water was contained within the building, but some leaked into the electrical vaults. The water was recovered with pumps and transported to Modu-tanks. The CERCLA Reportable quantity for this contaminant is 10 pounds. Only 3.5 parts per million or 0.7 pounds of carbon tetrachloride was calculated to be in the 23,000 gallons of water. Therefore, this was a non-reportable incident.

**Process Description:** The 200-ZP-1 Pump and Treat system is used to pump groundwater that is contaminated with carbon tetrachloride and treat it before returning it to the ground.

### Code: 200-W-74

**Classification:** Not Accepted

**Reclassification:** None

**Names:** 200-W-74; 90 Day Storage Area East Side of 622 F

**Type:** Storage Pad (<90 day)

**Start Date:** 1/1/2000

**Status:** Inactive

**End Date:** 1/1/2000

**Description:** This is a duplicate of site 600-267; the site number was used in error. The pad, inside a metal shed, has been closed.

**Location:** The site was located on the east side of the 622 F Building (Weather Station).

**Related Sites/Structures:** Site 600-267 is the correct side code for this closed 90 Day Accumulation Area.

### Code: 200-W-76

**Classification:** Accepted

**Reclassification:** None

**Names:** 200-W-76; Room 2B 222-S Laboratory TSD

**Type:** Storage

**Start Date:** 1/1/1951

**Status:** Active

**End Date:**

**Description:** The north end of Room 2B in the 222-S Laboratory is partitioned off as a Treatment, Storage, and Disposal (TSD) area using a locked accordion style gate to prevent unauthorized access.

**Location:** The site is located inside the 222-S Laboratory facility.
Process Description: The Room 2B TSD provides container storage of solid and liquid mixed waste until the waste can be transferred to another TSD unit. Hood 16, within Room 2B, is the introduction point for transfer of liquid mixed waste from containers to the 219-S Waste Handling Facility. Mixed waste exceeding personnel protection radiological levels during transfer are introduced into the 219-S Waste Handling Facility via drains in hot cells instead of Hood 16.

Related Sites/Structures: Room 2B is part of the 222-S Laboratory TSD, which also includes the 219-S Tanks, which are WIDS sites 219-S-101, 219-S-102, and 219-S-103 (site 219-S-103 includes both tanks 103 and 104) and the 222-S Dangerous and Mixed Waste Storage Area, which is WIDS site 222-SD.

Code: 200-W-91
Names: 200-W-91; Underground Radioactive Material Area Adjacent to the North Side of 241-U Tank Farm
Type: Unplanned Release
Status: Inactive
Description: The site is a large, irregular shaped area. The area has been covered with clean gravel and posted with Underground Radioactive Material signs. The 2607-WUT sanitary tile field is located adjacent to the western edge of this stabilized zone. The area was surveyed with GPS in 2009. The size and shape of the posted area is larger than the area reported in 1995. The waste site was consolidated into 200-W-95.
Location: The site is located adjacent to the north fenceline of 241-U Tank Farm, west of Camden Avenue.
Release Description: The routine tank farm perimeter surveys were used to trace the radiological history of the contamination on the northeast corner of 241-U Tank Farm. Specks of contamination were documented on the May 1983 and May 1984 surveys, with contamination levels ranging from 500 to 20,000 counts per minute. In September 1986, the area was surrounded with radiation rope and posted with Surface Contamination Area signs. The Surface Contamination Area is documented on subsequent surveys through November 1994. On the May 1995 survey, the area is documented as an Underground Radioactive Material area.
Related Sites/Structures: The site is associated with the 241-U Tank Farm and has been Consolidated with the 241-U Tank Farm contaminated soil sitecode 200-W-95.
Waste Type: Soil
Waste Description:

This Site Was Consolidated With:
Code: 200-W-95
Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: 200-W-103
Names: 200-W-103; 201-W Concrete Silo
Type: Experiment/Test Site
Status: Inactive
Classification: Not Accepted
Reclassification: None
Start Date: None
End Date: None
Description: The structure is a concrete silo. The silo is marked with painted lines, dividing it into rows and sections. The rows are labeled A, B, C, D, and E. The sections are labeled 1 through 10. Electronic sensing devices are embedded into some of the concrete sections. A white, cylindrical liner is standing next to the silo.

Location: The site is located in 200 West Area, on the north side of 13th Street near Albany Ave. It is inside the 201-W facility fence.

Process Description: The silo was constructed as a feasibility test for aboveground, dry waste storage. No waste was ever stored at this site. The test was observing the durability of the concrete silo and the steel liner as it was exposed to the elements over time. The silo has been abandoned. The electronic sensors embedded into the concrete are no longer functioning.

Waste Type: Process Effluent
Waste Description: This was a test facility that did not receive any waste.

---

Code: 200-W-104
Names: 200-W-104; 2714-U Building; 2714-U Foundation; UO3 Storage Warehouse
Type: Foundation
Status: Inactive
Description: The site was a metal building. The building had been posted with Contamination Area, Radioactive Material Area signs. The 2714-U and 275-UR buildings were demolished in 2005. The 2714-U foundation is posted with Underground Radioactive Material signs. (see sitecode 200-W-87)
Location: The building was located northwest of the 221-U canyon facility.
Process Description: The 2714-U Storage Facility had been used to store material related to the Uranium Trioxide operations occurring in 224-U and some items for the Plutonium Finishing Plant. Before being demolished, the main incoming power lines were disconnected at the building. The doors were locked and bird netting was placed at the entrance's on both sides of the building for pest control.
Waste Type: Chemicals
Waste Description: The building had been used to store contaminated equipment related to the Uranium Trioxide operation. Two water shield doors (water drained) were also being stored for the Plutonium Finishing Plant facility along with some miscellaneous metal piping.
Waste Type: Chemicals
Waste Description: After the building was demolished in 2005, the foundation was posted with Underground Radioactive Material signs.

---

Code: 200-W-112
Names: 200-W-112; Miscellaneous Stream #52; Steam Condensate
Type: Injection/Reverse Well
Status: Inactive
Description: The 2714-U Storage Facility had been used to store material related to the Uranium Trioxide operations occurring in 224-U and some items for the Plutonium Finishing Plant. Before being demolished, the main incoming power lines were disconnected at the building. The doors were locked and bird netting was placed at the entrance's on both sides of the building for pest control.
Location: The building was located northwest of the 221-U canyon facility.
Process Description: The 2714-U Storage Facility had been used to store material related to the Uranium Trioxide operations occurring in 224-U and some items for the Plutonium Finishing Plant. Before being demolished, the main incoming power lines were disconnected at the building. The doors were locked and bird netting was placed at the entrance's on both sides of the building for pest control.
Waste Type: Chemicals
Waste Description: The building had been used to store contaminated equipment related to the Uranium Trioxide operation. Two water shield doors (water drained) were also being stored for the Plutonium Finishing Plant facility along with some miscellaneous metal piping.
Waste Type: Chemicals
Waste Description: After the building was demolished in 2005, the foundation was posted with Underground Radioactive Material signs.
**Description:** The site is a 0.9 meter (3 foot) diameter, below ground, cement drain structure. An overhead, insulated pipe enters the top of the drain structure. The drain is currently located within a posted radiological Contamination Area.

**Location:** The drain is located approximately 1.8 meters (6 feet) south of the southwest corner of the 224-U building.

**Related Sites/Structures:** The site is associated with the 224-U facility.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Waste Type:** Chemicals

**Waste Description:** The drain received non-contaminated steam condensate from the 224-U facility. The steam source has been abandoned.

---

**Code:** 200-W-113

**Classification:** Accepted

**Names:** 200-W-113; Miscellaneous Stream #54; North Steam Pit

**Reclassification:** None

**Type:** Injection/Reverse Well

**Start Date:**

**Status:** Inactive

**End Date:** 1/1/1995

**Description:** The drain structure is covered with a yellow metal lid. The lid is labeled with "North Steam Pit" and "Confined Space" signs. The site is surrounded with metal posts and chain.

**Location:** The drain is located approximately 4.5 meters (15 feet) from the northwest corner of the 224-U building.

**Related Sites/Structures:** The site is associated with the 224-U building.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Waste Type:** Steam Condensate

**Waste Description:** The site received non-contaminated steam condensate. The steam source has been eliminated.

Status: Inactive

Description: The site is a 5.08 centimeter (2 inch) pipe and three 2.54 centimeter (1 inch) diameter pipes extending into a broken, 1.2 meter (4 foot) diameter cement french drain structure. The pipe is labeled as MSS-003.

Location: The drain is located northeast of the 221-U Building and is northeast of the 241-WR Vault.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. This was a seasonal discharge.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate.

---

Code: 200-W-116

Names: 200-W-116; Miscellaneous Stream #139; Steam Condensate MSS-TRP-004

Type: Injection/Reverse Well

Status: Inactive

Description: The site is a 0.025 meter (one inch) pipe that emptied into a 1.2 meter (4 foot) deteriorated cement drain. Tags on the steamline identified it as Steam Trap 004.

Location: The drain is located adjacent to Beloit Ave. and 16th Street, east of the north end of 221-U.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. This was a seasonal discharge.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate.

---

Code: 200-W-117

Names: 200-W-117; Miscellaneous Stream #140; Steam Condensate MSS-TRP-005

Type: Injection/Reverse Well

Status: Inactive

Description: The site is a 0.025 meter (one inch) diameter pipe extending diagonally into a 1.2 meter (4 foot) diameter cement french drain structure.

Location: The drain is located adjacent to Beloit Ave. and 16th Street, south of the 291-U Stack.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. This was a seasonal discharge.

Waste Type: Steam Condensate

Waste Description: The drain received non-contaminated steam condensate.

Code: 200-W-119 Classification: Accepted
Names: 200-W-119; Miscellaneous Stream #142; Steam Trap 007 Reclassification: None
Type: Injection/Reverse Well Start Date:
Status: Inactive End Date: 1/1/1998
Description: The site includes a 0.76 meter (2.5 foot) diameter cement drain structure. The overhead steam line has multiple pipes and flanges extending from the bottom of the steam line. A label is attached to the flange, stating it is Miscellaneous Steam Trap MSS-TRP-007. One section has been cut and hangs above a drain structure. Another section of insulated pipe runs northward from the flange and has a 2.5 centimeter (1 inch) diameter pipe extending to a hole in the ground, approximately 2 feet north of the cement drain structure.

Location: The site is located inside the 224-U facility fence, in the southeast corner of the fenced area. It is approximately 1.8 meters (6 feet) north of 16th Street.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Stormwater Runoff

Waste Description: The site received non-contaminated steam condensate. The source has been abandoned.

Reclassification: None
Start Date: 
End Date: 

Description: The site is a 0.025 meter (one inch) diameter pipe extending diagonally into a 0.762 meter (30 inch) diameter cement french drain structure. The drain is filled with rock and dirt. The steam trap is labeled MSS-TRP-009.

Location: The site is located south of 16th Street, southwest of the 221-U building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Stormwater Runoff

Waste Description: The drain received non-contaminated steam condensate.

Code: 200-W-122
Names: 200-W-122; Miscellaneous Steam Trap 014; Miscellaneous Stream #145
Type: Injection/Reverse Well
Status: Inactive
Classification: Accepted
Reclassification: None
Start Date: 1/1/1998
End Date: 1/1/1998

Description: An overhead steam line crosses the railroad track leading to the REDOX facility. It was constructed approximately 20 feet above the track. A scaffold has been constructed at the steam trap location. A tag identifies this location as MSS-TRP-014. A 0.76 meter (2.5 foot) diameter, vitrified clay pipe drain structure is located below the steam line. A 2.54 centimeter (one inch) diameter pipe extends from the overhead steam line to the vitrified clay pipe french drain structure.

Location: The site is located south of 16th Street, southwest of the 221-U building. It is located adjacent to the railroad track that leads to the REDOX facility.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Waste Type: Steam Condensate

Waste Description: The site received non-contaminated steam condensate.

---

**Code:** 200-W-123  
**Classification:** Not Accepted  
**Names:** 200-W-123; Gravel Pit 35  
**Reclassification:** None  
**Type:** Depression/Pit (nonspecific)  
**Start Date:**  
**End Date:**  
**Description:** The site is a large area of shallow excavations.  
**Location:** The site is located south of 23rd Street and east of Dayton Ave. It is west of the 218-W-4A Burial Ground.  
**Process Description:** The site is used to provide clean backfill material for small excavations.

---

**Waste Type:** Steam Condensate

**Waste Description:** The site is a source of clean backfill material. No waste is stored or deposited at this site.

---

**Code:** 200-W-124  
**Classification:** Not Accepted  
**Names:** 200-W-124; PFP Stormwater Pond; Z-9 Pond  
**Reclassification:** None  
**Type:** Pond  
**Start Date:**  
**End Date:**  
**Description:** The pond is no longer visible. The site is not marked or posted.  
**Location:** The pond was located at the end of a corrugated metal pipe, north and east of the 216-Z-9 crib.  
**Process Description:** Overflow effluent from the elevated water tank, inside the Z Plant fence, was connected to a 12 inch corrugated water line. Some stormwater drainage may have also contributed to the effluent. The pond developed at the terminus of the water line during the 1960's. The pond is visible in historical 200 West photographs dated 1963 and 1969. A drawing, dated 1971, states the 12 inch corrugated line is abandoned. The pond dried up after the line was blanked off. The effluent was originally rerouted to the 216-Z-11 ditch and later routed to the 216-Z-21 basin.

**Waste Type:** Chemicals

**Waste Description:** The pond area received stormwater and water tank overflow effluent.

</table>
Plant Dry Wells

Type: French Drain
Status: Inactive
Description: Multiple (more than twenty) concrete dry wells were found in an undeveloped area south of U Plant on the west side of Beloit Ave. The open concrete wells ranged in size from 91.4 centimeters (36 inches) to 106.6 centimeters (42 inches) in diameter. The estimated depths are greater than 1.8 meters (6 feet).
Location: The wells are located south of 16th Street, west of Beloit Ave and southeast of 224-U.
Process Description: A few aerial photographs from the early 1950's indicate a group of temporary construction facilities were located in this area. They apparently were connected to raw water and potable water utilities. They may also have had a buried steam distribution system. Drawings H-2-43235, dated 1951, and H-2-1496, dated 1952 show the plan and profile for the 200 West Area steam distribution system. The drawings indicate a steam connection to temporary construction facilities southeast of U Plant. A 2006 field inspection found one caisson that was open and empty enough to reveal several small diameter pipelines entering the concrete caisson wall approximately 1.2 meters (4 feet) below the ground surface. This supports the concept that they were part of an underground infrastructure system. More open wells were identified in 2010.

Waste Type: Stormwater Runoff
Waste Description: Drawings H-2-43235, dated 1951, and H-2-1496, dated 1952 show the plan and profile for the 200 West Area steam distribution system. The drawings indicate a steam connection to temporary construction facilities southeast of U Plant.

Code: 200-W-147-PL
Names: 200-W-147-PL; Pipeline from 207-SL to 216-S-19 Pond
Type: Radioactive Process Sewer
Status: Inactive
Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-W-147-PL-A and 200-W-147-PL-B). The site is an underground 20 centimeter (8 inch) diameter vitrified clay pipe, extending from the 207-SL retention basin to the 216-S-19 pond.
Location: This portion of the pipeline extends from the 207-SL basin to the Outer Area boundary. The majority of the original pipeline site is located south of the 200 West Area fence.
Related Sites/Structures: The pipeline is associated with the 216-S-19 Pond, 200-W-147-PL-A and 200-W-147-PL-B.
Process Description: The pipeline carried waste from the 222-S and 202-S facilities to the 216-S-19 Pond via the 207-SL Retention Basin.

Code: 200-W-155-PL
Names: 200-W-155-PL; Pipeline from 2904-S-160 Control Structure to 216-S-16 Ditch
Type: Radioactive Process Sewer
Classification: Accepted
Reclassification: Rejected (10/19/2010)
Start Date: 1/1/1952
End Date: 1/1/1984

---

Hanford Site Waste Management Units Report
February 2015
Description: Due to the restructuring of Operable Units, as described in the Tentative Agreement for Central Plateau Cleanup, this pipeline has been split into segments (see 200-W-155-PL-A and 200-W-155-PL-B). The waste site is an underground 61 centimeter (24 inch) diameter vitrified clay pipe. It extends from the 2904-S-160 Control Structure to the head end of the 216-S-16 Ditch.

Location: The pipeline is located outside the 200 West Area perimeter fence, southwest of the 207-S Retention Basin.

Related Sites/Structures: The site is associated with the REDOX cooling water effluent stream, the 2904-S-160 Control Structure, the 216-S-16 Ditch and Pond and the 216-S-6 crib.

Process Description: In 1954, the original 61 centimeter (24 inch) process sewer line (sitecode 200-W-152-PL) was plugged and the flow to the 216-S-17 Pond was abandoned. The effluent was directed to the 216-S-6 crib and later to the 216-S-16 Pond via the 2904-S-160 Control Structure. Flow could be directed to 216-S-6 crib at Manhole 8 via pipeline 200-W-156-PL.

Code: 200-W-189-PL

Names: 200-W-189-PL; Lines SNL-5350 and SNL-5351; Transfer Lines from 219-S to 241-SY Tank Farm

Type: Direct Buried Tank Farm Pipeline

Status: Active

Description: The waste site is two underground, 5 centimeter (2 inch) diameter fiberglass pipelines. Each line is double contained inside a 10 centimeter (4 inch) pipe.

Location: The pipeline extends between 219-S, located southeast of REDOX, and the 241-SY Tank Farm.

Related Sites/Structures: The pipeline is associated with the 219-S building and tanks 241-SY-101 and 241-SY-103 in the 241-SY Tank Farm. It is also associated with 200-W-15.

Code: 200-W-207-PL

Type: Radioactive Process Sewer

Status: Active

Description: This pipeline has been split into two separate waste sites (200-W-207-PL-A - Inactive portion and 200-W-207-PL-B - Active portion). The original waste site was multiple branches of underground vitrified clay pipe that connected to manholes that originally discharged to the 216-Z-1, 216-Z-11 and 216-Z-19 ditches and the 216-Z-20 tile field.

Location: The process sewer lines extends south from the 234-5Z building and east to the 216-Z-1, 216-Z-11 and 216-Z-19 ditches. The pipeline was later diverted to the 216-Z-20 tile field.

Related Sites/Structures: The process sewer lines are associated with the 216-Z-1, 216-Z-11 and 216-Z-19 ditches and the 216-Z-20 tile field.

Process Description: Many of the process sewer branches are active and were connected to the Treated Effluent Disposal Facility (TEDF) system in 1995. (see H-2-140332 and H-2-140336). Parts of the process sewer were lined before connecting to the TEDF system. Some branches of the sewer are not radiologically contaminated, but other portions are known to have carried radioactive
waste.

<td>The waste site is the multiple, active branches of underground vitrified clay pipe that originate at the 235-5Z, 232-Z, 242-Z, 236-Z and 291-Z buildings and the process sewer manholes.</td>
<td></td>
</tr>
<tr>
<td>Location:</td>
<td>The process sewer extends south and east from the 234-5Z and supporting facilities. The active portion of the process sewer diverts to the Treated Effluent Disposal Facility (TEDF) pipeline near manhole Z8.</td>
<td></td>
</tr>
<tr>
<td>Related Sites/Structures:</td>
<td>The active process sewer is associated with the TEDF pipeline (WIDS sitecode 600-291).</td>
<td></td>
</tr>
<tr>
<td>Process Description:</td>
<td>The process sewer originally fed the 216-Z-1, 216-Z-11 and 216-Z-19 ditches. Later, it fed the 216-Z-20 ditch (see 200-W-207-PL-A). In 1981, the process sewer was reconfigured to accommodate the construction of the 232-Z building. Some of the original sections of process sewer piping were removed during the construction of the 232-Z building. Many of the process sewer branches are active and were connected to the Treated Effluent Disposal Facility (TEDF) system in 1995. (see H-2-140332 and H-2-140336). Parts of the process sewer were lined before connecting to the TEDF system. Some branches of the sewer are not radiologically contaminated, but other portions are known to have carried radioactive waste. The active process sewer was tied into the Treated Effluent Disposal Facility (TEDF) system in 1995 (see WIDS sitecode 600-291-PL) and by-passed the ditches. The effluent was redirected to the TEDF system at manhole Z8.</td>

**DOE/RL-88-30**

**Rev. 24**

---

**Code:** 213-W  
**Names:** 213-W; 213-W Compactor Facility  
**Type:** Process Unit/Plant  
**Status:** Active  
**Classification:** Accepted  
**Reclassification:** Rejected (7/10/2014)

**Description:** The waste site has been reclassified to Rejected. TPA-MP-14, Rev. 2, Section 2.0 states that WIDS does not document buildings or facilities that do not contain TSD units. It further states that, after buildings are demolished, the footprint will be evaluated for potential soil contamination. If present, the soil contamination will be added to WIDS as a Discovery Site.

213-W is a pre-engineered, self-framing structure originally designed as the Dry Waste Compactor Facility. The building contains three rooms: an entry room, a package inspection room, and the computer room. The entry room opens into the compactor room through an airlock. Vehicle doors open from the compactor room to the inspection room, and from the inspection room to the building exterior.

**Location:** The 213-W Facility is north of the 272-WA Building and west of the 2401-W Building.

**Related Sites/Structures:** Structures associated with the facility include the 213-W-1 tank, the container Products Corporation Model B60 compactor, the facility exhaust and HEPA system, sample and monitoring systems, and the other facilities making up the central waste complex.

**Process Description:** The Waste Compactor system was used to compact uncompressed low-level waste to approximately 10% of its original volume. The waste was compacted directly into steel burial boxes. Beginning in 1985, this process operated sporadically. Compactor operations ceased about 1994. The facility was transferred to 200 West Tank Farms in 1995. The 213-W Building is now used for equipment storage and occasionally to repair contaminated instruments.

**Waste Type:** Not Specified

**Waste Description:** The unit was used to compact low-level dry waste and occasion repairs of contaminated instruments. Residual contamination on the equipment is expected.

**Start Date:** 1/1/1985  
**End Date:** 1/1/1995

**Description:** The 213-W-TK-1 Retention Tank is a below grade steel tank. It was plumbed to the 213-W HVAC System, the 272-WA Service Garages, and the 213-W Compactor Room.

**Location:** This tank is located east of the 213-W Compactor Facility, and north of the 272-WA Building.

---

**Hanford Site Waste Management Units Report**

February 2015
**Process Description:** The unit collected drainage from floor drains in the 213-W Compactor Room, and the 272-WA Service Garage. The tank also received heating ventilation and air conditioning condensate. Water was released from the tank if no radionuclides were found during analysis.

**Waste Type:** Not Specified

**Waste Description:** The unit was used to collect drainage water from 272-WA service garages, drainage from the compactor room floor, and condensate from the high-efficiency particulate air filter system. The unit had the possibility of containing radioactive wastes in the event that they were introduced into the process. The water was analyzed periodically for radioactive materials. After analysis, the water was released if no radioactive materials were present. The IMUST Checklist and Photo report, issued in April 1998, states the tank contains non-radioactive water.

---

### Code: 218-W-4C ANNEX
**Classification:** Not Accepted

### Names: 218-W-4C ANNEX; Unused Portion of 218-W-4C Burial Ground

### Type: Burial Ground

### Status: Inactive

**Location:** The 218-W-4C annex section is located directly south of the 234-5 building, north of 16th Street.

**Description:** The annex area looks like a barren field. The area designated for additional waste trenches in the western portion of the 218-W-4C Burial ground was never used.

**Related Sites/Structures:** The 218-W-4C Annex is associated with WIDS sitecode 200-W-242, which documents a small amount of debris.

**Process Description:** The 218-W-4C burial ground and annex were designed to contain up to 65 trenches. The main burial ground was designed to include forty-eight trenches, orientated east to west. The burial ground annex was designed to include seventeen trenches, running north to south. The burial ground annex area has never been used.

---

### Code: 218-W-6
**Classification:** Accepted

### Names: 218-W-6; 218-W-6 Burial Ground

### Type: Burial Ground

### Status: Inactive

**Description:** The site had been delineated with light posts and chain. It is marked with signs that say "Danger - Keep Out - Authorized Personnel Only". The area had been designated as a RCRA burial ground, but never used for that purpose. It had been listed on the RCRA Part A Permit for the Low Level Burial Grounds. This waste site was administratively Closed Out in December 2011.

**Location:** The site is inside 200 West Area. The site extends south from 27th Street to north of the 218-W-1A Burial Ground and east to the 218-W-3AE Burial Ground.
### 2607-W2 Septic Tank

- **Code:** 2607-W2  
- **Names:** 2607-W2  
- **Type:** Septic Tank  
- **Status:** Inactive  
- **Start Date:** 1/1/1980  
- **End Date:** 1/1/1994  
- **Classification:** Accepted  
- **Reclassification:** None  

**Description:** The 2607-W2 Septic Tank is surrounded by posts with no radiation warning signs. This system was taken out of service and formally abandoned in 1994. The drainfield lines have been cut and the septic tank was filled with soil. The drainfield had a capacity of 785 gallons (2,970 liters) per day. A gravity tie-line was installed to connect this small system to a collection that serves 2607-W1.

**Location:** This unit lies southwest of the main 200 West Area guard gate and southeast of the 2704-W Building.

**Related Sites/Structures:** The 2607-W2 Septic Tank was associated with the 2709-W, the 2720-W and the 2701-WA Buildings.

**Process Description:** The 2607-W2 Septic Tank and associated drain field were designed to accept sanitary sewer effluent from the 2709-W, the 2720-W and the 2701-WA Buildings.

### 2607-W10 Septic Tank

- **Code:** 2607-W10  
- **Names:** 2607-W10; MO-281 and MO-438; Septic Servicing 278-WA  
- **Type:** Septic Tank  
- **Status:** Active  
- **Start Date:** 1/1/1993  
- **End Date:**  
- **Classification:** Accepted  
- **Reclassification:** None  

**Location:** The 2607-W10 septic system is located west of Dayton Ave. and south of 19th Street.

**Process Description:** 2607-W10 septic services the 278-WA, MO-281 and MO-438 buildings.

### 2607-W11 Septic Tank

- **Code:** 2607-W11  
- **Names:** 2607-W11; Septic Servicing MO-720  
- **Type:** Septic Tank  
- **Status:** Active  
- **Start Date:** 1/1/1993  
- **End Date:**  
- **Classification:** Accepted  
- **Reclassification:** None  

**Location:** The 2607-W11 septic system is located west of Dayton Ave. and south of 19th Street.

**Process Description:** The 2607-W11 septic system services MO-720.

### 2607-W12 Septic Tank

- **Code:** 2607-W12  
- **Names:** 2607-W12; Septic Servicing MO-721 and MO-743  
- **Type:** Septic Tank  
- **Status:** Active  
- **Start Date:** 1/1/1993  
- **End Date:**  
- **Classification:** Accepted  
- **Reclassification:** None  

**Location:**

| Code: | 2607-WB | Classification: | Accepted |
Names: 2607-WB; 2607-WB Septic System  Reclassification: Closed Out (2/26/2001)
Type: Septic Tank  Start Date:
Status: Inactive  End Date: 1/1/1999
Description: The site is a septic system that consists of three inactive septic tanks, one drain field, and the underground lines from connecting the tanks and drain field to the mobile offices they serviced. The septic tank was properly abandoned in 1999.
Location: The septic tanks are south of MO-016 (200 West - Z Plant Area). The drain field is south of MO-939.
Related Sites/Structures: The septic system serviced mobile offices MO-016, MO-015, MO-017, MO-939, MO-032, MO-031. These trailers are outside of the Z-Plant fence line.
Closure Info: The reclassification to Closed Out is documented on form 99-104. The septic system was abandoned per the requirements of Washington Administrative Code 246-272-1851. All septage inside the tanks was removed and the empty tanks were filled to eliminate void spaces. Per an agreement with the Washington Department of Health, the septic system lids were left in place.

Code: 2607-WWA  Classification: Not Accepted
Names: 2607-WWA; 2607-WWA Septic System  Reclassification: None
Type: Septic Tank  Start Date: 1/1/1955
Status: Inactive  End Date:
Description: This site does not exist as a separate site; it is likely an alias for 2607-WL.
Process Description: Septic Tank and drain fields are designed to accept and treat sanitary sewer effluent from associated structures.

Code: 2727-WA  Classification: Accepted
Names: 2727-WA; 2727-WA SRE Sodium Storage Building  Reclassification: Closed Out (2/22/1999)
Type: Storage  Start Date: 1/1/1977
Status: Inactive  End Date: 1/1/1999
Description: The 2727-WA building was constructed to store sodium from the Sodium Reactor Experiment (SRE) reactor. It is a prefabricated Butler-type metal building with a concrete floor. All of the SRE sodium storage containers were removed in 1995. The RCRA Part A permit was procedurally Closed in 1999.
Location: The 2727-WA building is located in 200 West area, north of 16th Street and just east of the rail line.
Process Description: The sodium stored in this facility was transferred to the Hanford Site in 1977 after use by Atomics International as primary coolant in their Sodium Reactor Experiment (SRE reactor). The containers of sodium were purged of air and internally blanketed with nitrogen when filled at Atomics International. In February, 1995, the 158 sodium-filled 208-liter (55-gallon) drums were overpacked into 322-liter (85-gallon) drums and transferred to the South Alkali Metal (SAM) Storage Modules in the 200 West Central Waste Complex.
Closure Info: February, 1995, the 158 sodium-filled 208-liter (55-gallon) drums were overpacked into 322-liter (85-gallon) drums and transferred to the South Alkali Metal (SAM) Storage Modules in the 200 West Central Waste Complex. The RCRA Part A permit was procedurally closed in 1999.

Code: 232-Z:1  
Classification: Accepted  
Names: 232-Z:1; Building Foundation; 232-Z Facility Concrete Slab  
Reclassification: None  
Type: Process Unit/Plant  
Start Date:  
Status: Inactive  
End Date:  
Description: The 232-Z above grade structures were demolished to slab on grade in July 2006. All penetrations through the floor slab were plugged with grout or a fire block material (low density silicone elastomer) prior to building demolition. The slab was painted with Polymeric Barrier System fixative, covered with gravel and posted with Underground Radioactive Material signs. Fixed contamination was identified on the sidewalk between 232-Z and 2731-ZA. The sidewalk was sprayed with a vinyl material and painted yellow. A section of asphalt south of 2736-ZC (adjacent to 232-Z) was found to be contaminated. This area was re-surfaced with asphalt. All areas were posted as Underground Radioactive Material Areas (URMA).

The SubSite is Part Of:  
Code: 232-Z  

Code: 232-Z:2  
Classification: Accepted  
Names: 232-Z:2; 232-Z Underground Ventilation Duct  
Reclassification: None  
Type: Process Unit/Plant  
Start Date:  
Status: Inactive  
End Date:  
Description: In 2006, the 60 and 91 centimeter (24 and 36 inch) diameter underground ventilation ducting from the 232-Z Building to the 291-Z Building was filled with a controlled density fill (i.e., grout).

The SubSite is Part Of:  
Code: 232-Z  

Code: 232-Z:3  
Classification: Accepted  
Names: 232-Z:3; 232-Z Underground Drain Line to 241-Z  
Reclassification: None  
Type: Process Unit/Plant  
Start Date:  
Status: Inactive  
End Date:  
Description: The 7.6 centimeter (3 inch) diameter underground pipeline drained to the 241-Z facility tank D-6. Water that was removed from the buried three inch drain line was sampled. The water was generally measured at less than 10-3 Ci/mL alpha (M2300-06-010, 232-Z Building Final Slab-On-Grade Characterization Report).
### The SubSite is Part Of:

**Code:** 232-Z  
**Names:** 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility

### Related Sites/Structures:
- **Classification:** Accepted
- **Reclassification:** Rejected (9/14/2000)

### Code: 234-5Z HWSA  
**Classification:** Accepted

### Names: 234-5Z HWSA; 234-5Z Hazardous Waste Storage Area

### Type: Storage Pad (<90 day)

### Status: Active

#### Start Date: 1/1/1985

#### End Date: 

#### Description: The unit consists of a portable steel building, similar to a conex box, with no windows and three doors that open to three internal bays. The conex box is located on an asphalt pad.

#### Location: The unit is located east of 234-5Z, along the inner security fence line, 15 meters (50 feet) east of the northeast corner of the 234-5Z Building (Z Plant).

#### Related Sites/Structures: Structures related to this unit include the 234-5Z Facility and other facilities in the Plutonium Finishing Plant Complex that stage waste at the pad.

#### Process Description: This unit provides a temporary staging area for hazardous wastes generated in the Plutonium Finishing Plant Complex.

### Code: 2607-Z8  
**Classification:** Accepted

### Names: 2607-Z8

### Type: Septic Tank

### Status: Inactive

#### Start Date: 

#### End Date: 

#### Description: WIDS site 2607-Z8 was described in Hanford Site Waste Management Units Report, May 1987 as a septic tank and associated drain field. However, No drawings have been found that show this septic system. It likely does not exist.

#### Location: This septic system has been described as being located along the fence southeast of the 234-5Z Building.

### Code: 300 IFBD  
**Classification:** Accepted

### Names: 300 IFBD; 300 Area Interim Filter Backwash Disposal

### Type: Depression/Pit (nonspecific)

### Status: Inactive

#### Start Date: 1/1/1987

#### End Date: 1/1/1987

#### Description: This site was a temporary disposal area for filter backwash from the 300 Area Filter Water Plant. There is a large, depressed area on the east side of the Gravel Pit 6 property that forms a natural basin. There is a moderate amount of rabbit brush and grasses growing on it. There are no definite, visible signs that the area was used for backwash disposal. However, there are some truck tire tracks and evidence of some grayish, silty sand on the surface in some areas of the natural basin.

#### Location: The disposal area is located inside the Gravel Pit 6 property boundaries, south of the 300 Area.
Vitrification Test Site and west of the 300 Area. It is on the west side of Route 4 South. The depressed area believed to be the disposal site is on the east side of the property.

**Process Description:**
The area was used to dispose of filter backwash material for four months (January through April) in 1987. Filter backwash effluent was trucked to this area.

---

**Code:** 300 PHWSA  
**Classification:** Accepted

**Names:** 300 PHWSA; 300 Area Powerhouse Hazardous Waste Storage Area; 300 Area Powerhouse HWSA

**Reclassification:** Rejected (1/27/1999)

**Type:** Satellite Accumulation Area  
**Start Date:** 1/1/1991

**Status:** Inactive  
**End Date:** 1/1/1995

**Description:** The site was a hazardous waste storage area used to store nonradioactive solid waste. Currently, the site is an empty chain link fenced area.

**Location:** The unit is located near the southwest corner of the 384 Building adjacent to roll up door 3.

**Related Sites/Structures:** The site was associated with the operation of the 384 Powerhouse.

**Process Description:** The unit was used to stage nonregulated and hazardous material. Some of the material stored here included waste oil, lubricating oil, oil soaked rags and aerosol cans.

---

**Code:** 300 SE  
**Classification:** Accepted

**Names:** 300 SE; Solvent Evaporator; 300 Area Solvent Evaporator; 300 ASE

**Reclassification:** Closed Out (6/27/1995)

**Type:** Evaporator  
**Start Date:** 1/1/1975

**Status:** Inactive  
**End Date:** 1/1/1985

**Description:** The waste site permit has been Closed. It was a RCRA treatment (TSD) unit for radioactively contaminated spent solvents generated in the fuel fabrication process at the 300 Area. The waste solvents were treated by evaporation in a Brooks Load Lugger (i.e., tank, dumpster). The waste site consisted of a gravel area and a concrete pad.

**Location:** The site was located on a concrete pad and an adjacent graveled equipment area behind the 333 Building and next to the east end of the 334 Building.

**Release Description:** Although no formal spill report is known to exist, one spill is known to have occurred when a small hole developed in a fitting of the steam line (BHI-00012). Steam condensate collected in the evaporator until it overflowed. It was likely that the overflow spilled from the cutout side onto the northern edge of the evaporator area. It is estimated that very little, if any, solvent was released during this spill, as the bulk of the solvent being treated had a density greater than water and thus remained inside the evaporator.

**Process Description:** The 300 ASE was installed in the spring of 1976 and was a treatment tank (evaporator) that received barrels of accumulated solvent waste from degreasing operations associated with the N Reactor fuel manufacturing facility. Degreaser solvent barrels were routinely stored (up to 1 year) within about 6.1 meters (20 feet) of the evaporator until poured into the 300 ASE with the barrel lift/dumper. Small quantities of solvent (from the paint shop) and uranium-ethyl acetate-bromine solutions were poured by hand directly into the evaporator. Typical 300 ASE waste was composed of perchloroethylene, trichloroethylene, chloroform, ethyl acetate/bromine.
solution, paint shop solvents, and possibly used oil. Small amounts of uranium and alloys of copper, zirconium, and possibly zirconium/beryllium were present in the degreaser solvents as machining particulates. In 1985, the 300 ASE was phased out. The Brooks load lugger was dismantled between 1985 and 1986.

Closure Info: The RCRA TSD was closed on 7/31/1995.

The 300 ASE closure area consisted of two sub-areas located at the south side of the 333 East Concrete Pad. One area was a concrete pad that measured about 15.2 meters (50 feet) long on the south portion of the original 333 East Concrete Pad. The second area was an adjacent gravel/soil area along the south edge of the concrete pad that measured approximately 3.1 meters (10 feet) wide by 15.2 meters (50 feet) long.

Soil samples were collected in August 1993 and analyzed, cadmium, copper and lead were found in concentrations above the Hanford Site Background levels. The results for copper in the soil ranged from 26.8 to 109 milligrams per kilogram, well below the Model Toxics Control Act (MTCA) Method B cleanup level of 3,000 milligrams per kilogram. The MTCA Method A cleanup level was used for lead because data for the Method B cleanup level calculation were not available. The soil results for lead ranged from 9.4 to 101 milligrams per kilogram, well below the MTCA Method A cleanup level of 250 milligrams per kilogram. The one cadmium result of 1.0 milligram per kilogram, was below the MTCA Method A cleanup level of 2.0 milligrams per kilogram.

Concrete core samples were collected and analyzed in April 1994.

<tr>
<td>Description:</td>
<td>The sewer system is comprised of underground sewer lines inside the 300 Area that connect to the City of Richland sewer system. On October 1, 1996 the 300 Area Sanitary Sewer System began to discharge to the City of Richland's sewage system. The transfer point is at a junction south of 300 Area, on George Washington Way. Various Hanford contractors have been responsible for the operation, maintenance, monitoring and reporting for the portions of the system inside the 300 Area. Prior to 1996, the sewer was connected to septic tanks and sanitary leaching trenches located northeast of the 300 Area. The 300 Area Sanitary Sewer utilized gravity and pressure collection lines, septic tanks and leaching trenches. The original sewer system was constructed of concrete and clay pipes and was designated as the 3907 system. The system was connected to a tile field that was replaced, in 1951, by a septic tank and two leaching trenches. Additional septic tanks were added in 1975. The 300 Area Sanitary Trenches (WIDS Site 300-52) site includes two septic tanks and unlined trenches that were connected to the 300 Area Sanitary Sewer System. The 300 Area Sanitary Trenches (WIDS Site 300-52) is a &quot;no action&quot; site in the 300-FF-1 Operable Unit.</td>
<td></td>
</tr>
<tr>
<td>Location:</td>
<td>The system is located underneath the 300 Area. The sewer sampling station is located on the George Washington Way extension, south of the 300 Area. There are two lift stations. One is located northeast of the 337 Building and the other is northeast of the 306-E Building.</td>
<td>Site associated with 300-52 Sanitary Trenches and 300-276.</td>
</tr>
</tbody>
</table>
**Process Description:** The site receives sanitary waste from throughout the 300 Area. The 300 Area Sanitary Sewer utilizes gravity flow and lift stations to send sanitary waste to the City of Richland.

**Names:** 300-12; 325 Laboratory Diesel Fuel Tank
**Type:** Storage Tank
**Status:** Inactive

**Description:** The tank had been located at the northwest corner of the 325 Building. It was a single underground diesel fuel storage tank. It was taken out of service and removed (including accessible piping) in October, 1992. Sampling was performed at the time of tank removal. The site currently appears as a paved area between the building and air conditioning equipment. It can be distinguished from surrounding pavement by its newer appearance.

**Location:** The tank was located approximately 5 meters (17 feet) west of the northwest corner of the 325 Radiochemistry Laboratory Building.

**Related Sites/Structures:** This unit was associated with the 325 Building.

**Process Description:** The tank was used to store diesel fuel for an emergency generator located beside the 325 building.

**Names:** 300-13; 350 Building Release to Sanitary Sewer System
**Type:** Unplanned Release
**Status:** Inactive

**Description:** The site is an unplanned release to the 300 Area Sanitary Sewer System. The site was discovered during routine surveillance and maintenance of the 350 Building Sanitary Sewer Lift Station. The lift station is a below grade sewage pump station accessible through a raised manhole, painted white and located in the grassy strip of land on the west side of the 350 Building between the security fence and the roadway. A gray electrical panel is located adjacent to and on the east side of the manhole. The panel houses the controls for the sewer lift pumps.

**Location:** The site is located northwest of the 350 Building and just south of the access roadway to the storage yard on the north side of the 350 Building. It can be identified by the electrical panel adjacent to and on the east side of the access cover for the station.

**Related Sites/Structures:** The site is associated with the 300 Area Sanitary Sewer System, 350 Building, 350A Building, and 350B Building.

**Process Description:** The lift station is used to pump sanitary wastes into the 300 Area Sanitary Sewer System. Sewage is collected from 350 Building, 350A Building, 350B Building and pumped to a sewer tie-in just north of the lift station.

**Names:** 300-14; 331 Building Animal Waste Tanks Pit
**Type:** Depression/Pit (nonspecific)  
**Start Date:** 1/1/1974

**Status:** Inactive  
**End Date:** 1/1/1977

**Description:** This site includes the unlined pit east of the building, a backwash storage tank, and six diversion chambers that are located north of the pit. Originally, the animal waste collection tanks were located in a pit just east of the 331-D Animal Waste Treatment Building. The pit is 28.0 meters (92 feet) by 22.3 meters (73 feet) and approximately 7.6 meters (25 feet) deep. The sides of the pit slope about 30 degrees. The tanks have been removed. Eight concrete tank pedestals remain at the bottom of the pit. A stairway leads to the bottom of the pit. A backwash storage tank remains between the 331-D building and the pit. Water was observed at the bottom of the pit. Six diversion chambers for the sewer system are located northwest of the pit.

**Location:** Using the Cypress Street entrance to the 300 Area, the site is located on the right side of the street within the 331 Complex.

**Related Sites/Structures:** The site is related to the Animal Waste Sewer and 331-D Complex.

**Process Description:** The 331-D Animal Waste Treatment Facility consists of a semi-high bay, prefabricated, metal Butler building erected on a concrete slab. It contained a 94,625 liters (25,000 gallon) per day capacity waste treatment plant that operated to chemically treat, mechanically flocculate and settle, and then gravity filter animal wastes. A sludge dryer also was installed to heat and dry 54.4 kilograms (120 pounds) per hour of sewage sludge product from the treatment facility and to produce a 65 to 100% waste material that could be buried in the 100 and 200 Area trenches. The animal waste collection tanks located in a pit just east of the 331-D building were associated with this process. This treatment facility was needed because hog hairs, sawdust, and undigested animal feed frequently plugged the unlined animal waste pit located along the Columbia River.

---

**Code:** 300-17  
**Classification:** Not Accepted

**Names:** 300-17; 331 Building Trench; 331-D Ditch; Outfall A

**Type:** Ditch  
**Start Date:**

**Status:** Active  
**End Date:**

**Description:** The site is a ditch that runs from the southeast corner of the 331-D Building to the top of the west bank of the Columbia River. The ditch is fed by an underground pipe which drains stormwater from the roadway between the north side of Building 331-C and the south side of Building 331. The open trench is piped to a culvert passing beneath a gravel roadway and the perimeter fence. The discharge is approximately 46 meters (150 feet) from the river. The bank is moderately sloped with natural vegetation. This outfall results from non-industrial sources. The site has a natural berm at the fence line. No erosion is evident on the sloping bank.

**Location:** The ditch is located in the 300 Area, in the southeast corner of the 331 Complex, between the 331-D and 331-E Buildings.

**Process Description:** The site collects sediment and runoff from storage yards and loading docks.

---

**Code:** 300-19  
**Classification:** Accepted

**Names:** 300-19; 324 Building Sodium Removal Pilot

**Reclassification:** Closed Out (6/9/1997)
Plant; 324 Sodium Removal Pilot Plant

Type: Process Unit/Plant          Start Date: 1/1/1979
Status: Inactive                  End Date: 1/1/1987

Description: The Sodium Removal Pilot Plant consisted of a reaction vessel, a nitrogen gas supply, a steam supply, and equipment for decontamination studies. The reaction vessel was decommissioned and removed in 1991. The RCRA Part A Permit Application was procedurally Closed on June 6, 1997.

Location: The unit was located within room 146 of the 324 Building, Chemical Materials Engineering Laboratory.

Related Sites/Structures: Structures associated with the unit include the 324 Highbay, the highbay crane, plumbing, and pressure vessels.

Process Description: The unit has been inactive since 1987. From 1983 to 1987 the unit was used to clean and decontaminate test equipment, reactor components, and other sodium contaminated parts. Before 1983 the system was used to treat small amounts of alkali metals for research and development and to perform equipment decontamination.

Closure Info: The RCRA Part A Permit Application was procedurally closed on June 6, 1997. The reclassification was documented on form 98-68.

---

Code: 300-21                          Classification: Not Accepted
Names: 300-21; 333 Building Underground Limestone Tank
Type: Neutralization Tank            Start Date: 1/1/1973
Status: Inactive                     End Date: 1/1/1973

Description: The site was an underground storage tank that held limestone used to neutralize acid wastes. The Waste Acid Treatment System (WATS) Limestone Neutralization Tank leaked in 1973 and was removed.

Location: The tank was located east of the 333 Building and north of the 334 Tank Farm. The 334A Building was built where the tank had been located. The tank was located within the 618-1 Burial Ground (WIDS Site 618-1).

Release Description: The release to the soil is described in the Releases Section. The release site (WIDS Site UPR-300-13) is a separate waste site.

Related Sites/Structures: The site is associated with the 333 Building process etch facilities and the associated drain lines (WIDS Site 300-219), Tank 4 in the 334 Tank Farm (WIDS Site 334 TFWAST), the 334-A Facility, and the process sewer. The site is also associated with UPR-300-13, a release to the soil of waste etch acid solution.

Process Description: Prior to mid-1971, the majority of the concentrated chemical wastes from the 333 Building chemical tanks were transferred via polyvinyl chloride (PVC) drain lines in the pipe trench to this 14,380 liter (3800 gallon) plastic-lined, steel tank full of limestone. The waste etch acid solutions were sprayed over the top of the limestone and the neutralized acid waste drained from the bottom of the tank into the process sewer. Limestone was added to the top of the tank during the week as needed. The acid-limestone contact time was increased in 1971 by batch transfers to the tank to maintain at least a 12 hour hold up prior to draining to the process sewer. From late 1971 to August 1973, in an effort to further reduce chemical waste disposal within the 300 Area, the underground limestone neutralization tank was converted to a catch tank to collect and pump batches of waste etch acid to Tank 4 in the 334 Tank Farm. Tank 4 (WIDS
Site 334 TFWAST), a 22,710 liter (6000 gallon) elevated tank, was used to store the waste acid solution and to transfer batches of the waste acid solutions to a neutralization tank (WIDS Site 313-TK-2) in the 313 Uranium Recovery Room. The 334-A Facility was built to replace the failed tank. The collection of batches of waste etch acids in the 334-A Facility catch tanks (WIDS Sites 334-A-TK-B and 334-A-TK-C) started in January 1975. The process for neutralization of the waste etch acids in the 333 waste acid neutralization tank continued from January 1975 until the 333 N Fuels Fabrication processes were shutdown in about 1988.

---

**Classification:** Accepted

**Reclassification:** Closed Out (10/24/1996)

**Start Date:** 1/1/1959

**End Date:** 1/1/1969

**Description:** The waste site is an underground storage tank that has been removed and the trench backfilled. The tank held diesel fuel used to power the Plutonium Recycle Test Reactor (PRTR) emergency generator located inside the 309 Building.

**Location:** The tank was located approximately 6.1 meters (20 feet) south of the 309 building and next to the main entrance of the 309 building.

**Related Sites/Structures:** The associated structure was the Plutonium Recycle Test Reactor (PRTR), 309 Building.

**Closure Info:** A site assessment was conducted following the guidance from the Washington State Department of Ecology, Guidance for Site Checks and Site Assessments for Underground Storage Tanks. The objective was to determine if a release of diesel fuel had occurred prior to the tank being abandoned. The assessment is described in Site Assessment Report for the 309-1 Underground Storage Tank (UST), correspondence control number 036527. The tank was excavated and examined for potential leaks. No discolored soil was observed. There was no groundwater in the tank excavation. The results of the site assessment indicated that a confirmed release of a regulated substance had not occurred.

---

**Classification:** Accepted

**Reclassification:** None

**Start Date:** 1/1/1966

**End Date:**

**Description:** The 324 Building is a substantial concrete and steel structure. Portions of the Building are covered under a RCRA Closure Plan with on-going closure activities in progress. The 324 Building is divided into four integrated-but-separate primary work areas: the Engineering Development Laboratory-102 (non radioactive) or EDL-102, the Engineering Development Laboratory-146 (radioactive) or EDL-146, the radiochemical engineering cells (REC), and the Shielded Materials Facility (SMF). Additional facilities in the 324 Building include development laboratories, maintenance shops, and service areas. Within the 324 Building are controlled experimentation areas referred to as 'hot cells' with radiation shielding provided by thick concrete walls. To protect against releases of radioactive material from the hot cells to the environment, integral metal liners with sumps (i.e., without drains) were installed in the cells and tank vaults. Confinement of radioactive particulate matter within the shielded cells is provided by a directed air flow through high-efficiency particulate air (HEPA) filter ventilation system. The RCRA Closure Plan covers the REC portion of the building, including the hot...
cells, low level and high level vault tanks, the airlock and pipe trench. See DOE/RL-96-73, Rev. 1 (3-98) for additional details. In July of 1999, the Washington State Department of Ecology identified the following as areas of interest for this facility: - 324 Shielded Material Facility (SMF) South Cell - 324 Shielded Material Facility (SMF) East Cell - B-Cell (Hot Cell) - A-Cell (Hot Cell) - C-Cell (Hot Cell) - D-Cell (Hot Cell) - Hot Cell Airlock (Hot Cell) - High-Level Vault (4 tanks) - Low-Level Vault (4 tanks) - 324 Process Sewer System (WIDS site 300-15) - 324 Retention Process Sewer System (WIDS site 300-214) - EDL-102 (PNNL Vitrification Pilot) - High Bay (2 tanks with heels) - Room 146 (Fume hood - melter) - Room 3B, 3F (Laboratory and Rad Flume Hood), and Storage Vault - Waste Water Diverter System, Catch Tank and Ion Exchange Tank - HNO3 Bulk Chemical Tank - West Side of Facility. The areas listed above that are within the boundaries of the TSD facility are: - B-Cell (Hot Cell) - A-Cell (Hot Cell) - C-Cell (Hot Cell) - D-Cell (Hot Cell) - Hot Cell Airlock (Hot Cell) - High-Level Vault (4 tanks) - Low-Level Vault (4 tanks).

Location: The 324 building is in the central part of the 300 Area, northeast of the 309 Building and immediately east of the 308 Building.

Release Description: On 11/16/10, a cone penetrometer (an enclosed pipe pushed into the soil by a hydraulic ram) was used to identify the presence of radioactive material in the soil approximately 3.5 feet beneath the 324 Building near the B-cell. A maximum radiation readings of 6,700 R/hr. was identified. The 324 Building is a Nuclear Category 2 facility, currently undergoing deactivation and decommissioning. The 324 Building was constructed in the 1960s to support materials and chemical process research and development activities, and ceased research operations in 1996. The primary operational system remaining in the building is ventilation. In preparation for removal of B-cell, historical research and on-site investigation identified evidence of a potentially breached liner in the sump floor. A leak may have occurred at some point in the operational past of the cell. The 300 Area is posted as an Underground Radioactive Material (URM) Area. This event is being reported as a Management Concern due to the unexpected very high levels of radiation. (See sitecode 300-296)

Related Sites/Structures: The 324 Building has been isolated from the RLWS by installing a blank in the diverter valve. The pipes going from Tanks 102 and 177 to the 324 RLWS were cut and capped. The main 324 pipe that connected with the 340 Facility pipe has been cut and capped. The 324 building is associated with Unplanned Release 300-296.

Process Description: The 324 Building was designed and constructed to allow for a high degree of versatility in completing complex and varied experimentation on highly radioactive wastes developing approaches for waste treatment and storage activities. The building was designed as a single integrated facility for orderly progression of nonradioactive and radioactive development studies from laboratory or bench-scale to full engineering-scale pilot plant demonstrations. The facility houses radiochemical and radiometallurgical hot cells and laboratories. The facility supported several DOE/RL related initiatives for highly radioactive chemical processing and metallurgical engineering studies. As a result of residues and internal facility spills during the conduct of these activities, the facility contains areas with significant fixed and dispersible mixed waste contamination.

Code: 300-26 Classification: Accepted
Names: 300-26; 384 Powerhouse #6 Fuel Oil Spill; Delivery Truck Spillage on Roads; Powerhouse Fuel Oil Spill
Reclassification: Rejected (1/27/1999)
Type: Unplanned Release Start Date: 1/1/1991
Status: Inactive End Date: 1/1/1991
Description: The site was an unplanned release. The area of the release was previously used as a coal pile
for the 384 Powerhouse. The soil is stained dark from coal dust. There is no visible evidence of the #6 fuel oil spill in the area. On the south side of the site adjacent to Apple Street there is an Underground Radioactive Material sign, and a buried gas pipeline.

**Location:** The site is located on the east side of the 384 Powerhouse, just south of the 366 Fuel Oil Bunker, at the refueling area.

**Release Description:** After refueling of the 366 Fuel Oil Bunkers, an offsite vendor's fuel oil truck spilled #6 fuel oil during departure onto the gravel and paved road. The driver stated that he had left a siphon tube valve cracked open which released the fuel oil to the ground. The date of the spill was December 31, 1991.

**Related Sites/Structures:** The site is associated with the 384 Powerhouse and 366/366A Fuel Oil Bunkers (WIDS Site 300-6).

---

**Code:** 300-27  
**Classification:** Accepted  
**Reclassification:** Rejected (2/12/1999)

**Names:** 300-27; Soil Contamination at 329 Biophysics Laboratory

**Type:** Unplanned Release  
**Start Date:** 1/1/1991  
**End Date:** 1/1/1991

**Description:** Radioactive contamination was found at the site during a routine survey on August 14, 1991. The site is an area of crushed rock gravel with no vegetation located near the outside wall of the 329 Building. There are no hazard postings at this location. There is no visible evidence of radioactive contamination that was removed from this site. A cement pad with a liquid argon tank has been constructed adjacent to the site.

**Location:** The contamination was found in soil just west of Door 12 on the northeast section of the 329 Building.

**Release Description:** During a routine radiation survey outside of the building on August 14, 1991, a Radiation Protection Technologist (RPT) found radioactive contamination levels of approximately 40,000 disintegrations per minute (dpm) beta-gamma in a one square foot area of soil. Pacific Northwest Laboratory (PNL) was unable to identify the source of the contamination. The contamination was not found during a prior survey in 1990. This site was found within several feet of the outer wall of the 329 Biophysics Laboratory. The source of the contamination is unknown.

---

**Code:** 300-30  
**Classification:** Accepted  
**Reclassification:** Rejected (1/27/1999)

**Names:** 300-30; 3705 Photography Building

**Type:** Process Unit/Plant  
**Start Date:** 1/1/1963  
**End Date:**

**Description:** The 3705 Photography Building was demolished in June 2006. The 3705 Building was a rectangular, one-story concrete block building erected on concrete footings and a slab-on-grade concrete floor. A corrugated metal sided mechanical room penthouse had been erected on the building roof. The roof itself was flat and is covered with built-up tar and gravel. The building contained no windows. Interior partitions were either gypsum wall board on stud frames or movable metal. Utilities serving the building included sanitary water and sewer, compressed air, process water, and electricity. The building was connected to the process sewer, but all connections were capped when the building was remodeled, probably between 1988 and 1990. The capped process sewer connection for the silver reclamation process is located behind a...
sheet rock wall that has been marked with an identification sticker.

Location: The 3705 Photography Building was inside the 300 Area, just north of the Apple Street Gate. It is on the west side of Alaska Street.

Related Sites/Structures: The site is associated with the 300 Area Sanitary and Process Sewers (WIDS Sites 300 SSS and 300-15) and the 3746-D Silver Reclamation Process Facility (WIDS Site 3746-D SR).

Process Description: From 1963 through the early 1970's, the building was used to process personnel dosimetry badges and meters. Various radioactive sources were kept and used at the facility. In 1968, a 1.96 microcurie americium-241 source was found to be ruptured and the contamination was subsequently cleaned up (See Releases Section). Since the early 1970's, the facility has provided photographic services, including still camera assignments, color slides work, contract printing, and black and white or color enlargements. Within the facility is the silver reclamation unit that is used to treat the spent photoprocessing chemicals to recover silver for recycling. During the silver reclamation process, liquids from film processing are run through a chemical recovery column (CRC) that precipitates out silver. The building use to be connected to the process sewer and the sanitary sewer. All process sewer connections were capped when the building was remodeled, probably between 1988 and 1990. The silver depleted liquid effluent produced from the silver reclamation process is a nonregulated, nonhazardous waste that is no longer discharged to the sanitary sewer. It is collected in 114 liter (30 gallon) drums and then sent offsite for disposal. The silver enriched CRC's are treated as recyclable material and periodically sent to a refiner for processing. Washwater and overflow from the developers is sent to the City of Richland sanitary sewer. Prior to 1998, this waste stream went to the 300 Area Sanitary Sewer Trenches (WIDS Site 300 SSS).

---

Code: 300-35 Classification: Accepted
Names: 300-35; 3706A Fuel Storage Tank Reclassification: Closed Out (2/12/1999)
Type: Storage Tank Start Date:
Status: Inactive End Date:
Description: The site is an abandoned underground fuel storage tank that has been reclassified to Closed Out. The tank was pumped and abandoned in place. A 0.51 meter by 0.51 meter (1.7 feet by 1.7 feet) concrete block and sign, at the tank fill connection location, marked the location of the underground tank. The sign read "EMPTY 300 GALLON UNDERGROUND DIESEL FUEL TANK LOCATED HERE. CONTACT MAINTENANCE Environmental Services South (376-7210) for information".
Location: The tank marker is located 1 meter (3.3 feet) from the south wall of the 3706-A Building and 6.1 meters (20 feet) west of the southeast corner of the building.
Release Description: A review of the facility operating history did not reveal any reported instances of diesel spills. It is anticipated that the normal trace amounts of diesel near the filler connection may be present.
Related Sites/Structures: The site is associated with the emergency generator.
Process Description: The underground diesel fuel storage tank was used to support emergency generator operations for heating, ventilation, and air conditioning (HVAC).
Closure Info: The tank was pumped and closed in place. A message on 2/10/1995 from Ted Wooley of the Washington State Department of Ecology says "It appears that the information provided would allow exemption (e.g., abandonment or closure prior to December 22, 1988) under WAC 173-360." A second email on 3/15/1995 says that "After re-evaluating the data, Ecology agrees that the appropriate disposal steps were taken with the waste water collected. Moreover, closure of
the tank in place can serve as final closure of the tank.”

The reclassification to Closed Out is documented on from 99-03.

</tr>
<tr>
<td>Description: Reclassification form 98-231 documents the reclassification to Closed Out. The reclassification status was changed to Rejected in 2013 because the PCB material had been properly dispositioned under TSCA. The site was a polychlorinated biphenyl (PCB) leak that contaminated the soil. The leak originated from a rectifier located on a concrete pad outside of the 335-A Building. The rectifier was installed in the early 1970’s, but was never activated. The tank was drained and the concrete was removed in 1993 and 1994, before the TPA-MP-14 process was established.</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Release Description: The polychlorinated biphenyl (PCB) leakage was first identified in April 1993 by the Electrical Utilities personnel. The leakage was observed at two fittings, one being the lower drain valve located near the edge of the concrete pad. The leaks appeared to be small and old, presumably pre-1987. The leaking fittings were covered over with a dirty grease-like coating. There was no visual evidence of oil on the concrete pad or soil surrounding the pad. In addition, there was</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
no distinctive PCB odor at the leak site. The site was immediately roped off and plans for removal of the PCBs were initiated.

Related Sites/Structures:
The site was associated with a rectifier, which has been removed.

Closure Info:
The rectifier was drained on August 2 and 4, 1993. The fluid contained a PCB level of 680,000 parts per million. The amount of oil in the rectifier at delivery was indicated on the unit at 6,113 liters (1,615 gallons). The amount of fluid removed, approximately 5,867 liters (1,550 gallons), was consistent with the fill data provided on the unit. The 246 liter (65 gallon) differential is typical of the quantity of oil that can not be removed from the rectifier cooling coils. This fluid and the drained rectifier were shipped off site to a licensed PCB disposal facility. After removal of this material, the concrete pad was smeared and PCB contamination of 12,000 parts per million was found in the area below the suspect fittings.

On July 19, 1994 the concrete pad was removed, packaged into drums and shipped off site for disposal as PCB contaminated waste. Crews also removed soil, approximately 2.4 meters by 2.4 meters by 0.3 meters (8 feet by 8 feet by 1 foot) deep, and sampled this soil for PCBs. The soil was also visually inspected during removal. There was no visual evidence of oil in the soil, nor was the distinctive PCB odor present.

The activity occurred in 1993 and 1994, prior to the establishment of the TPA-MP-14 process.

The PCB Case Reviewer for the EPA (Environmental Protection Agency) agreed that appropriate action had taken place, and from a Toxic Substances Control Act (TSCA) standpoint, regulations were met as long as the soil was less than 10 parts per million PCBs at a depth of 25 centimeters (10 inches) below the surface.

</tbody>
</table>

- **Type:** Storage
- **Start Date:** 1/1/1960
- **End Date:** 1/1/1974

**Location:** The site is located inside the 309 building, in the east wing and south of the PRTR Reactor Cell. Rooms 404A, 404B, and 405 are located directly above the Fuel Storage Basin.
The Fuel Transfer Pit and its associated structures (Hoist Pit, Sluice Gate Operating Stand, and Drain) are located inside the 309 PRTR containment dome. The Ion Vault and Truck Bay are located within the Fuel Storage Basin. Facility drawing H-3-14950 indicates two overflow drain systems, neither of which is believed to be plugged at the basin. One drain system goes into PRTR tank farm tank TW-3. The SP-100 project cut the drain line in the area underneath where the dump heat exchangers were located in the 1986-1988 timeframe. The other drain system goes into the 300 Area process sewer via manholes MH-4 and MH-1A. Lines in MH-1A were plugged in 1996. The drawings also indicate two cells on the eastern-most end of the expansion basin that contained water purification equipment for the basin and a truck lock. The truck lock allowed a truck to back into the basin area for fuel load out. UPR-300-5 is a spill associated with this site.

The main air lock from the reactor containment vessel opens into the storage basin area which is the point of connection of the service building and reactor containment vessel. An underwater fuel transfer opening between the containment vessel and the storage basin permitted irradiated fuel elements to be moved to the basin for storage or "green fuel" to the reactor for recharging. A fuel element loadout facility adjoins the storage basin area on the east side. It is from this facility that elements were loaded in shielding casks and shipped to the 327 Building or the 200 Area by truck.

**Related Sites/Structures:**

- The 306E Development Fabrication Test Lab was demolished in January 2007 (per D4-300-004 Rev. 1). The waste site was the 306E Building. The area around the 306E building is paved and posted as Underground Radioactive Material Area.
- The building had been occupied by COGEMA and used for instrument development and Computer Aided Design (CAD) support.
- The 306E Building was on the north side of Ginko Street, in the northeast corner of the 300 Area.
- See WIDS Site 300-256 for a description of releases to the soil beneath the 306E Facility.
- The site is related to the 306W building, 313 Building, 333 building, 300 Area process sewer, 300 Area sanitary sewer, and WIDS Site 300-258, Abandoned Pipe Trench Between 334 Tank Farm and 306E. Contamination beneath this facility is documented as WIDS Site Code 300-33.
- The original 306 Building was completed in 1956 and named the Fuel Element Pilot Plant. The facility was constructed to support the 313 Building operations. It was expanded in 1960 to contain the co-extrusion fabrication processes for N Reactor fuels fabrication. In 1972, the east half, the new half, was designated as 306E and that portion of the building became the Hanford Engineering Development Laboratory (HEDL) operated by Westinghouse Electric Corporation. The west portion of the building, which is older, was named 306W and was allocated to Pacific Northwest Laboratories (PNL).

Status: Inactive  
End Date: 1/1/1989

Description: During the demolition of the 3708 facility, the 300-47 WIDS site location was removed. No visual evidence was found of potential contamination at the 300-47 site during removal of the 3708 building foundation concrete slab. The site was identified as two locations of potential contamination near the 3708 Building that resulted from tank leakage. The area around the 3708 Building is not currently posted for contamination and there is no evidence of underground tanks. The area is partially paved with asphalt, and otherwise surfaced in crushed gravel. There are no markers where the chemical tank and the oil tank were located.

Location: The site is located in 300 Area just off the northwest corner of the 3708 Building.

Release Description: No releases have been identified.

Related Sites/Structures: The two areas of potential contamination are associated with the 3708 Building.

Process Description: The tanks were chemical holding tanks containing waste from floor, shower, and sink drains in the 3708 Building, and an underground oil storage tank.

---

Code: 300-55  
Classification: Accepted

Names: 300-55; 307-D; 309 Rupture Loop Holding Tank; RLT-2; Rupture Loop Hold-Up Tank

Reclassification: Rejected (2/24/1999)

Type: Storage Tank  
Start Date: 1/1/1960

Status: Inactive  
End Date: 

Description: The tank was an underground storage tank, 12.2 meters (40 feet) in diameter and 3.05 meters (10 feet) tall with a sloping top.

Location: The Rupture Loop Holding Tank was located approximately 61 meters (200 feet) northeast of the 309 Facility and southwest of the 324 building.

Related Sites/Structures: The site was related to the 309 Building, Rupture Loop Annex (Room 20), valve pit and piping. There were two piping runs that were connected to the tank. For contaminated material, a 7.6 centimeter (3 inch) pipe ran to the 340 Complex, and for uncontaminated material, a pipe ran to the Columbia River (See WIDS Site 300-257).

Process Description: Liquid waste routed to this tank was sampled. If it was contaminated it was sent to the 340 Complex through a 7.6 centimeter (3 inch) underground pipeline. If the waste was not contaminated, it was diverted to the Columbia River via a 1 meter (3 foot) diameter outfall line.

---

Code: 300-56  
Classification: Accepted

Names: 300-56; 306-E 90-Day Waste Accumulation Area

Reclassification: Rejected (1/27/1999)

Type: Storage Pad (<90 day)  
Start Date: 

Status: Inactive  
End Date: 

Description: The site is a steel storage container designed to contain hazardous materials or waste. The site was previously used as a 90 day waste storage area. The site is currently in use as a hazardous
material storage area. Materials currently stored include laboratory chemicals, a 208 liter (55 gallon) drum for waste oil recycling, and 320 kilograms (700 pounds) of peanut butter (sludge simulant).

Location: The site is located approximately 20 meters (65 feet) north of the northeast corner of the 306E Building in the 300 area.

Release Description: The material was/is contained within a storage cabinet. No information has been provided related to any potential spills at the site.

Related Sites/Structures: The site stores hazardous materials or waste from the 306E building.

| Type:      | French Drain         |
| Status:    | Inactive             |
| Description: | The site is a french drain, identified as miscellaneous stream #449, was properly decommissioned in 2007. The unit was a concrete pipe that is flush with the ground surface, and filled with cobbles and sand. No pipes to the drain are visible. The "Inventory of Miscellaneous Streams", Revision 3 says the site is inactive, source abandoned. The french drain could also drain stormwater from nearby asphalt roads in very heavy rain. The original purpose of the site was likely to have been used for steam condensate. The soil and rocks are rust stained showing evidence of its use as a steam condensate drain. In addition, a steam line is located over the site. Although stormwater may enter the site, it is not necessarily conveyed to it. |
| Location:  | The site is located 3.01 meters (10 feet) from the southwest corner of 305B Building. |
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-61
Names: 300-61; 303B Building Steam Condensate; Injection Well #12; Miscellaneous Stream #444
Type: Injection/Reverse Well
Status: Inactive
Description: The drain was decommissioned in 2012. The site had been described as an injection well. No engineered structure was evident at the location described for this site. Two steam lines labeled HPD-TRP-011 and HPD-TRP-12 were found; both are described in the "Inventory of Miscellaneous Streams," Revision 3. These two lines descend from the overhead line and disappear into the ground. A third line from the overhead steam line is found just east of HPD-TRP-011 and -012. This third line is unlabeled and terminates open-ended approximately 10 centimeters (3.9 inches) above the base of the wooden pole that supports it. The ground surface in this area is covered by gravel. According to the "Inventory of Miscellaneous Stream," Revision 3, this site is inactive, source abandoned.

Location: The site is north/northeast of the northeast corner of 303B and northwest of the northwest corner of 3732.

Related Sites/Structures: The site is related to the 300 Area main steam line. The "Inventory of Miscellaneous Streams," Revision 3, relates this discharge to the 303B Building, but that relation appear to be based only on proximity since 303B never received steam.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<tr>
<td>Description:</td>
<td>In September 2006, the top three feet of the structure was removed and the drain was backfilled. The site was a 0.6 meter (2 foot) diameter concrete french drain, 0.5 meters (1.5 feet) deep, with a perforated steel plate cover, flush with the alley road. About 0.3 meters (1 foot) from the top was a 6 centimeter (3 inch) diameter drain pipe that goes toward the west. Construction drawings H-3-52655 and H-3-304714 sheet 2 show that the open bottom catch basin/french drain location is connected directly to the (300-15) process sewer pipeline.</td>
</tr>
<tr>
<td>Location:</td>
<td>The french drain was on the south side of the 305B Building, at the edge of a gravel slope and the paved alley. The site is 6.2 meters (20.5 feet) south-southeast of the corner of 305B and the downspout for the roof stormwater runoff.</td>
</tr>
<tr>
<td>Process Description:</td>
<td>The site appears to be just stormwater runoff.</td>
</tr>
</tbody>
</table>

The site was an HVAC steam condensate return to the WATS Pipe Trench (WIDS Site 300-224). The discharge went into a rectangular concrete base covered by a 0.90 meter (2.95 foot) by 2.45 meter (8.04 foot) metal lid. Some of the concrete base appears to be rusty. The site was also surrounded by concrete. The lid was posted "Confined Space." There were three openings cut in the metal lid to allow pipes to pass through. An approximately 2.5 centimeter (1 inch) diameter metal pipe entered the middle opening. This pipe was labeled "P198" and appears to be electrical in nature. A second approximately 2.5 centimeter (1 inch) diameter metal pipe entered the south opening. There is a label on the wall next to this pipe that reads "NP-303F-01." This second pipe extends approximately 2 meters (6.6 feet) above the lid, makes a 90 degree turn away from 303F and terminates open-ended over one of the steam lines that enters the west wall of 303F. An approximately 10 centimeter (4 inch) diameter steam pipe and an approximately 2.5 centimeter (1 inch) diameter metal pipe enter the north opening. These two pipes extend down from the building's roof. According to John Remaize, the lines from the roof of 303F are HVAC and cooling lines. The lid does not fit tightly; there are openings between the lid and the concrete base. These openings could allow stormwater runoff from the 303F
Building to enter. These opening also allow a limited view of the interior of the structure. Although it is difficult to see inside, the floor of the interior appeared to be dry during the October 29, 1998, walkdown. However, there also appeared to be more pipes inside than could be accounted for by those entering through the lid. Drawing H-3-304714, Sheet 2, shows the WATS and U-Bearing Pipe Trench (WIDS Site 300-224) enters/leaves WIDS Site 300-64 and connects to the 313 Building.

The site is on the east end of a row of removable panels labeled "Radioactive Material, Internally Contaminated." 303F is posted "Fixed Contamination Area" and the 303F roof is posted "Contamination Area." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

Location: The site is located on the west side of the 303F Building, just south of the door.

Related Sites/Structures: The site is associated with the 303F Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Reclassification:

Code: 300-65
Classification: Accepted
Reclassification: Rejected (9/2/1998)
Names: 300-65; 303J Building - Steam Condensate Mud Leg (Part of 300 Main Supply); Miscellaneous Stream #266
Type: French Drain
Status: Inactive
Start Date:
End Date:
Description: The french drain has been decommissioned. The site was a 0.35 meter (14 inch) diameter steel pipe in the ground, about 0.8 meters (2.5 feet) deep. The drain had covered with a steel plate with notches and holes for vents and two steam condensate pipes to enter. According to the miscellaneous streams report (Revision 3), the stream has been eliminated because the steam source has bee shut off. Signs on the 303J Building say that it is a closed facility, and no material is stored inside.
Location: The french drain was located in the center of the south side of the 303J Building, about 5 centimeters (2 inches) from the wall.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Reclassification:

Code: 300-66
Classification: Accepted
Reclassification: Rejected (9/2/1998)
Names: 300-66; 303J Building HVAC Condensate; Miscellaneous Stream #267
Type: Injection/Reverse Well
Start Date:
**Status:** Inactive

**Description:** The french drain structure was removed with the 300-6 waste site. The site was an open concrete french drain. Two pipes exited from about the ceiling level of the 303J Building and discharge to the drain. The concrete drain was filled with sand and small rocks and it does not appear to have been used recently. The "Inventory of Miscellaneous Streams", Revision 3 lists the site as a steam condensate site. The responsible contractor believes the site to be an HVAC condensate drain (as it was listed in the previous "Inventory of Miscellaneous Streams", Revision 2).

**Location:** The site is immediately adjacent to the 303J Building, in the center of the north side.

**Related Sites/Structures:**
The 303J Building has been closed and is vacant.

**Process Description:** The Heating, Ventilation, and Air Conditioning (HVAC) system generates condensate on the coils from the air. The condensate is collected by the HVAC unit and it is drained to the french drain.

**Names:**

- 300-67; Miscellaneous Stream #414; Steam Condensate from 300 Area Main Steam Header

**Type:** Injection/Reverse Well

**Status:** Inactive

**Description:** In January 2006, the structure was filled with grout. The site was an injection well that received steam condensate. Two metal lids and the metal lid frame were visible. The lid frame measured 1.90 meters (6.23 feet) by 0.82 meters (2.69 feet) and is flush with the ground surface. The site is just east of an access manhole for the process sewers, which is labeled "Radioactive Material, Internally Contaminated." The "Inventory of Miscellaneous Streams," Revision 2, states when this injection well was in service, it overflowed to the process sewer. The 303B Building was posted "Fissile Materials," "Radiation Area and Radioactive Material Area," and "Fixed Contamination Area." The roof of the 303B Building was also posted "Contamination Area." The 304 Building was posted "Fixed Contamination Area." This site was slightly down slope of the road to the north. There are small openings in the lid where stormwater runoff from the road may be able to enter the injection well. It did not appear as though runoff from the two buildings would be inclined to flow towards the site; the area between the buildings and the site was fairly level. The site was surrounded by gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

**Location:** The site is located northwest of 303B and northeast of the 304 Building, just south of the overhead steam line.

**Related Sites/Structures:**
The site is associated with the 300 Area main steam header.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.
In September 2006, the top three feet of structure was removed and then backfilled. The site was an injection well. The base of the injection well was constructed of corrugated metal and was covered by a 1.91 meter (6.27 foot) metal lid. The lid is approximately 30 centimeters (11.8 inches) above grade and was labeled "U-23" and "Confined Space." Two pipes enter the lid from the overhead steam lines. One of these pipes was approximately 20 centimeters (7.9 inches) in diameter and the other was approximately 6 centimeters (2.4 inches) in diameter. The site was surrounded by soil and gravel. The "Inventory of Miscellaneous Streams," Revision 3, says the site is inactive, source abandoned.

Location: The site is on the south side of the 305 building. It is just south and east of the entry door; between the entry door and the metal stairwell.

Related Sites/Structures: The site is associated with the 305 building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<td>Description:</td>
<td>The drain was decommissioned in 2012. The site is an injection well that used to receive HVAC condensate. The injection well is constructed of concrete pipe and is covered by a 0.54 meter (1.77 foot) round metal lid with handles. The top of the pipe rises approximately 4 centimeters (1.6 inches) above the ground surface. During the December 17, 1998, walkdown, the interior of the well appeared to be damp. This may have been due to condensation since there was condensation on the bottom of the lid. The well appears to be 20 centimeters (0.66 feet) deep with the bottom covered by cobbles. No pipes were visible entering the well. What appeared to be a black widow was living on the bottom side of the lid. The site is hidden behind an old air conditioning unit that is labeled &quot;6&quot; on its north side and SeasonCon on its south side. The site is surrounded by sand which has been discolored by garnet dust. According to the &quot;Inventory of Miscellaneous Streams,&quot; Revision 3, the site is inactive, source abandoned.</td>

The Heating, Ventilation, and Air Conditioning (HVAC) system generated condensate on the coils from the air. The condensate was collected by the HVAC unit and drained to the french drain.

The site was an injection well that was removed during the demolition of the 308 building. The structure was removed during the demolition of the 308 building. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 2/1/2013. It received stormwater runoff from the surrounding area. The site was covered by a 0.66 meter (2.17 foot) metal lid with perforations. The lid was flush with the surrounding concrete.

During the November 8, 1998, walkdown, water could be seen through the perforations in the lid. It had rained three days prior to the walkdown. Sand has washed down the truck ramp and has partially covered the lid. The "Inventory of Miscellaneous Streams," Revision 3, states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.

The site was located in the southernmost of two truck ramps at the northeast corner of the 308 Building. It was located in the ramp with a roll-up door labeled "48."

The waste site was an injection well that received stormwater runoff from the surrounding area. The structure was removed during the demolition of the 308 building. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 2/1/2013. The site had been covered by a 0.18 meter (0.59 foot) metal grate.

At the time of the November 8, 1998, walkdown, the site was surrounded by approximately 7 centimeters (2.8 inches) of sand and debris. The drain itself was also filled with sand and debris. It had rained three days prior to the walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The document also states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.
Location: The site was located in the northernmost of two truck ramps at the northeast corner of the 308 Building. The site was in the truck ramp with the roll-up door labeled "46." It was set into a notch in the ramp's concrete.

Related Sites/Structures: The site is associated with the 308 Building.

Start Date: End Date:
Description: The waste site was an injection well that received stormwater runoff. The structure was removed during the demolition of the 308 building. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 2/1/2013.

It had a concrete base and was covered by a 0.64 meter (2.10 foot) by 0.64 meter (2.10 foot) metal grate. A sign on the grate read "Drains to R.P.S." Sand and gravel covered part of the concrete surrounding the grate.

The top of the concrete was flush with the ground surface on its south and west sides. The north side was approximately 1 to 5 centimeters (0.4 to 2 inches) above the ground surface. The east side of the concrete rose above the asphalt surface of the truck ramp. At the time of the November 8, 1998, walkdown, the site was filled with water and water had pooled in the adjacent truck ramp. It had rained three day's prior to the walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site has been grouted. It is inactive and listed as, "Disposal Site Permanently Abandoned." The document also states "Disposal site within 300 feet of an active/inactive crib, ditch or trench." The site is within 91 meters (300 feet) of 316-3 Trench.

Location: The site was next to a truck ramp on the north side of the 308 Building, near the northwest corner of the building. It was located at the bottom of a short staircase from the truck ramp to the loading dock.

Related Sites/Structures: The site is associated with the 308 Building. The 308 Building is inactive.

Code: 300-75 Classification: Accepted
Names: 300-75; 309 Building Stormwater Runoff and Chiller Water; Injection Well #20; Miscellaneous Stream #445
Reclassification: Rejected (1/19/1999)
Type: Injection/Reverse Well
Status: Inactive
Start Date: End Date:
Description: The site is an injection well that received stormwater runoff and water from a chiller. The well is a concrete pipe covered by a 1.11 meter (3.64 foot) diameter metal lid. The top of the pipe is approximately 2.5 centimeters (1 inch) above grade. The lid is labeled "Confined Space." The site is surrounded by yellow safety posts and asphalt. John Remaize stated that the chiller has
been removed. According to the "Inventory of Miscellaneous Streams," Revision 3, the drain has been permanently plugged and the stream has been routed to a process sewer. The document lists the site as inactive, "Source Permanently Abandoned."

Location: The site is located west of Door #11, which is the southernmost door on the west side of the south wing of the 309 Building.

Related Sites/Structures: The site is associated with the 309 Building.

Process Description: The chiller generated condensate on the coils from the air. The condensate was collected by the chiller unit and was drained to the injection well.

---

Code: 300-76 Classification: Accepted
Names: 300-76; 306W Building Steam Condensate; Miscellaneous Stream #418
Reclassification: Rejected (9/2/1998)
Type: French Drain Start Date:
Status: Inactive End Date:
Description: The site is a french drain that is a concrete pipe almost flush with the ground surface. A 2.54 centimeter (1 inch) metal pipe drops from an overhead steam line and drains to the unit. Adjacent steam drain lines may also enter the unit, but any connecting pipes are below the rocks that come to within about 15.2 centimeters (6 inches) of the top of the drain. The drain is covered with a round steel plate with four vent holes and a notch for the metal pipe. The rocks appear to be discolored from rust. The "Inventory of Miscellaneous Streams", Revision 3, says the site is inactive, source abandoned. The site does not appear to be active, but discharge pipe(s) is (are) still present (assuming adjacent pipes also discharge to the unit).
Location: The site is on the west side of the 306W Building, about 5.5 meters (18 feet) west of the west wall and about 21.3 meters (70 feet) north of the southwest corner.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

Code: 300-77 Classification: Not Accepted
Names: 300-77; 309 Building Stormwater Runoff; Miscellaneous Stream #450
Reclassification: None
Type: Process Sewer Start Date:
Status: Inactive End Date:
Description: The site is a 10.16 cm (4 in) storm drain that empties into the process sewer 300-15 (H-3-13532).
Location: The site is located at the bottom of the stairwell on the north side of the west wing of the 309 Building. The stairwell is below door #8.
Related Sites/Structures: The site is associated with the 309 Building.

<tr>
<td>Description:</td>
<td>The effluent source to this structure was removed when the 313 building was demolished in 2004. The waste site is a rectangular shaped below grade concrete box that is covered with two steel plates. Seven pipes of various sizes entered the site from the 313 building. Standing water was observed in the bottom of the site. A concrete lined 6.7 meters long by 0.356 meters wide by 0.330 deep (22 feet long by 14 inches wide by 13 inches deep) trench extended from the site to the south. An opening at the south end of the trench was observed and may lead to the process sewer. This trench may be an overflow in the event the concrete box fills with water. Steel grating covers the top of the trench. A concrete pad surrounding the site is painted gray and posted as fixed radiological contamination.</td>

are not visible. A 0.63 by 0.53 meter grate is visible in the gravel near the northeast corner of the 324 Building. The building escort for the 10-26-98 site visit pointed out that there is an identical grate at the southeast corner of the building, with a concrete trough leading to it to help direct water flow. The second grate is approximately 9 meters (30 feet) south of the one on the northeast corner. The two grates are in line with each other, parallel to the east side of the building. A PVC inlet and outlet pipe is visible through the grates. The two grates appear to be connected and are assumed to be stormwater collection points for the drainage system.

**Location:** The drain is located approximately 21.3 meters (70 feet) north of the northeast corner of the 324 building. A surface grate is located 1.2 meters (4 feet) east of the 324 Building, adjacent to the exhaust ventilation fans.

</table>

**Process Description:** Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

states the estimated backfill date of this drain is 10/1/2013. A 3.8 centimeter (1.5 inch) diameter pipe extends from the west wall of the 325 building to the french drain. It was a covered dry well that received Steam Condensate from the 325 building.

**Location:** The site is located on the west side of the 325 building.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

**Code:** 300-97  
**Classification:** Not Accepted  
**Names:** 300-97; 325 Building Stormwater Runoff and Fire System Testing Water; Miscellaneous Stream #706  
**Reclassification:** None  
**Type:** French Drain  
**Status:** Active  
**Description:** The site is a drain that is covered by a rusted perforated steel plate, 0.46 meters (1.5 feet) square. The site drains a small asphalt pad and a pipe coming out of bottom of the fire system shed. The drain cover plate appears to be sealed to the asphalt. Therefore, it was not possible to determine the depth of the site.  
**Location:** The site is located on the southeast side of the 325 Building, 3.96 meters (13 feet) from the building, and adjacent to the fire system shed that is attached to the 325 Building.  
**Related Sites/Structures:** Approximately, 12.2 meters (40 feet) south of the drain, a pipe exits out of a concrete wall onto the roadway. Another stormwater drain is at the bottom of the roadway. It was not possible to determine if 300-97 is attached to the pipe.

---

**Code:** 300-98  
**Classification:** Not Accepted  
**Names:** 300-98; 325 Building South Stairwell Drain; Miscellaneous Stream #264; 300-229  
**Reclassification:** None  
**Type:** French Drain  
**Status:** Active  
**Description:** The site is a 12.7 centimeter (5 inch) square floor drain at the bottom of a stairwell that drains stormwater from a leaky roof.  
**Location:** The site is located inside the 325 Building south stairwell.

---

**Code:** 300-99  
**Classification:** Accepted  
**Names:** 300-99; 325 Building Nitrogen Tank Blowdown Miscellaneous Stream #265; Injection Well #399-3  
**Reclassification:** Rejected (9/2/1998)  
**Type:** Injection/Reverse Well  
**Status:** Inactive
**Description:** The site is not visible without entering the confined space under the compressed gas storage loading dock. The loading dock has skirting around it, and therefore, the site is not visible. A limited field walkdown was performed for this site. No access could be gained to the site. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

**Location:** The site is located on the northeast corner of the 325 Building, under an elevated gas storage dock.

---

**Code:** 300-100  
**Names:** 300-100; 325 Building Stormwater Runoff; Miscellaneous Stream #408  
**Type:** French Drain  
**Status:** Inactive  
**Description:** The site drains stormwater from the chiller pad to the ground. The drain is covered with a 68.6 centimeter by 61 centimeter (27 inch by 24 inch) steel grate. The site is 22.9 centimeters - 25.4 centimeters (9 inches - 10 inches) deep and contains water just below the grating.

**Location:** The site is located on the east side of the 325 building on the chiller pad.

---

**Code:** 300-101  
**Names:** 300-101; 326 Building Stormwater Runoff and Steam Condensate; Miscellaneous Stream #409  
**Type:** Depression/Pit (nonspecific)  
**Status:** Active  
**Description:** According to the "Inventory of Miscellaneous Streams", Revision 3, the site is active for stormwater only. The disposal structure is a non-engineered structure.

The site is a roadway drain, with a 0.4 meter by 0.5 meter (1.3 foot by 1.7 foot) rectangular perforated steel cover. The cover is visible, but the structure is full of sand and gravel. The site drains stormwater from a loading dock and a large area of asphalt parking spaces. A steel pipe 3.7 meters (12 feet) away, on the side of the building, appears to be the steam condensate drain. Next to this pipe is a lock box that is marked with a "Radioactively controlled area" sign.

The steam condensate component for this site has been routed to the sanitary sewer.

**Location:** The site is on the east side of the 326 Building, below the loading dock, 1.3 meters (4.5 feet) from the dock. It is 3.7 meters (12 feet) northeast of the probable steam condensate drain line.

**Process Description:** Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

| Names: 300-111; 337 Building Stormwater Runoff; Miscellaneous Stream #516 | Reclassification: None |
| Type: French Drain | Start Date: |
| Status: Inactive | End Date: |
| Description: The site is a french drain; a round concrete pipe 0.7 meters (2.25 feet) in diameter, at least 1.2 meters (4 feet) deep. Water covers the bottom, so the total depth was not determined. The site drains stormwater from the asphalt alley way used to access the trash and recycled cardboard pickup containers, and provide pedestrian access to the 337 Building. The miscellaneous streams report says this site is a "non-engineered structure" and "deleted" but it does not appear to be either case. | |
| Location: The site is on the east side of the 337 Building, north of the cafeteria, in an open alley way. The drain is 7 meters (23 feet) from the east door into the 337 Building. | |
| Process Description: The site received only stormwater runoff. |
Code: 300-112  
Classification: Accepted  
Names: 300-112; 340 P-3 Pump Pit; Miscellaneous Stream #428; Retention Process Sewer Pump Pit #3 French Drain  
Reclassification: Rejected (1/15/1999)  
Type: Injection/Reverse Well  
Status: Inactive  
Start Date: 1/1/1996  
End Date:  
Description: The Pump Pit is an engineered structure with an entry hatch labeled "Non-Permit Confined Space". The drain is at the bottom of the pit. It has a perforated, circular cover that measures approximately 0.61 meters (2 feet) in diameter. The pumps and piping have been removed.  
Location: The drain is located at the bottom of the Retention Process Sewer Pump Pit (P-3 Pump Pit). The pump pit is located at the southeast corner of the 307 Retention Basins.  
Process Description: The drain received leakage and drainage from the pump. The pump was flushed with clean service water during routine freeze protection maintenance.

Code: 300-113  
Classification: Accepted  
Names: 300-113; 340 Building Steam Condensate/ Water Heater Overflow; Miscellaneous Stream #341  
Reclassification: Rejected (1/15/1999)  
Type: Injection/Reverse Well  
Status: Inactive  
Start Date: 1/1/1996  
End Date:  
Description: The drain is a 0.46 meter (18 inch) diameter metal pipe that extends slightly above grade. A 1.3 centimeter (0.5 inch) diameter pipe exits the building wall and terminates over the drain. The pipe is connected to a water heater overflow valve, that is inside the 340 Building. Before the steam utility was removed from the building, the drain received steam condensate.  
Location: The drain is located at the southwest corner of the 340 Building.  
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-114  
Classification: Accepted  
Names: 300-114; 340A Building Steam Condensate; Miscellaneous Stream #427  
Reclassification: Rejected (1/15/1999)  
Type: Injection/Reverse Well  
Status: Inactive  
Start Date: 1/1/1996  
End Date:  
Description: Currently, there are no visual surface features. The drain area was backfilled with clean gravel when the steam system was removed from the building. The gravel over the drain is slightly darker than the other gravel in the area.  
Location: The site is located east of the 340A building, adjacent to the chain link fence.
Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Related Sites/Structures:
The site is associated with the 340A Building.

Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. Code: 300-115
Classification: Not Accepted
Names: 300-115; 340B Building Backflow Preventer Emergency Drain; Miscellaneous Stream #426
Reclassification: None
Type: Injection/Reverse Well
Start Date: 1/1/1996
End Date:
Status: Inactive
Description: Currently, there are no visible surface features. The drain was covered with clean gravel when the source was abandoned in 1996. The gravel over the drain is slightly darker than the other gravel in the area. At least some component of the structure has been removed. The gravel would not cover the height of the exposed part of the structure. It may be that the lip of the structure was knocked into the drain or the entire drain may have been removed.
Location: The drain is located near the southeast corner of the 340B building.
Related Sites/Structures: The site was related to the 340B Building and the service water backflow preventer.

Code: 300-116
Classification: Accepted
Names: 300-116; 3506A Building Steam Condensate; Miscellaneous Stream #381
Reclassification: Rejected (12/15/1998)
Type: French Drain
Start Date: End Date:
Status: Inactive
Description: The site was a french drain that is covered by a 0.48 meter (1.57 foot) by 0.48 meter (1.57 foot) square metal lid. It was removed during the demolition of the 3506A and 3506B facilities in December 2012.
Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).
Location: The site is located approximately 3.5 meters (11.5 feet) east of the north entry door of the 3506A Building.
Related Sites/Structures: The site is associated with the 3506A Building and steam trap, HPD-TRP-057.

Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Description:**
The site was a french drain that is constructed of concrete. It was removed during the demolition of the 3506A and 3506B facilities in December 2012. The area was backfilled in January 2013.

The top of the drain was flush with the ground surface and covered by two metal lids. Both lids were labeled "Confined Space." A metal pipe, 0.1 meters (0.3 feet) in diameter and 0.24 meters (0.79 feet) in length, extended vertically from the west lid. The metal pipe appeared to be a vent. It did not appear to extend into the cavity of the french drain. Two pipes from the overhead steam line entered the ground nearby. The drain was surrounded by gravel and a metal safety barricade. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

**Location:**
The site is just west of the northeast corner of the 3506A Building.

**Related Sites/Structures:**
The site is associated with the 3506A Building.

**Process Description:**
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Description:**
The site is a valve pit with a dirt floor. Steam condensate was discharged onto the floor of the pit. The pit has a square concrete base. It is at the bottom of a slope so the top of the concrete base ranges from 21 to 35 centimeters (8.3 to 13.8 inches) above the ground surface. The valve pit is covered by an inset, square metal lid that is 0.81 meters (2.66 feet) by 0.81 meters (2.66 feet). The lid is labeled "Confined Space" and "U-7." Three valves are visible nearby (MSS-V-337, MSS-V-030 and HPD-V-3041A). Two pipes approximately 3.5 centimeters (1.4 inches) in diameter extend from the concrete base, one on the south side and one on the west side. These two pipes then make a 90 degree turn and enter the ground. During the site walkdown, a ladder, pipes and valves were visible inside the drain. Condensation was visible on the bottom of the lid and moisture was visible on the pipes and valves inside the pit and closest to the lid. At least three valves and five pipes were observed inside the structure. Also visible was an underground area that opens up to the east of the inlet. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.
Location: The site is southwest of the northwest corner of the 3621D Building. It is outside the fence that surrounds the building. The 3621D building is located southeast of the intersection of Locust Street and George Washington Way.

Related Sites/Structures: The site is related to the 300 Area Condensate Return System.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-119
Names: 300-119; 3621D Air/Condensate Blowdown Drain; 3621D HVAC Condensate; Miscellaneous Stream #401
Type: Injection/Reverse Well
Status: Inactive
Description: The site status was changed to inactive since Miscellaneous Stream #401 was removed in February 2011 when the 3621-D Building was demolished (per CCN 157847). The drain had been an open corrugated metal pipe filled with rocks. The source pipe exited the building wall and with a 90 degree elbow to connect the pipe to the french drain. The building wall and the french drain rocks were stained with rust. The drain structure was removed when the 3621-D building was demolished.
Location: The drain is located adjacent to the east wall of the 3621-D building inside the fenced area. The 3621D building is located southeast of the intersection of Locust Street and the George Washington Way extension.

Related Sites/Structures: The site is related to 3621D Building.

Code: 300-120
Names: 300-120; 3621D Air Driven Starter Motor Discharge Drain; 3621D Building Diesel Generator Cooling System Condensate; Miscellaneous Stream #402
Type: Injection/Reverse Well
Status: Inactive
Description: The drain structure was removed when the 3621-D building was demolished. The site was a 0.9 meter (2.9 feet) diameter concrete structure with a metal grate cover. The unit was filled with rocks. Four pipes, one for each air starter motor, exited the west wall of the 3621D building near the foundation. The pipes teed into a larger aboveground line that runs south, parallel to the building wall. The line elbowed to the west and then down where it is attached to the grate. The grate and the rocks were stained with a black, oily substance.
Location: The drain is located approximately 1.2 meters (4 feet) from the west wall of the 3621D
The 3621D building is located southeast of the intersection of Locust Street and the George Washington Way extension.

<tr>
<td>Description:</td>
<td>The french drain structure was removed with the 300-6 waste site. The site was a french drain that received steam condensate from the 366 Building fuel oil bunker loading station. Only a small portion of the french drain's pipe was exposed. It could not be ascertained whether the pipe was composed of clay or discolored concrete. The drain was covered with a 0.65 meter (2.13 foot) rusted metal cover and the soil and gravel surrounding the site appears to be discolored by rust. The top of the lid is 5 to 8 centimeters (2 to 3.1 inches) above ground surface. There are also granular ash deposits on the ground in the general area east/northeast of the 384 powerhouse. The ground surface surrounding the site is slightly depressed which could allow the pooling of stormwater. The site is less than a meter (3.3 feet) south of a line of posts labeled &quot;Radiologically Controlled Area&quot; that appears to surround the 3715 and 303E buildings. LPD-TRP-053, -057 and -058 are on a concrete pad at the northwest corner of the 366 Building. There is a black, tar-like residue on this pad. According to the &quot;Inventory of Miscellaneous Streams,&quot; Revision 3, there was a potential for fuel oil to contaminate the discharge. The document also states the site is inactive, source abandoned.</td>

**End Date:**  
**Description:** The site was a french drain that collected steam condensate. The previous location of the 3703 Building is currently a cobble and gravel covered field. No evidence of a french drain was visible during the site walkdown. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source permanently abandoned.

**Location:** According to the "Inventory of Miscellaneous Streams," Revision 3, the site was located at the south center of the 3703 Building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-127
Names: 300-127; 3705 Building Stormwater Runoff; Miscellaneous Stream #410
Type: French Drain
Status: Inactive
Description: The waste site is a subsurface 16 ft long, 4 in perforated drain tile structure. The drain structure was removed during the demolition of the 3705 building, but the tile structure remains in place. Drawing research shows the effluent associated with Miscellaneous Stream #410 discharged to the subsurface perforated drain structure. Stormwater collected in the perforated, sloped pipe and discharged to the soil.
Location: The "Inventory of Miscellaneous Streams," Revision 3, states the site is located at the northeast corner of the 3705 Building.
Related Sites/Structures: The Miscellaneous Stream site is associated with the 3705 Building.

Process Description: Stormwater was discharged from the building down spout to a 4 in cast iron pipe that discharged to the drywell structure. The drywell structure is a subsurface 16 ft long, 4 in perforated drain tile with open joints. The top of the pipe is located 3 feet below grade. The pipe trench is 6 feet wide at the top and tapers to 4 feet wide at a depth of 7 feet. The drywell structure is filled is in layers of sand and gravel.

**Description:** The site is a french drain that is the discharge point for fire sprinkler system water. The drain is a clay pipe with the outer diameter of 0.42 meters (1.38 feet) and is not covered by a lid. The top of the clay pipe is above grade except where moss is encroaching. The pipe appears to be filled with cobbles and rocks to within 0.3 meters (0.98 feet) of its top. The rocks and cobbles inside the drain appear rusty. Above the site are two capped metal ports labeled "Fire Department Connection." Below these ports, two metal pipes extend from the building and terminate with open ends above the drain. One of these pipes is approximately 5 centimeters (2 inches) in diameter and the other is approximately 2 centimeters (0.8 inches) in diameter. During the October 26, 1998, walkdown, an opening in the side of the building for a third pipe was observed; this opening has not been plugged. The site is surrounded by sand, gravel and moss. The south side of the drain abuts the 3706 Building, which is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

**Location:** The site is located on the north side of the 3706 Building. It is approximately 5.5 meters (18 feet) east of door #06.

**Release Description:** There were no known hazardous or radioactive releases from this water discharge.

**Related Sites/Structures:** The site is associated with the 3706 Building.

**This Site Was Consolidated With:**

**Description:** The site has been described as a french drain that received steam condensate. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

During the November 18, 1998, walkdown, there did not appear to be an engineered structure at the site's location. The site appears to be a rock and cobble filled depression next to the 3706 Building. The depression is surrounded by soil-covered asphalt. The rocks and cobbles in the depression as well as the side of the 3706 Building appear to be rust stained. On the south side
of Door #02, an approximately 10 centimeter (4 inch) diameter metal pipe exits the east side of the 3706 Building, turns and enters the ground. Forty centimeters (1.3 feet) to the east of this pipe is a concrete structure with a 0.66 meter (2.17 feet) by 0.66 meter (2.17 feet) metal cover. In addition to steam condensate, the site also appears to have received fire sprinkler system water. Four metal pipes terminate over the depression. Three of these four pipes exit the east side of the 3706 Building near a Fire Department Connection. An approximately 2 centimeter (0.8 inch) diameter metal pipe extends from the building 0.95 meters (3.1 feet) above the ground surface; an approximately 6 centimeter (2.4 inch) diameter metal pipe extends from the building 0.90 meters (3 feet) above the ground surface and an approximately 4 centimeter (1.6 inch) metal pipe extends from the building 0.8 meters (2.6 feet) above the ground surface. These three pipes terminate open-ended over the depression. The fourth pipe is approximately 8 centimeters (3.1 inches) in diameter and exits the building 3 to 4 meters (9.8 to 13.1 feet) above the ground surface. It could not be ascertained whether this pipe is still open or whether it had been plugged. There is a U-shaped section of 8 centimeter (3.1 inches) pipe attached to the east wall of the 3706 Building just below the Fire Department Connection; this section of pipe has open ends. According to John Remaize, the steam and fire water for the building are still active. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is on the east side of the 3706 Building, just north of door #02.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-133
Names: 300-133; 3706 Building Steam Condensate; Injection Well #27; Miscellaneous Stream #367
Type: French Drain
Status: Inactive
Description: The site is a french drain that used to receive steam condensate. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC). The drain has a square concrete base with a 0.66 meter (2.17 foot) by 0.66 meter (2.17 foot) metal lid. What appear to be rust stains are on the lid and surrounding concrete. The remains of
"FD 27" written in paint can be seen on the side of the building next to the site. There is also writing on the metal lid but it is illegible due to age. Two metal pipes, both approximately 3.5 centimeters (1.4 inches) in diameter, extend from the east side of the 3706 Building and enter the lid. A metal pipe elbow extends from the ground between the site and 3706. This pipe is approximately 5 centimeters (2 inches) in diameter and terminates open ended. A third steam pipe extends from the east side of the 3706 Building approximately 2.5 meters (8.2 feet) north of the site. This pipe terminates approximately 0.5 meters (1.6 feet) above the ground surface and appears to have been plugged. The site is surrounded by concrete and sand. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

**Location:**
Located north of the former Health Service Center on the east side of 3706.

**Release Description:**
There were no known hazardous or radioactive releases from this steam condensate discharge.

**Related Sites/Structures:**
The site is associated with the 3706 Building.

**Process Description:**
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. Names: 300-135; 3706 Building Steam Condensate; Miscellaneous Stream #365
Classification: Accepted
Reclassification: Consolidated (1/19/1999)
Type: French Drain
Status: Inactive
Start Date: 
End Date: 

Description: The site is a french drain that received steam condensate. The drain is a clay pipe that abuts the north wall of the 3706 Building. The top of the clay pipe ranges from 2 to 4 centimeters (0.8 to 1.6 inches) above the ground surface, except on its southwest side where the pipe is broken. Stormwater runoff may be able to enter the drain through this break. The drain is covered by a 0.77 meter (2.53 foot) metal lid with two handles and an opening that could allow condensate pipes to enter. Any lines that may have entered the drain have been removed; no lines were visible during the November 20, 1998, walkdown. However, there are at least three plugged holes visible in the building wall above the site. These holes are 0.75 meters (2.5 feet), 1.52 meters (5 feet) and 1.7 meters (5.6 feet) above the ground surface. The drain is next to an HVAC unit with a label that reads "RM 13 HVAC MAIN DISC." The site is surrounded by sand, gravel and cobbles. Moss is growing along the north wall of the building and between the drain and the building. Standing water was visible inside the drain during the November 20, 1998, walkdown. Approximately 1 meter (3.2 feet) of the drain was visible above the water. No pipes or openings were visible inside the drain. John Remaize believes this stream is actually the site just west of Door #06. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is on the north side of the 3706 Building, east of Door #07 and just west of an HVAC unit.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to
produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

*Hanford Site Waste Management Units Report*

February 2015
Miscellaneous Stream #440

Type: French Drain

Status: Inactive

Description: Nineteen recognized miscellaneous stream drains were located within the boundary of the 3706 waste site and have been consolidated with 300-46.

The site has been described as a french drain that received steam condensate. During the November 20, 1998, walkdown, an engineered structure could not be discerned. It could not be ascertained whether or not the condensate stream was active or not, but the overhead steam line from 3706-BA, which is on the opposite side of Apple Street, to the 3706 Building did appear to be active - water was dripping from a valve labeled MSS-V-3706. The overhead steam line splits in two outside the 3706 Building. One of the lines enters the north side of the building and the other disappears into the sand. The latter is approximately 9 centimeters (3.6 inches) in diameter. There are pipes extending from the 3706 Building on either side of this site. John Remaize believes this site is actually located just west of the third window west of Door #06. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is on the north side of the 3706 Building, just west of Door #06.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

End Date: 

Description: The site is a french drain that received steam condensate. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

The drain has a concrete base and is covered by a 0.66 meter (2.17 feet) by 0.66 meter (2.17 feet) metal lid. The site is surrounded by gravel. An approximately 2.5 centimeter (1 inch) diameter metal pipe extends from the north wall of the courtyard, makes a 90 degree turn and enters the ground approximately 0.5 meters (1.6 feet) from the site. This pipe has had a section
removed from it. The area between the site and the north wall of the courtyard appears to be discolored by rust. The "Inventory of Miscellaneous Streams," Revision 3, lists the site as inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is located in the eastern courtyard of the 3706 Building. It is located along the north wall of the courtyard, approximately 13 meters (42.7 feet) west of the northeast corner.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Names: 300-139; 3706 Building Steam Condensate; Miscellaneous Stream #357
Type: French Drain
Status: Inactive

Description: Nineteen recognized miscellaneous stream drains were located within the boundary of the 3706 waste site and have been consolidated with 300-46. The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.77 meter (2.53 foot) diameter metal lid. The lid has perforations in it. The 3706 Building has been demolished. The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area.

Location: The site is located in the middle courtyard of the 3706 Building. It is approximately 3 meters (9.8 feet) from the northeast corner of the courtyard.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Names: 300-140; 3706 Building Steam Condensate; Miscellaneous Stream #356

Type: French Drain
Status: Inactive
Start Date: 300-140
End Date: 300-140

Description: The site is a french drain that received steam condensate. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

The drain is a concrete structure with the inner dimensions of 0.82 meters (2.69 feet) by 0.60 meters (1.97 feet) and is covered by a metal grate. The drain abuts the north wall of the 3706 Building. A second concrete structure abuts the drain to the north. This second structure is covered by a 0.66 meter (2.17 feet) by 0.66 meter (2.17 feet) metal lid. An approximately 10 centimeter (4 inch) diameter opening is visible on the north side of the drain, almost 0.6 meters (2 feet) from its top. Access to the process sewer is approximately 3.5 meters (11.5 feet) to the northeast of the site. It appears as though the drain received fire sprinkler system water in addition to steam condensate. Four metal pipes terminate open-ended over the drain's grate. An approximately 6 centimeter (2.4 inch) pipe extends from the north side of the 3706 Building 0.95 meters (3.1 feet) above the ground surface; an approximately 4 centimeter (1.6 inch) pipe extends from the building 0.6 meters (2 feet) above the ground surface; an approximately 2 centimeter (0.8 inch) pipe extends from the building 0.52 meters (1.7 feet) above the ground surface, and an approximately 3 centimeter (1.2 inch) pipe extends from the building 0.15 meters (0.5 feet) above the ground surface. All four pipes exit the building near a Fire Department Connection. The pipes entering the drain and the grate covering the drain appear to be discolored by rust. Approximately a meter to the east of the site, what appears to be an approximately 15 centimeter (5.9 inch) diameter steel pipe enters the ground. The lower 1.2 meters (3.9 feet) of this pipe appear to be of newer construction than the upper section; the upper section has rust marks from the wires that encircle it while the lower section doesn't. During the November 18, 1998, walkdown, there was standing water in the drain. The surface of the water was approximately 0.6 meters (2 feet) from the top of the drain. There had not been any rainfall for almost 2 weeks at that time. According to John Remaize, the steam and fire water for the building are still active. There is a 30 centimeter (11.8 inches) diameter clay pipe 4.3 meters (14.1 feet) east of the site. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. The 3706 Building is posted "Fixed Contamination Area." The drain is within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is located on the north side of the 3706 Building, near the northeast corner. The site is just east of Door #05.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Description: The french drain has been excavated and removed. The waste site was a french drain that received steam condensate. The drain appeared to be a concrete pipe with a 0.91 meter (3 foot) metal lid at grade level; however, the site is well obscured by sand and gravel. During the October 26, 1998, walkdown, the metal lid appeared to be ajar. There are two steam pipes entering the ground approximately 3 meters (9.8 feet) west of the site. One of these pipes is approximately 7 centimeters (2.8 inches) in diameter and the other is approximately 8 centimeters (3.1 inches) in diameter. There is also a metal pipe extending from the south side of the building next to the site. This pipe terminates approximately 1.8 meters (5.9 feet) above the ground surface and has been plugged. This third pipe is approximately 5 centimeters (2 inches) in diameter. The site is surrounded by sand and gravel. The 3706 Building was posted "Fixed Contamination Area." The drain was within the footprint of WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the french drain is inactive, source abandoned. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site was located on the south side of the 3706 Building, approximately 4.5 meters (14.8 feet) east of Door #01.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building and WIDS sitecode 300-46.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<td>The french drain has been excavated and removed. The waste site was a french drain that received steam condensate. The drain was an open clay pipe that abuts the south wall of the 3706 Building and is surrounded by asphalt and sand. The inner diameter of the top 7 centimeters (2.8 inches) of the pipe is 0.55 meter (1.80 feet). Below the top 7 centimeters (2.8 inches), the inner diameter is reduced to 0.44 meters (1.4 feet). The top of the pipe rises approximately 0.35 meters (1.1 feet) above the ground surface. The bottom of the drain is covered by debris. The top of the debris is approximately 0.7 meters (2.3 feet) below the top of the pipe. No pipes are visible entering the drain. However, there are two approximately 2.5 centimeter (1 inch) holes drilled into the side of the pipe. The clay around these holes as well as the interior of the pipe appear to be rust stained. An approximately 3 centimeter (1.2 inches) metal pipe exits the building 0.6 meters (2 feet) above the ground surface, makes a 90 degree turn and enters the ground approximately 0.6 meters (2 feet) east of the drain. Further east, on the opposite side of a wall extension, there is an approximately 5 centimeter (2 inch) metal pipe that exits the building approximately 0.45 meter (1.5 feet) above the ground surface and enters the ground. This second pipe is approximately 1.8 meters (5.9 feet) from the site and approximately 1 meter (3.2 feet) from a second clay pipe. This second clay pipe is approximately 0.75 meters (2.5 feet) in diameter. According to the &quot;Inventory of Miscellaneous Streams,&quot; Revision 3, the site is inactive, source abandoned. The 3706 Building is posted &quot;Fixed Contamination Area.&quot; The drain was within the footprint of the WIDS Site 300-46, which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.</td>

**Type:** French Drain  
**Status:** Inactive  
**Description:** The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.85 meter (2.79 foot) diameter metal lid. The top of the clay pipe is approximately 0.3 meters (1 foot) above the ground surface. The lid has an opening allowing pipes to enter the drain. An approximately 2.5 centimeter (1 inch) metal pipe and an approximately 1.3 centimeter (0.5 inch) diameter clear, plastic hose enter the drain through this opening. The plastic hose is attached to what appears to be a steam line extending through an old window or other former opening in the west wall of the courtyard. This opening is 2 to 3 meters (6.6 to 9.8 feet) north of the site and is currently boarded up. An approximately 5 centimeter (2 inch) diameter metal pipe exits the west wall of the courtyard, makes a 90 degree turn and enters the ground near the pipe. The clay pipe is broken, making removal of the lid unsafe. During the November 11, 1998, walkdown, the interior appeared dry when viewed through a break in the clay pipe. The site is surrounded by sand. The site falls within WIDS Site 300-46 which estimates the extent of...
extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

**Location:**
The site is located in the middle courtyard of the 3706 Building. It is approximately 8.5 meters (27.9 feet) north of the south entrance to the courtyard, abutting the west wall.

**Release Description:**
There were no known hazardous or radioactive releases from this steam condensate discharge.

**Related Sites/Structures:**
The site is associated with the 3706 Building.

**Process Description:**
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

The site is a french drain that received steam condensate. The drain is a clay pipe covered by a 0.78 meter (2.56 foot) metal cover. The lid is posted "Confined Space." The lip of the pipe is broken on its northeast side; this could allow stormwater runoff to enter. "FD 25" is written on the wall of the 3706 Building above the site. A metal pipe approximately 2.5 centimeters (1 inch) in diameter extends from the west side of 3706 just south of the site. This pipe exits the building approximately 3 meters (10 feet) above the ground surface and terminates approximately 15 centimeters (5.9 inches) after leaving the building. It was difficult to ascertain whether the pipe was plugged or not. The side of the building below this pipe appears to have rust stains. A second metal pipe approximately 2.5 centimeters (1 inch) in diameter extends from the south side of 3706, just around the corner from the site. This pipe leaves the building approximately 0.9 meters (3 feet) above the ground surface and disappears into the ground. The site is surrounded by soil and gravel. Moss is growing on the south side of the drain. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Nineteen drains were consolidated with 300-46.

**Location:**
The site is on the west wall of the 3706 Building, adjacent to the southwest corner.

**Release Description:**
There were no known hazardous or radioactive releases from this steam condensate discharge.

**Related Sites/Structures:**
The site is associated with the 3706 Building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-146
Names: 300-146; 3706 Building Stormwater Runoff; Miscellaneous Stream #364
Type: French Drain
Status: Inactive
Description: The site is a french drain that received stormwater runoff. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC). The drain is made of concrete and is covered by a 0.90 meter (2.95 foot) by 0.45 meter (1.48 foot) metal grate. An approximately 0.3 meter (1 foot) diameter metal pipe enters the east side of the drain. The site is surrounded by gravel and weeds. During the November 11, 1998, walkdown, standing water was visible through the grate; it had rained over the past week. The standing water made it difficult to estimate the depth of the drain, but it appears to be at least 0.9 meters (3 feet) deep. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Twenty recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is located in the eastern courtyard of the 3706 Building. It is located approximately 8 meters (26.2 feet) from the western wall, near the center of the courtyard.

Release Description: There were no known hazardous or radioactive releases from this water discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Names: 300-46; Soil Contamination and French Drains Surrounding 3706 Building

Reclassification: Consolidated (1/19/1999)

Code: 300-148
Names: 300-148; 3706 Building Stormwater Runoff; Injection Well #22; Miscellaneous Stream #359
Type: French Drain
Status: Inactive

Description: The site is described by the "Inventory of Miscellaneous Streams," Revision 3, as a french drain that collects stormwater runoff. The drain is an uncovered concrete pipe with an outer diameter of 0.9 meters (2.95 feet). The top of the pipe is flush with the ground surface on its southeast side while the northwest side is 7 centimeters (2.8 inches) above grade. The pipe appears to be filled with gravel and large rocks to within centimeters of its top. The drain is surrounded by gravel and soil. There is no evidence of a roof drain at this site. A 2.5 centimeter (1 inch) diameter metal pipe exits the west side of the building approximately 1.8 meters (5.9 feet) above the ground surface, makes a 90 degree turn towards the ground and terminates open-ended approximately 0.75 meters (2.5 feet) above the ground. The side of the drain closest to the 3706 Building, the gravel and rock between the building and the drain, as well as the side of the 3706 Building adjacent to the site all appear to be discolored by rust. The 3706 Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46.

Location: The site is located just west of the northwest corner of the 3706 Building.

Release Description: There were no known hazardous or radioactive releases from this water discharge.
Related Sites/ Structures: The site is associated with the 3706 Building.

This Site Was Consolidated With:
Code: 300-46
Names: 300-46; Soil Contamination and French Drains Surrounding 3706 Building

![Classification: Accepted](https://example.com)

Reclassification: Consolidated (1/19/1999)
Codes: 300-149; 3706A Building Steam Condensate; Injection Well #28; Miscellaneous Stream #432
Start Date: 300-150
End Date: 300-150
Names: 300-150; 3706 Building Steam Condensate; Miscellaneous Stream #430
Classification: Accepted
Reclassification: Rejected (12/15/1998)

Description: The site is a french drain that received steam condensate. The french drain is a concrete pipe covered with a 0.88 meter (2.89 foot) perforated metal lid. The lid is posted "Confined Space." The top of the pipe is 5 to 9 centimeters (2 to 3.5 inches) above the ground surface. A steam pipe enters the ground approximately 0.4 meters (1.31 feet) south of the site. The pipe is labeled "HPD-TRP-024" and "HPD-TRP-025." A 2.5 centimeter (1 inch) metal pipe is visible under the cover; it extends approximately 20 centimeters (7.9 inches) from the side of the concrete pipe and is in line with the steam pipe. The concrete pipe is 0.98 meters (3.2 feet) in length. The space below the concrete pipe appears to be filled with rocks and cobbles. During the October 27, 1998, walkdown, there was no evidence that the site was in use. The site is surrounded by asphalt, soil and gravel. The 3706A Building is posted "Fixed Contamination Area." The site falls within WIDS Site 300-46 which estimates the extent of extensive uranium, transuranic and chemical contamination of the 3706 Building and the surrounding area. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Nineteen recognized miscellaneous stream drains were located within the boundary of the waste site and have been consolidated with 300-46. This structure was not excavated because it was in close proximity to an active well (well number 399-6-5).

Location: The site is 7.5 meters (24.6 feet) east of the 3706A east entrance door, under the overhead steam line.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/ Structures: The site is associated with the 300 Area main steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

This Site Was Consolidated With:
Code: 300-46
Names: 300-46; Soil Contamination and French Drains Surrounding 3706 Building

Related Sites/ Structures: The site is associated with the 300 Area main steam line.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.
Type: French Drain
Status: Inactive
Description: The site was a french drain that is a clay pipe. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 1/5/2013. The outer diameter of the pipe is 1.25 meters (4.10 feet). The pipe had been covered by a metal lid which is labeled "Danger - Confined Space." The upper lip of the pipe was breaking up. The top of the pipe is flush with the ground surface for approximately one half of its circumference. The other half is 1 to 2 centimeters (0.4 to 0.8 inches) above the ground. The pipe was surrounded by soil and gravel. A pipe from the overhead steam line enters the ground nearby. This pipe is labeled "HPD-TRP-021." According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned. Because of the broken lip on the pipe, the site may have collected stormwater from the roadway.

Location: The site is located across Apple Street from the westernmost entrance on the north side of the 3706 Building. It is under the overhead steam lines.

Release Description: There were no known hazardous or radioactive releases from this steam condensate discharge.

Related Sites/Structures: The site is associated with the 3706 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). Type: French Drain
Start Date: 
End Date: 
Status: Inactive
Description: Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 1/5/2013. The site was a french drain that is a clay pipe 0.86 meters (2.82 feet) in diameter. The pipe was surrounded by asphalt and cobbles. The drain had an inset metal lid. A small diameter (approximately 2.5 centimeters or 1 inch) metal pipe enters the lid through an opening. Water was observed through this opening on a 10/13/98 visit to the site. At the time of the walkdown, the site was surrounded by a metal barricade. The label "HDP-TRP-009" mentioned in the "Inventory of Miscellaneous Streams," Revision 3, was not observed. The former location of the 3707B Building is currently home to electrical equipment and a Johnson Controls, Inc., air compressor. The "Inventory of Miscellaneous Streams," Revision 3, states that this site previously received steam condensate from the main steam line at pit U57 (300-152, stream #326), but now receives condensate from a Johnson Controls, Inc. air compressor.

Location: The site is located just north of the previous location of the 3707B Building. It is south of the two entry doors on the south side of the 3708 Building.
### Process Description:
Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

### Related Sites/Structures:
Previously, the site was associated with the 3707B Building, which has been demolished. The site is currently associated with a Johnson Controls, Inc., air compressor.

Description: The site is not an engineered structure. No pipe or lid was evident during the 10/13/98 walkdown. The ground surface is covered with soil and gravel. A pipe descending from the overhead steam line discharged directly onto the ground. At the time of the walkdown, the site was not labeled "HPD-V-015C" as described in the "Inventory of Miscellaneous Streams," Revision 3. However, the site is below a valve labeled "MSS-V-015." A small, shallow natural depression was observed just southwest of the discharge point. Stormwater runoff could collect in this depression. The former location of the 3707B Building is currently home to electrical equipment and a Johnson Controls, Inc., air compressor. The "Inventory of Miscellaneous Streams," Revision 3, says the site is inactive, source abandoned.

Location: The site is located at the northwest corner of the intersection of Apple St. and Wisconsin Street. It is below an overhead steam line.

Related Sites/Structures: The site is associated with the 3707B Building, which has been demolished.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. **Reclassification:** Rejected (12/15/1998)
**Type:** French Drain
**Start Date:**
**End Date:** 1/1/1996
**Status:** Inactive
**Description:** The site is a french drain covered by a 1.1 meter (3.61 foot) metal lid. The lid is labeled "Confined Space." The drain itself appears to be approximately half the diameter of the lid. Because of the size difference between the lid and the drain, it was difficult to get a good look inside the drain. The upper part of the drain appears to be made of bricks. The site is surrounded by gravel. A manhole labeled "Caution, Radioactive Material, Internally Contaminated" is approximately 2 meters (6.6 feet) to the northwest. This manhole is related to the 300 Area Process Sewer System (WIDS Site 300-15). According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive.

**Location:** The site is located approximately 4 meters (13 feet) northwest of the northwest corner of the 3706 Building, and approximately 2 meters (6.6 feet) southeast of a manhole labeled "Radioactive Material, Internally Contaminated."

**Related Sites/Structures:** The site is associated with the 3707C Building, which has been demolished.

Hanford Site Waste Management Units Report
February 2015
Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 1/8/2013. It was a vitrified clay pipe buried vertically. The top was even with the ground surface and was covered with a metal lid. Two lines discharged into the drain.

Location: The site was located on the east side of the 3708 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Classification: Accepted
Reclassification: Rejected (12/15/1998)
Description: The waste site was a french drain that was removed during the demolition of the 3709 building. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 6/1/2012. It was a concrete pipe, covered by a 1.46 meter (4.79 foot) metal lid. The lid was labeled "Confined Space." The lid was not labeled "F.D. #3" as described by the "Inventory of Miscellaneous Streams," Revision 2. The lid was almost flush with the ground surface and is surrounded by asphalt. A metal pipe approximately 4 centimeters (1.6 inches) in diameter extended from the north side of the 3709 building and entered the ground approximately 1 meter (3.5 feet) from the edge of the drain.

Location: The site was located at the northeast corner of the 3709 building.

Related Sites/Structures: The site is associated with the 3709 building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. corner of the building where it drops towards the ground surface. This pipe terminates open-ended 0.20 meters (0.66 feet) above the ground surface.

During a November 1998 site inspection, the source of the steam condensate for this french drain came into question. Tracing out the lines, and verifying with drawing M-3901, Sheet 2, Revision 30, it was determined that the line into the french drain is actually a line from an abandoned helium system that ran between the 306 and 3712 Buildings. This line terminates open-ended. The drawing shows a gate valve to the atmosphere at the culvert on the east side of the building and at the northwest corner of 3712, plus a 2.5 centimeter (1 inch) gate valve near the center of the north side of 3712.

It is believed that this site was mistakenly included in the miscellaneous streams inventory, and that is was in fact a purge point for the helium system.

This site is located within a "Radiologically Controlled Area" posted around the 3712 Building. The 3712 Building is an active uranium metal storage unit, documented as WIDS Site 3712 USSA, and posted as "Caution Fissile Materials" and "Radiation Area and Contamination Area".

**Location:** The site is located on the east side of the 3712 Building, 16.3 meters (53.5 feet) south of the northeast corner.

**Related Sites/Structures:** The site is associated with the 3712 Building (WIDS Site 3712 USSA).

**Process Description:** Helium is a light noble gas. Releases of helium to the atmosphere would quickly dissipate with no expected reaction or contamination of the surrounding area.

**Code:** 300-170

**Names:** 300-170; 3712 Building Steam Condensate; Miscellaneous Stream #437

**Type:** French Drain

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Rejected (2/24/1999)

**Start Date:**

**End Date:**

**Description:** According to the "Inventory of Miscellaneous Streams," Revision 3, the site was a french drain that received steam condensate. The report identified the location as the north side of the 3712 Building directly next to the building. During the October 27, 1998 walkdown, a concrete pipe with a 1.0 meter (3.3 foot) metal lid was found at the top of a small slope approximately 13 meters (42.7 feet) northwest of the roll up door on the north side of 3712. The metal lid is not labeled. Based on previous experience with the location descriptions and coordinates in the "Inventory of Miscellaneous Streams," this structure seems to fit the description for this stream. The top of the concrete is above grade except where the surrounding cobbles are spilling over and partially covering the lid. Two metal pipes extend horizontally from the north side of 3712 Building 6 to 9 meters (20 to 30 feet) above the ground surface. One of these pipes appears to be capped; the other appears to be open-ended and approximately half the diameter of the capped pipe. Drawing M-3800, sheet 2, revision 20, shows a steam line running from approximately the center of the north side of the 3712 Building north to 3710A, which has since been demolished. A Johnson Controls, Inc., boiler house has been built north of the northeast corner of 3712. During the October 27, 1998, walkdown, the lid could not be lifted in order to verify whether or not this stream is still active. Another walkdown was done on February 17, 1999 for the purpose of lifting the lid on the site and taking a photograph. There are no pipes visible inside the drain. There is no evidence the drain is active. The concrete pipe is filled with large rocks to within a few inches below the metal cover. Nat Harden, DynCorp Electrical System Specialist was visited. He looked through the available service drawings for the...
location. Nat stated that he was fairly sure that this waste site was the french drain for the steam condensate from the 3710A Building (now demolished). He said that the 3710A Building steam supply was an overhead line that ran from the north side of the 3712 Building. Nat noticed that the steam line is shown as dashed (denoting an underground) line on the as-built drawings whereas it should be shown as an above ground line that has been removed. The waste site is not shown on any of the utility drawings that Nat had.

**Location:**

The site is located approximately 13 meters (42.7 feet) northwest of the roll up door on the north side of 3712, at the top of a small slope. If the 3710A Building was still in place, this french drain would be located west of this Building.

**Related Sites/Structures:**

The site is associated with the 3712 or 3710A Building.

**Process Description:**

Steam was produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, it was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

**Code:** 300-171

**Classification:** Accepted

**Names:** 300-171; 3713 Building Steam Condensate and Stormwater Runoff; F.D. #7; Miscellaneous Stream #333

**Reclassification:** Rejected (12/15/1998)

**Type:** French Drain

**Status:** Inactive

**Description:** The waste site was a french drain received only stormwater. It was removed and sealed with grout during the demolition of the 3713 building. It was a clay pipe covered by a 0.32 meter (1.05 foot) perorated metal lid. The lid was not labeled F.D. #7 as described in the "Inventory of Miscellaneous Streams," Revision 2. The top of the drain was flush with the ground surface. The drain appeared to be filled with soil to within 30 centimeters (11.8 inches) of the top of the pipe. The site was surrounded by soil and gravel. Soil was subsiding around the drain (see photos). According to the "Inventory of Miscellaneous Streams," Revision 3, the steam source has been shut off.

**Location:** The site was located at the northwest corner of the 3713 Building.

**Related Sites/Structures:**

The site is associated with the 3713 Building.

**Process Description:**

Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Description:** The waste site was an injection well that was grouted in 2006, but not removed during the demolition of the 3713 building. No engineered structure was evident. It was a slightly depressed area, approximately 0.4 meters (1.31 feet) in diameter, filled with cobbles and larger rocks. Stormwater runoff may have collected in this depression. The site was surrounded by soil and gravel. A pipe from the overhead steam line labeled "HPD-TRP-018" entered the ground just north of the site.

**Location:** The site was 8.9 meters (29.2 feet) southwest of the southwest corner of the 3713 building.

**Related Sites/Structures:** The site is associated with the 3713 building.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

### Type: French Drain

**Status:** Inactive

**Description:** The waste site was an injection well that was removed during the demolition of the 3713 building. It was sealed with grout in January 2006. It was covered by a 0.94 meter (3.08 foot) metal lid. A small diameter, 2.5 centimeters (1 inch) diameter metal pipe extended from the building to the drain's lid. The pipe extended from the building approximately 1.75 meters (5.7 feet) above the ground surface, then turned 90 degrees and extended within 0.25 meters (9.8 inches) of the ground surface.

**Location:** The site was located on the east side of the 3713 Building, 8.7 meters (28.5 feet) south of the northeast corner.

**Related Sites/Structures:** The site is associated with the 3713 Building.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. ### Type: Valve Pit

**Status:** Inactive

**Description:** The drain was decommissioned in 2012. The site was a rectangular valve pit with a dirt floor. Steam condensate was discharged onto the floor of the pit. The top of the concrete base is 5 to 15 centimeters (1.97 to 5.91 inches) above grade. The valve pit is covered by a metal lid 1.30 meters (4.27 feet) by 1.11 meters (3.64 feet). The lid is labeled "Confined Space" and "U-49." A steam pipe from the overhead line enters the ground just east of the site. The pipe is labeled "HPD-TRP-005." The site is surrounded by sand and asphalt.

**Location:** The site is located between the 3715 Building and the 303E Building, under the overhead steam line.

**Related Sites/Structures:** This site is associated with the 3715 Building.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

*Hanford Site Waste Management Units Report*

February 2015
Type: Injection/Reverse Well
Status: Inactive
Start Date: 1/1/1998
End Date: 1/1/1998

Description: The site was an injection well that received steam condensate. It was sealed with grout in January 2006. The site was a 90 centimeter (2.95 foot) diameter, concrete structure with a perforated metal cover. It was located adjacent to an overhead steam line, but there was no visible evidence of a steam pipe connecting to this drain. The drain was in a slight depression from the surrounding grade.

Location: The site was located approximately 5 meters (16.5 feet) from the southeast corner of the 3717 Building.

Related Sites/Structures: The site is associated with the 3717 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

Code: 300-178
Names: 300-178; 3717 Building Steam Condensate; Miscellaneous Stream #329

Description: The site was a french drain constructed of clay pipe. It was sealed with grout in 2006. The top of the clay pipe was 5 centimeters (2 inches) above grade. The drain appeared to have been filled with sand or soil to within 0.35 meters (1.15 feet) of the top of the pipe. The drain was covered by a 0.25 meter (0.82 foot) metal lid with perforations. There was no evidence of use observed during the 10/08/98 walkdown. The site was surrounded by soil and gravel.

Location: The site was located just east of the south entry door to the 3717 Building.

Related Sites/Structures: The site is associated with the 3717 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

---

Code: 300-179
Names: 300-179; 3717 Building Steam Condensate; Miscellaneous Stream #324

Description: The site was a french drain constructed of clay pipe. It was sealed with grout in 2006. The top of the clay pipe was 5 centimeters (2 inches) above grade. The drain appeared to have been filled with sand or soil to within 0.35 meters (1.15 feet) of the top of the pipe. The drain was covered by a 0.25 meter (0.82 foot) metal lid with perforations. There was no evidence of use observed during the 10/08/98 walkdown. The site was surrounded by soil and gravel.

Location: The site was located just east of the south entry door to the 3717 Building.

Related Sites/Structures: The site is associated with the 3717 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.
**Description:** The site was a french drain constructed of clay pipe. It was sealed with grout in 2006. The upper lip on half of the pipe was broken, so the 0.39 meter (1.28 foot) metal lid did not seat properly. During the 10/8/98 walkdown, the site was surrounded by a metal safety barricade. During the same walkdown, it was observed that the pipe that descended from the overhead steam line was not labeled. The "Inventory of Miscellaneous Streams," Revision 3, states "HPD-TRP-022" is the steam trap associated with this french drain. The broken lip may allow stormwater runoff to enter this drain. The site is surrounded by soil and gravel.

**Location:** The site is located south of the southwest corner of 3717.

**Related Sites/Structures:** The site is associated with the 3717 Building.

**Process Description:** Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-182
Names: 300-182; 3717B Building Steam Condensate; Miscellaneous Stream #323
Type: French Drain
Status: Inactive
Description: The site was a French drain with a square concrete base. The top of the structure was removed in 2006 and backfilled. The top of the base ranges from approximately 1 centimeter (0.4 inches) to 5 centimeters (2 inches) above grade. The drain was covered by a 0.66 meter (2.17 foot) by 0.66 meter (2.17 foot) square metal lid. The lid had a "Confined Space" label. The site was surrounded by gravel where it did not abut 3717B. Two pipes from the overhead steam line entered through the lid. A row of "Radiologically Controlled Area" signs ran east to west approximately 5 meters (16.4 feet) north of the site. Although the ground between 3717B and 304 was fairly level, there appeared to be enough of a slope to prevent water flowing from the 304 Building towards the site.
Location: The site was adjacent to the north side of the 3717B Building and south of the 304 Building.
Related Sites/Structures: The site is associated with the 3717B Building.

Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-183
Names: 300-183; 3718 Building Steam Condensate; F.D. #40; Miscellaneous Stream #340
Type: French Drain
Status: Inactive
Description: In April 2009, 300-183 was filled with dirt and the top three feet of the structure was removed to satisfy requirements of WAC 173-218. The site was a French drain that received steam condensate.
Location: The site was located southeast of the southwest corner of the 3718 Building.
Related Sites/Structures: The site is associated with the 3718 Building.
**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<td><strong>Description:</strong></td>
<td>Twin 10-centimeter (4-inch) galvanized pipes drain each of two roofs that slope into each other in the center of the building. The pipes are joined about 0.7 meters (2 feet) above the ground in a Y, and empty into a 14-centimeter (6-inch) PVC pipe. This pipe travels just under the ground surface for about 12.2 meters (40 feet) and exits from a railroad tie retaining wall. The stormwater then spills onto the ground between the road and retaining wall. The soils are very sandy and the water probably infiltrates without overland flow. While the miscellaneous streams report (Rev. 3) says that it is an injection well, there is no injection well. The stormwater runoff ultimately empties into a &quot;non-engineered structure&quot; (the bare ground).</td>

Names: 300-188; 3730 Building Steam Condensate; Miscellaneous Stream #420
Type: French Drain
Status: Inactive
Classification: Accepted
Recategorization: Rejected (9/2/1998)
Description: The site is covered by a rusted steel plate, 0.84 meters (2.75 feet) in diameter, and with a 10.2 centimeter (4 inch) diameter asbestos-free insulated steam pipe running into the northeast part of plate. Four 2.54 centimeter (1 inch) diameter holes are cut into the plate. A label on top of the plate reads "DANGER LIMITED ACCESS/CONFINED SPACE, ENTRY BY PERMIT ONLY."
Location: The site is located on the northwest side of the 3730 Building, 0.76 meters (2.5 feet) west of the building, and 7.47 meters (24.5 feet) south of the northwest corner of the building.
Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-189
Names: 300-189; 3731 Building Steam Condensate; Miscellaneous Stream #269
Type: French Drain
Status: Inactive
Classification: Accepted
Recategorization: Rejected (9/2/1998)
Description: A site walkdown done in 1998 originally described a french drain that is a 10 centimeter (4 inch) metal pipe that extended through the asphalt. The pipe was about 0.75 meters (2.5 feet) deep and extended from the top half of the building, about 0.6 meters (2 feet) south of a swamp cooler. The "Inventory of Miscellaneous Streams", Revision 3, says the stream is active, but in 1998, the building was posted as closed, and the drain was dry at the bottom. Additional research of Miscellaneous Stream #269 (300-189) was conducted in May 2012 in order to plan for removal/closure activities. As the specific drywell location is undetermined, the coordinates have been adjusted to the estimated inlet 300-293:1 pipe location (E594130.9/N116021.4).
Location: The french drain is located in the center of the east wall of the 3731 Building, about 5 centimeters (2 inches) from the wall. As the specific drywell location is undetermined, the coordinates have been adjusted to the estimated inlet 300-293:1 pipe location (E594130.9/N116021.4).
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to...
produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<tr>
<td>Description:</td>
<td>A 1998 site walkdown originally described 17.8 centimeter (7 inch) PVC pipe that extended through the asphalt paving against the 3731 Building. The drain receives only stormwater from the roof of the 3731 Building, which was a closed facility. The downspout was almost the same diameter as the french drain, so the depth was not determined. The french drain pipe was cracked. Additional research of Miscellaneous Stream #517 (300-190) was conducted in May 2012 in order to plan for removal/closure activities. No information was discovered pertaining to the exact location or construction of the drywell.</td>
<td>Location:</td>
<td>The drain location is in the northeast corner of the 3731 Building, immediately adjacent to the corner. A review of construction drawing H-3-17451 depicts the down spout locations for the 3731 building stormwater run-off which is the source to 300-190. The down spout locations from drawing H-3-17451 match the location depicted in the WIDS database photos for 300-190. As the specific drywell location is undetermined, the coordinates have been adjusted to the estimated downspout location (E594130/N116033.4.). No feature was visible at the previously mapped site. The estimated inlet pipe coordinates correlate with the location of the WIDS site 300-293:1 pipeline segment. The 9.5 meter long pipeline segment is a 4 inch diameter 2 foot below grade steel drain pipe from reference drawing H-3-300042 sheet 7. The correlation between the 300-190 inlet pipe material, size, and location with 300-293:1 drain pipe segment indicates a potential relationship. The mapped drywell location was adjusted to match the terminus end of the 300-293:1 pipe segment.</td>

construction drawing H-3-17451 depicts the down spout locations for the 3731 building stormwater run-off which is the source to 300-191. The down spout locations from drawing H-3-17451 match the location depicted in the WIDS database photos for 300-191. As the specific drywell location is undetermined, the coordinates have been adjusted to the estimated downspout location (E594130.5/N116008.2.). No feature was visible at the previously mapped site.

The estimated inlet pipe coordinates correlate with the location of the WIDS site 300-293:1 pipeline segment. The 9.5 meter long pipeline segment is a 4 inch diameter 2 foot below grade steel drain pipe from reference drawing H-3-300042 sheet 7. The correlation between the 300-191 inlet pipe material, size, and location with 300-293:1 drain pipe segment indicates a potential relationship. The mapped drywell location was adjusted to match the terminus end of the 200-293:1 pipe segment.

**Process Description:**

The site received only stormwater runoff from the roof.

---

**Code:** 300-192  
**Classification:** Accepted  
**Names:** 300-192; 3732 Building Steam Condensate; Miscellaneous Stream #349  
**Reclassification:** Rejected (12/15/1998)  
**Type:** French Drain  
**Status:** Inactive  
**Start Date:** 1/1/1997  
**End Date:**  
**Description:** The drain was decommissioned in 2012. The site was a french drain that received steam condensate from a quench tank. The drain appeared to be made of concrete and is covered by a lid. The foundation of the 3732 Building had been posted "Fixed Contamination Area." Details of this drain have been obscured by the paint applied for this posting. The outer perimeter of the drain measures 1.2 meters (3.9 feet) by 1.2 meters (3.9 feet) and rises approximately 10 centimeters (3.9 inches) above grade. The lid measures 0.98 meters (3.22 feet) by 0.98 meters (3.22 feet). Where the edges of the lid are visible, it appears as though it has been sealed by the paint. A sign on the lid has been obscured by paint. The site is surrounded by gravel. While visiting an adjacent site on 11/2/98, it was noticed that the 3732 pad had been surrounded by post and chain since the previous walkdown. The barricade was labeled "Radiological Buffer Area" and "Radiologically Controlled Area."

**Location:** The site is located at the southwest corner of the 3732 foundation.

**Related Sites/Structures:** This site is associated with the 3732 Building. All that remains of the 3732 Building is the foundation (300-245). The site is also associated with the soil contamination under the remaining foundation (300-48).

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

### Type: French Drain  
**Start Date:**

**Status:** Inactive  
**End Date:** 1/1/1997

**Description:** The drain was decommissioned in 2012. The site was a french drain that received steam condensate. The drain was a concrete pipe which rises approximately 5 centimeters (1.97 inches) above grade. The pipe was covered by a 0.98 meter (3.22 foot) metal lid. The foundation of the 3732 Building had been posted "Fixed Contamination Area." The roof of the adjacent 303B Building is posted "Contamination Area." The site is surrounded by gravel.

**Location:** The site is southwest of the northwest corner of 3732. It is located between the 3732 foundation and the 303B Building.

**Related Sites/Structures:** The site is associated with the 3732 Building. All that remains of 3732 is the foundation (300-245). The site is also associated with the soil contamination remaining under the foundation (300-48).

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

### Code: 300-194  
**Classification:** Accepted

**Names:** 300-194; 3734 Building Steam Condensate; F.D. #8; Miscellaneous Stream #334

### Type: French Drain  
**Start Date:**

**Status:** Inactive  
**End Date:** 1/1/1997

**Description:** The site is a french drain. The site is associated with the 3734 Building, which has been demolished. The 3734 Building's concrete pad is still in place and is surrounded by soil and gravel. There are two small areas of Fixed Contamination adjacent to the pad. No drain was visible during the site walkdown.

**Location:** According to the "Inventory of Miscellaneous Streams," Revision 3, the site is associated with the 3734 Building. However, the coordinates provided by that document map the site just north of the former 3734A Building. Both buildings have been demolished and no drain was visible during the site walkdown, so it was not possible to ascertain the actual location of this site.

**Related Sites/Structures:** The site is associated with the 3734 Building, which has been demolished.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

*Hanford Site Waste Management Units Report*

February 2015  
1998
Type: French Drain
Status: Inactive

Description: The site is a french drain that received steam condensate. The previous location of the 3734A Building is currently a cobble-covered area on the east side of the 3705 Building. No drain was visible during the site walkdown.

Location: According to the "Inventory of Miscellaneous Streams," Revision 3, the site is on the south side of the 3734A Building.

Related Sites/Structures: The site is associated with the 3734A Building, which has been demolished.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-196
Names: 300-196; 3745 Building Steam Condensate; Miscellaneous Stream #399

Type: Sump
Status: Inactive

Description: The drain was decommissioned in 2012. The site was a condensate sump constructed of concrete, 96.5 centimeters square (38 inches square), with a 66 centimeter (26 inch) diameter access cover.

Location: The site is located 10.7 meters (35 feet) south of the 3745 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-197
Names: 300-197; 3745 Building Steam Condensate; Injection Well #5; Miscellaneous Stream #398

Type: Injection/Reverse Well
Status: Inactive

Description: Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 4/1/2012. The site was covered with a 147.3 centimeter (58 inch) diameter steel cover. Two pipes exited the 3745 Building and entered the drain. One of the pipes appeared to be condensate from steam and the other pipe is unknown.

Location: The site is located adjacent to the east side of the 3745 Building, just north of the east door.
Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-198
Names: 300-198; 3745 Building Steam Condensate; Injection Well #1, Miscellaneous Stream #397
Type: French Drain
Status: Inactive
Description:
Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 4/1/2012. The site was a vertical vitrified clay pipe with a steel lid. An eye bolt was fastened to the center of the lid. The cover should be removed to confirm the function of the site.

Location: The site is located just off the northeast corner of the 3745 Building.

Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-199
Names: 300-199; 3745A Building Steam Condensate; Miscellaneous Stream #380
Type: French Drain
Status: Inactive
Description:
The Miscellaneous Stream site is a 0.6 meter by 0.45 meter (2 foot by 1.5 foot) rectangular concrete pit with a perforated steel cover. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

About 15 centimeters (6 inches) from the top, a 10 centimeter (4 inch) pipe enters from the direction of the 3745A Building. The drain is at least 0.6 meters (2 feet) deep, with the bottom 15 centimeters full of water. The site will also act as a storm drain for the surrounding compacted graveled area and the nearby roof runoff drain spout. The drain was protected by a yellow steel pipe barricade. The "Inventory of Miscellaneous Streams", Revision 3 lists this stream as eliminated. The lines have been capped. The source has been routed to the process sewer. The 3745A building has been demolished. The drain is no longer visible.

Location: The unit is west of the 3745A Building, 3.5 meters (11.5 feet) northwest of the northwest corner and roof downspout.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-200
Names: 300-200; 3745B Building Steam Condensate; Miscellaneous Stream #379
Type: French Drain
Status: Inactive
Description: The waste site was removed during the demolition of the 3745A and B buildings. It was a square concrete pit, measuring 1.2 meters (4 feet) on a side, covered with a solid steel plate. The site appeared to be about 1 meter (3 feet) deep, with the bottom covered in water. A 10-centimeter (4-inch) iron pipe entered from the south side (from the 3745B Building) and another 10-centimeter (4-inch) pipe was lower, on the west side of the drain, barely extending into the drain. The "Inventory of Miscellaneous Streams", Revision 3 says the stream is eliminated. The pipes were capped. The source was routed to the process sewer. The water in the bottom was probably residual, as there was no air circulation to evaporate the water.

Location: The unit was located on the north side of the 3745B Building, 1.8 meters (6 feet) north of the north wall, and 9 meters (30 feet) west of the northeast corner.

Process Description: The "Inventory of Miscellaneous Streams", Revision 3, lists the site as inactive, source eliminated. The source has been routed to the process sewer. This site received steam condensate only. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-201
Names: 300-201; 3762 Building Steam Condensate; Injection Well #42; Miscellaneous Stream #491
Type: French Drain
Status: Inactive
Description: The site is a 1 meter (3 foot) diameter concrete pipe in the gravel roadway. A 5 centimeter (2 inch) steel pipe comes in at the bottom, from the direction of the 3762 Building. The bottom of the drain is 0.5 meters (1.5 feet) deep, and covered with small rocks and sand. The drain is protected by a yellow steel barrier made of pipes, which has been bent by traffic over the years. The drain is covered by a galvanized steel plate with 4 vent holes. The "Inventory of Miscellaneous Streams", Revision 3, says the site is active. However, the 3762 Building is posted as a closed facility, and most (or all) of the old steam lines in the area have been abandoned, so the site may actually be inactive. The site status has been changed to inactive to reflect information provided by the responsible contractor.

Location: The site is located 5.3 meters (17.5 feet) east of the northeast corner of the 3762 Building.
### Process Description:
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

<td>Demolition of the above and below-grade 3790 structures was completed in April, 2014 (CCN-176194). Rejected storm water Underground Injection Control well Miscellaneous Stream #375 was decommissioned during demolition of 3790 structures. The site was a french drain constructed of concrete pipe and covered with a 1.15 meter (3.77 foot) steel lid. The lid was labeled &quot;FD 16&quot; and &quot;Confined Space.&quot; This french drain was surrounded by cobbles. A roof drain pipe was visible near the french drain. Two metal pipes extending from the side of the building were also observed. A metal pipe approximately 1.83 meters (6 feet) in length runs parallel to the ground surface, approximately 0.3 meters (1 foot) above the surface. This pipe was part of the fire water test system. A small diameter, short, metal pipe elbow also extended from the building at the same level as the fire water test pipe.</td>

The drain was decommissioned along with the demolition of the 382 complex in 2012. The site was a French drain that received steam condensate. The drain is a clay pipe with a 1.12 meter (3.67 foot) metal lid. In April 2012, the drain was filled with grout. The top of the clay pipe is visible a few centimeters above grade. The lid had three holes cut into it and is labeled "Confined Space." A metal pipe, approximately 2.5 centimeters (1 inch) in diameter, was labeled "LPD-TRP-016" and entered the drain through one of the holes in the metal cover. During a site walkdown in 1997, steam could be seen rising from the drain and the sound of a liquid being discharged into the drain could be heard.

Location: The site is located at the northwest corner of the north wing of the 382 Building.

Related Sites/Structures: The site is associated with the 382 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-212
Names: 300-212; Miscellaneous Stream #400; MO010 Building Steam Condensate Sump
Type: French Drain
Status: Inactive
Description: The site is a 121.9 centimeter (48 inch) condensate sump, constructed of concrete and covered with a steel plate. There are no postings.
Location: The site is located 7.6 meters (25 feet) south of the 3745 TRL-3 (M0-010) Building.
Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-213
Names: 300-213; Miscellaneous Stream #332; West High Tank (Water Tower) Overflow and Steam Condensate
Type: French Drain
Status: Inactive
Description: The site is a French drain that received steam condensate and overflow from a water tower. The drain has a square concrete base covered by two metal grates. The concrete base is approximately 1 meter (3.3 feet) deep. At the bottom of this reservoir is an opening approximately 11 centimeters (4.3 inches) in diameter. Inside the reservoir is a square metal
plate held at an angle by two metal rods extending through the grates. Without this support, it appears as though the metal sheet would lay flat at the bottom of the reservoir and block the outlet pipe at the bottom. A metal pipe approximately 11 centimeters (4.3 inches) in diameter extends from the top of the water tower to just above the grates. Three pipes enter the northeast side of the reservoir approximately 0.4 meters (1.31 feet) from its top. The pipes terminate open-ended inside the reservoir. The site is surrounded by sand and cobbles.

Location: The site is located next to the southwest leg of the water tower south of the 3711 Building.

Related Sites/Structures: The site is associated with the water tower south of the 3711 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Code: 300-215
Names: 300-215; 300 Area South
Type: Dumping Area
Status: Inactive
Description: The site is very large and includes many different features. Much of the site is covered with vegetation such as cheatgrass and sagebrush. Two major roads cross the site: George Washington Way Extension and George Washington Way to Stevens Drive. Many old road traces exist and one major gravel road bisects the site. A gravel pit, and construction materials dumping ground are located in the north section of the site, south of the 300 Area fence, and west of the George Washington Way extension. Vestiges of irrigation canals are found throughout the site. Groundwater monitoring wells are found throughout the site. There is also a drywell (purpose unknown) in the area. Recent debris includes windblown garbage and tumbleweeds. Some older material near an irrigation canal may pre-date Hanford (e.g. porcelain china, battery cores, cans, and glass). A large diameter buried water line installed in the early 1990's is present in the southern part of the site. Underground electrical, water, and telephone lines are present on the site.

Location: The location and areal extent of 300-215 encompasses Stevens Drive on the west, Horn Rapids Road on the South, the Columbia River on the east, and the southern 300 Area fence line on the north.

Code: 300-217
Names: 300-217; 300 Area Laydown Yard
Type: Storage
Status: Active
Description: The area is currently in use as a laydown area for construction materials. Construction materials observed at the site included Conex boxes, steel pipe, ladders, steel, plastic pipe, wood pallets, insulation material, and railroad ties. Several vehicles were also stored at the site. No wood utility poles were observed and no stains were observed on the soil from temporary storage of wood utility poles. Most material is stored off the ground on racks. An
electrical structure is located in the northwest part of the site. The numbers on the structure are: C3X483 on the west side, C3X481 on the north side, and C3-24 on the south side. Four access manholes are present south of the structure. Three of the manholes are 1.22 meters (4 feet) in diameter and the fourth is 0.91 meters (3 feet) in diameter. A 1.22-meter (4-foot) square concrete structure with a metal lid is present about 15.24 meters (50 feet) south of the north side fence. Well 399-04-01 is present on the northeast corner of the site. A minor amount of blown-in paper was observed. A large borrow pit is found south of the site.

**Location:** The site is located in the 300 Area, southwest of the intersection of Cypress and George Washington Way Extension.

**Code:** 300-220  
**Classification:** Not Accepted  
**Names:** 300-220; Gravel Pit #7; Pit 7  
**Reclassification:** None  
**Type:** Depression/Pit (nonspecific)  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The site is a manmade depression identified as Gravel Pit #7. The surface consists of sand and gravel with some cobbles, and a light vegetation cover of bunch grass and small sage. Trace fragments of concrete and asphalt can be found along the depression margins. Although it is included in the general radiologically controlled area north of the 300 Area, there are no site specific radiological postings.  
**Location:** Gravel pit #7 is located north of 300 Area, northeast of the railroad tracks.  
**Related Sites/Structures:** The pit is related to Aluminum Shavings Area (Site Code 300-8).

**Code:** 300-222  
**Classification:** Accepted  
**Names:** 300-222; 384-W Brine Pit; 384-W Salt Dissolving Pit and Brine Pump Pit  
**Reclassification:** Rejected (3/14/2002)  
**Type:** Sump  
**Start Date:** 1/1/1977  
**End Date:**  
**Description:** The brine pit, a concrete underground storage pit, was cleaned out and filled with sand/gravel in May 1998. At the surface the structure measures 5.18 meters (17 feet) by 3.05 meters (10 feet). It was divided into two sections. The larger section is the salt dissolving pit, also called "brine pit" on drawings. This section held the salt that was dissolved to make the brine. A 3.8 centimeter (1.5 inch) stainless steel sprinkler pipe runs the length of the pit. A 3.8 centimeter (1.5 inch) PVC (polyvinyl chloride) brine return line enters the pit through its south wall. The bottom of the pit was covered with a 15 centimeter (6 inch) layer of gravel topped by a 15 centimeter (6 inch) layer of sand. Three 2.9 meter (9.5 foot) lengths of 10 centimeter (4 inch) transite tile pipe were located within the gravel layer. These three pipes connected through a dividing wall into the adjacent section. An overflow drain is located near the top of the structure. The salt dissolving pit is identifiable at the surface by its red metal cover. The smaller section is the brine pump pit, also called "tank" in drawings. A 5 centimeter (2 inch) PVC line exits the pit through its south wall. The brine pump pit is identifiable at the surface by its gray metal cover.  
**Location:** The Brine Pit is located approximately 6 meters (20 feet) north of the west end of the 384 Powerhouse.
Process Description: The steam system used "soft" water. Water from the Water Filter Plant (315 Building) ran through a water softening process before going to the boilers. The brine was used to regenerate the ion exchange demineralizers in the water softeners. The brine was created by distributing raw water across the surface of the salt using the sprinkler pipe. As the water passed through the salt, the solution became saturated. The brine solution passed through the layers of sand and gravel which filtered out salt crystals and other particles. The filtered brine passed into the tile pipe and was discharged into the pump pit ready for use. Flow through the brine pit was achieved by the addition of new water into the salt dissolving pit and the removal of brine from the pump pit.

</tbody>
</table>

Description: The site has been remediated and Closed Out. The waste site was two, 16,000 gallon carbon steel, underground storage tanks, positioned horizontally, in a north-south direction. The site was backfilled on March 22, 2003 after the Day Tanks and surrounding contaminated soil had been removed.

Location: The centers of the day tanks were located north of the north wall of the 384 Powerhouse. Day Tank #1 was the east tank and Day Tank #2 was the west tank.

Related Sites/Structures: The Day Tanks were associated with the 384 Powerhouse (WIDS Site 300-26, Rejected), the 366/366A Fuel Oil Bunkers (WIDS Site 300-6, Interim Closed Out), UPR-300-7 (Closed Out) and UPR-300-42 (Interim Closed Out).

Process Description: Fuel oil was pumped into the Day Tanks from the larger fuel oil bunkers. A heater in the Day Tanks kept the oil temperature at 120 degrees Fahrenheit. The oil was used to fuel the 384 Powerhouse boilers to create steam.

Closure Info: The Remedial Action Report was issued in March 2000. The report describes the actions take to remove the petroleum contaminated soil and the two 16,000 gallon fuel tanks. On March 21, 1998, an offsite vendor removed the fuel from the 384 Fuel Bunker and associated day tanks. Some residual material remained in the tanks. In June of 1999, the tanks were removed, cleaned, and sold as scrap metal. A site assessment showed that diesel range organics and motor oils were found in almost all soil samples, and most were above the Model Toxics Control Act (MTCA) Method A cleanup levels of 200 milligrams per kilogram. Soils adjacent to the fill area of the tanks had the highest petroleum concentrations based on visual observations. No evidence of free product or petroleum saturated soil was found below the tanks. Visual inspection of the tanks indicated they were in good condition with no evidence of deterioration to the point that product would leak from them. The soil removed from the excavation was taken to Gravel Pit 9 for bioremediation (see 600-278). In September 1999, five verification samples were collected from the tank excavation and analyzed. The day tank excavation was backfilled to grade in March 2003.

Approximately 600 cubic meters of contaminated soil was removed from the site and taken to Pit 9 on the Hanford Site for bioremediation (sitecode 600-278). After visual and field screening indicated no contamination above cleanup levels remained in the excavation, five verification composite samples were collected and analyzed to confirm that cleanup levels had been met. One sample was collected from each of the sidewalls at about 1 meter (3 feet) above the base of the excavation and one from the floor of the excavation.

surrounding ground in the lawn at 3709-A.

**Location:**
The site is located off the northeast corner of the 3709A Building.

**Process Description:**
The site is a drip station for the underground steam line that supplies steam for the 3709A Building. Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

**Code:** 300-228

**Name:** 300-228; Drip Station U28; HPD-TRP-026; Miscellaneous Stream #770; Steam Trap 3G-U28

**Type:** French Drain

**Status:** Inactive

**Description:**
The site is a french drain that received steam condensate. The drain is a concrete pipe covered with a 1.47 meter (4.28 foot) diameter perforated metal plate. The lid is labeled "U-28" and is posted "Danger, Limited Access/Confined Space." The top of the pipe appears to be flush with the ground surface. The site is located on a low rise relative to the surrounding area and is surrounded by sand and gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

**Location:**
The site is located west-northwest of the northwest corner of the 3760 Building.

**Related Sites/Structures:**
The site is a drip station for the underground steam line that supplies steam for the 3709A Building.

**Process Description:**
Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

---

**Code:** 300-230

**Name:** 300-230; HPD-TRP-29; Miscellaneous Stream #771; Steam Trap 3G-U44; U44

**Type:** Valve Pit

**Status:** Inactive

**Description:**
The site is covered with a 173-centimeter (68-inch) diameter diamond plate steel cover. Although the Inventory of Miscellaneous Streams, Rev 3 lists this site as a steam condensate injection well, it has been determined that it does not meet the definition of an Underground Injection Control well (UIC).

A square access hatch is located in the center of the cover. The below grade section is constructed of concrete with a dirt floor. The interior of the pit contains valves which released steam condensate to the floor. The site is labeled "U-44" and is posted as a "Confined Space."
Location: The site is located near the southeast corner of the 3746 Building.

Process Description: Steam is produced from sanitary water that has been sent through a water softener system to remove minerals (calcium and magnesium). The treated water is introduced into boilers to produce steam. This steam is superheated before distribution to facilities for heating and process use. Disposal sites receive steam condensate from the steam distribution lines. When used for heating purposes, this is a seasonal discharge. Non-regulated chemicals are added to dechlorinate the water, prevent scale, and control corrosion.

Reclassification: 300-235; 3713 Building Storm Water Runoff and Steam Condensate; Miscellaneous Stream #766

Names: Type: French Drain  Status: Inactive

Description: The site is a french drain that currently receives only stormwater. The drain is a concrete pipe that is covered by a 0.76 meter (2.49 foot) metal lid with perforations. The top of the pipe is flush with the ground surface and is surrounded by soil and gravel. The drain appears to be filled with soil to within approximately 0.7 meters (2.3 feet) of the top of the pipe. The lower 0.45 meters (1.5 feet) of the concrete pipe appear to be lined with some kind of a metal that is pulling away from the pipe. At least two, possibly three, metal pipes were observed extending into the side of the drain from the west. A small diameter (approximately 2.5 centimeters or 1 inch) pipe enters the side of the drain, makes a 90 degree turn and disappears into the floor of the drain. An approximately 5 centimeter (2 inch) open end pipe extends approximately 5 centimeters (2 inches) from the side of the drain. What appears to be a third pipe is covered with cobwebs that could not safely be removed. There are no pipes descending from the overhead steam line in the vicinity of the site. According to the "Inventory of Miscellaneous Streams," Revision 3, the steam source has been shut off.

Location: The site is located approximately 9 meters (29.5 feet) northeast of the northwest corner of the 3713 Building, under the overhead steam line.

Related Sites/Structures: The site is associated with the 3713 Building.

Process Description: Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

Reclassification: 300-236; HPD-TRP-020; Miscellaneous Stream #772; Steam Trap 3G-U45; U-45

Names: Type: Valve Pit  Status: Inactive

Description: The site is a valve pit that received steam condensate. The structure has a square concrete base with a 1.31 meters (4.30 feet) by 1.31 meters (4.30 feet) metal lid. The lid is labeled "U-45" and "Danger, Confined Space." The lid has a hatch that allows access to its interior. The top of...
the concrete base ranges from approximately 5 to 10 centimeters (2 to 4 inches) above the ground surface. The site is surrounded by sand and some gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

**Location:** The site is 10 meters (32.8 feet) southwest of the southwest corner of the 3719 Building. It is just east of the Apple Street Gate.

**Related Sites/Structures:** The site is related to the 300 Area steam line.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion.

**Code:** 300-237  
**Classification:** Accepted  
**Reclassification:** Rejected (5/26/1999)

**Names:** 300-237; Miscellaneous Stream #773; Steam Trap HPD-TRP-010

**Type:** French Drain  
**Start Date:**

**Status:** Inactive  
**End Date:**

**Description:** The drain was decommissioned in 2012. The site was described as a french drain that received steam condensate. An engineered structure was not evident in the field. A steam pipe runs down from the overhead steam line and terminates open-ended centimeters above the ground surface. The pipe is labeled "HPD-TRP-010." There is some soil discoloration where the pipe terminates above the ground surface that appears to be rust stains. This discoloration is confined to a very small area. There is also some rust discoloration on the concrete base of the pole that supports the steam pipe. The site is surrounded by sand with some gravel. According to the "Inventory of Miscellaneous Streams," Revision 3, the site is inactive, source abandoned.

**Location:** The site is located southeast of the southeast corner of the 303C Building, west of 3707D, on the west side of Wisconsin Street.

**Related Sites/Structures:** The site is associated with the 300 Area steam line.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. <td>The site was a french drain that received stormwater runoff. It was sealed with grout in 2005.</td>
</tr>
</tbody>
</table>
The drain appeared to be constructed of concrete and is covered by a 0.64 meter (2.10 foot) metal grate. The grate was stamped "STD 42" and its edge seems to be sealed. The drain appeared to be approximately 30 centimeters (1 foot) deep. The bottom was covered with sand and gravel. An approximately 10 centimeter (4 inch) diameter pipe entered the west side of the drain, makes a 90 degree turn towards the ground surface, and terminates with a screened opening. The top of the drain is flush with the ground surface, which is slightly depressed relative to the surrounding area. It appears as though the drain would collect runoff from the asphalt on the north side of 314 and from the gravel area southeast of 305B. During the December 17, 1998, walkdown, the inside of the drain appeared to be damp. The drain is surrounded by broken concrete, gravel and cobbles. The 314 Building is a closed facility. There is a similar structure west of this site, southeast of the southeast corner of 305B, south of the fenced area.

Construction drawings H-3-52655 and H-3-304714 sheet 2 show that the open bottom catch basin/french drain location is connected directly to the (300-15) process sewer pipeline.

Location: The site is approximately 17 meters west of the northeast corner of the 314 Building, just north of the asphalt.

Related Sites/Structures: The site is associated with the area on the north side of the 314 Building.

Description: The site is a concrete box that received drainage from the 325 Building. The box is a ground level, square, concrete structure with a steel cover. It measures approximately 0.9 meters (3 feet) by 0.9 meters (3 feet) and is approximately 0.6 meters (2 feet) deep. A large diameter carbon steel line coming from the basement of the 325 Building terminates inside the structure.

Location: The site is located approximately 4.5 meters (15 feet) east of the northwest corner of the 325 Building. The site is adjacent to Fire Protection Riser #1.
Code: 300-243

Classification: Not Accepted

Reclassification: None

Names: 300-243; 318 Building Stormwater Runoff; Miscellaneous Stream #792

Type: French Drain

Status: Active

Description: The site is a rectangular grate in the pavement. Water was observed in the bottom of the drain during a site walkdown on December 14, 1998.

Location: The site is located on the north side of the 318 Building in the asphalt driveway.

Related Sites/Structures: The site is related to the 318 Building.

Process Description: The drain receives stormwater runoff from the 318 Building.

---

Code: 300-244

Classification: Not Accepted

Reclassification: None

Names: 300-244; 318 Building Stormwater Runoff; Miscellaneous Stream #793

Type: French Drain

Status: Active

Description: The site is a horizontal, metal culvert that protrudes from the ground in a gravel depression. The pipe runs under the asphalt driveway, westward toward the 318 Building.

Location: The coordinates and location given in the Inventory of Miscellaneous Streams Report (Rev. 3) indicate this site is located on the east side of the 318 Building, east of the access driveway.

Related Sites/Structures: The site is related to the 318 Building.

Process Description: The drain receives stormwater runoff from the 318 Building.

---

Code: 300-248

Classification: Accepted

Reclassification: Rejected (5/26/1999)

Names: 300-248; 340B Steam Condensate Sump Pit

Type: Sump

Status: Inactive

Description: The site is a sump that collected condensate from process steam. The visible structure is approximately 1.22 meters (4 feet) in diameter, with an entry hatch. Originally, the sump was open to the ground under the building. Later the bottom was filled with concrete.

Location: The steam condensate sump is located inside the 340B building, near the southeast corner. The sump structure is located in side a radiologically controlled area.

Process Description: Steam was used to decontaminate rail cars at the 340 B building. The steam condensate sump collected condensate from the process steam. The contaminated solution that resulted from steam cleaning the railcars was flushed into a different drain that led to the Process Sewer.

---

Code: 300-249

Classification: Accepted

Reclassification: Final Closed Out (5/12/2014)

Names: 300-249; 304 Building; Residual Rad Contamination

<tr>
<td>Description:</td>
<td>The waste site has been remediated and Interim Closed Out. It was the 304 building and its foundation. The waste site was the residual radioactive contamination at the 304 Building that was not part of the Closed Out 304 Concretion Facility RCRA TSD.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Location:</td>
<td>The 304 Building was located in the northwestern 300 area on the south side of Ginko Street across from the 303-K, 314, and 313 Buildings.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Release</td>
<td>A billet fire in 1977 may have contributed to the spread of contamination within the building.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Description:</td>
<td>In August 1977, high temperatures inside the 304 Facility (resulting from the failure of the cooling system) caused six concrete billets in 28.4 liter (7.5 gallon) containers to ignite. Uranium oxide and small amounts of zirconium oxide and copper oxides were formed by the burning billets.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Related Sites/Structures:</td>
<td>300-249 is associated with 300-43, Unplanned Release Outside the 304 Building, 304 Concretion Facility (304 CF) and 304 Storage Area (304 SA).</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Closure Info:</td>
<td>The 300-28, 300-43, 300-48, 300-249, and 300-16:3 excavation of building foundations, associated pipelines, and soils began on June 28 and was completed by July 29, 2010. Due to elevated radiologically contaminated soil found north of 303E Building, additional remediation was performed September 30, 2010, targeting specific locations with elevated readings. The excavation of the 300-28, 300-43, 300-48, 300-249, and 300-16:3 waste sites resulted in a total of approximately 2,914 bank cubic meters (BCM) (3,811 bank cubic yards [BCY]) of contaminated soil and debris. All material was direct loaded for disposal at the Environmental Restoration Disposal Facility (ERDF).</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Remediation of the 300-28, 300-43, 300-48, 300-249, and 300-16:3 waste site excavations included removal of the 303A, 304, 304A, 303B, 3732, 303C, 3707D, and 303E Buildings concrete slabs. The manholes and intersections of the 300-15 process sewer were excavated and removed from within the excavation boundaries. All the foundation debris such as concrete, metal rebar, miscellaneous piping (steam, water, etc.), and electrical conduit was excavated and removed from the waste sites. No anomalous materials were observed during remedial activities.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Although remediation and verification sampling was performed for the 300-161 waste site, it was then noted that 300-161 waste site was reclassified as a Rejected site and therefore did not require remediation or site closure process. The 300-161 waste site was removed from the RSVP. The 300-60, 300-61, 300-62, 300-161, 300-162, 300-176, 300-193 and 300-237 Rejected waste sites were located within the 300-28, 300-43, 300-48, 300-249, and 300-16:3 excavation layback.</td>

<tr>
<td><strong>Description:</strong></td>
<td>This waste site was evaluated and Interim Closed Out in 2012. It was reclassified to Rejected in 2013 because buildings are outside the scope of WIDS. The waste site originally described the physical structure of the 327 building. The 327 Building demolition occurred from April 2009 through August 2010. The basement remained a posted Radioactive Contamination Area during final remediation and closeout actions. The building and foundation demolition was completed in May 2012. Soil samples were collected and analyzed in June 2012. [The 327 Basement was separated into 3 areas. The north third was used to store supplies, idle equipment, cell plugs, and includes the SERF Cell storage. Legacy wastes (buckets with pieces of Transuranic Waste [TRU]) were staged in this area pending disposal. The middle of the basement housed the hot cell ventilation ductwork, HEPA filters for the hot cells, and the activated charcoal filtration system. The activated charcoal filtration system did not have filters installed because there are no programmatic or regulatory need. An access hatch to a crawl space containing building steam pipes was also in this area. The south third of the basement was separated from the rest of the basement by a wall. It included a cold equipment room, and]</td>
</tr>
</tbody>
</table>
hot and cold exhaust supply fans for the facility air inlet system supply. It also contained the Retention Process Sewer system diverter, stack monitoring system, stack base plenum and related equipment, vacuum air sampling system and pumps, and steam system components.

**Location:**
The 327 Building was in the central part of the 300 Area, on the southwest corner of the intersection of California Street and Apple Street.

**Release Description:**
Several unplanned releases and occurrences are recorded for the 327 Building. Occurrence reports over the previous decades showed fires and explosions in several of the Cells, contamination found outside of normal containment (to areas within the building, the outside atmosphere, and soils under the building), and the Retention Process Sewer Line improperly connected to the Process Sewer Line.

More recently, the fire suppression sprinkle line broke December 26, 1998. An estimated 57,000 to 76,000 liters (15,000 to 20,000 gallons) of water was released into the basement of the 327 building. A portion of the water collected in the elevator shaft. An estimated 946 liters (250 gallons) leaked into the soils under the building before the rest could be pumped to the 307 Facility. Analysis showed the water to be slightly radioactive.

**Related Sites/Structures:**
The floor drains from the Cells flowed into the 300 Area Radioactive Liquid Waste System (RLWS), which drained to the 340 Waste Handling Complex. A concrete access port to the RLWS valve pit was located in the parking lot on the southeast corner of the 327 building. The 327 RLWS piping is isolated from the 340 Facility by blind flanges (nuclear blank) in the southeast corner of the hot side basement. The building was later connected to the 300 Area Retention Process Sewer (WIDS sitecode 300-214) which drained to the 307 Retention Basins. The building was originally connected to the Retired Radioactive Liquid Waste System (300 Area RRLWS).

**Process Description:**
The Post Irradiation Testing Laboratory (PTL) consisted of specially equipped, shielded, and ventilated Hot Cells and laboratories designed for physical and metallurgical examination and testing of irradiated fuels, concentrated fission products, and irradiated structural materials. The primary task was to determine the nature and causes of dimensional instability in fuel elements and the effects of irradiation stresses on pile materials. This involved destructive testing on extremely high level radioactive materials, including ruptured or failed fuel rods containing plutonium and fresh fission products. The irradiated grinding fines generated by the work were swept up and treated as solid wastes, but powdery dusts were spread into air filters, ducts, and pipes.

**Closure Info:**
Demolition of the 327 building and foundation was completed in May 2012. Residual contaminated soil removal was completed in June 2012. Subsequent evaluation of contaminated soil following the removal of the basement confirmed no releases from building operations had occurred. The residual soil contamination was the result of the building demolition activities. The exception is contaminated soil encountered during the removal of the Retired Radioactive Liquid Waste System (RRLWS) and Radioactive Liquid Waste System (RLWS) pipelines in the building layback area. The radiologically contaminated soil at the termination of the RRLWS and RLWS pipelines remains in place and will be addressed with the pipeline removal action.

Radiological surveys using hand held and global positioning radiological survey equipment were performed to identify contamination hot spots.

**Code:** 300-266  
**Classification:** Accepted  
**Names:** 300-266; Soil Under 3728 Building Drain Pipe  
**Reclassification:** Rejected (3/8/2001)  
**Type:** French Drain  
**Start Date:**
### Status: Inactive   End Date:

**Description:** The 300-266 drain pipe was removed during the demolition of the 3728 building in 2008 (Per CNN 148748). The site was soil below a 5-centimeter (2-inch) black plastic drain pipe on the southwest corner of the 3728 Building. In October, 1999, a white plastic bucket was placed under the drain pipe to catch any water draining out. The soil under the pipe is lightly graveled (as is the larger area around the entire building), with some of the gravel directly under the pipe washed away. The soil is not discolored. No engineered structure was built as an injection well.

**Location:** The soil is at the southwest corner of the 3728 Building, in the 300 Area.

**Related Sites/Structures:** The 3728 Building is the source of the drain pipe.

**Process Description:** The drain pipe is connected to a sink where containers are filled with de-ionized water. The de-ionized water system is also connected directly to the drain pipe, and contributes water to the pipe when the system undergoes maintenance. The water is site service water with trace amounts of sodium hypochlorite and hydrogen peroxide, used to disinfect the system.

<tr>
<td>Process Description:</td>
<td>The 11,356 liter (3,000 gallon) tank served as a gasoline fueling station until the 1960's. The dispensing pump was removed prior to 1968 and the tank was removed in 2002.</td>
<td></td>
</tr>
<tr>
<td>Closure Info:</td>
<td>The Site Assessment Results report states that the liquid removed from the tank consisted of water with impurities. The contents of the tank were sampled on December 17, 2001 and analyzed at the WSCF laboratory (see additional details under the &quot;Field Work&quot; tab). Excavation of the soil surrounding the UST, the pipe connecting the tank to the dispensing pump, and the concrete pad used to support the dispensing pump was completed by January 25, 2002. A total of 37 samples including QA samples were collected and analyzed for total petroleum hydrocarbons in both the diesel fuel and gasoline ranges. No evidence of leaking or failure of the connecting pipe or the tank was observed.</td>

*Hanford Site Waste Management Units Report*

February 2015
enough waste is accumulated to fill a labpack or bulking container, usually a 30 to 55 gallon drum. When a sufficient number of shipping containers of waste have accumulated, they are manifested for shipment, generally to permitted off-site recycling, treatment or disposal facilities.

Closure Info: On February 8, 2011, PNNL completed removal of waste stored at the 331-C Storage Unit. The majority of the waste stored at the 331-C Storage Unit was transferred offsite for treatment and disposal. The 331-C Storage Unit was transferred to Washington Closure Hanford (WCH) contractor (Co-Operator) in February 2011, to undergo closure. No further, waste management activities will be conducted in the facility prior to building removal and closure.

The RCRA TSD Dangerous Waste Permit Application Part A Form was Closed on 7/22/2011.

</tbody>
</table>
the present site conditions were obtained.

See detailed descriptions for each drain in site comment.

**Location:** The french drains are located throughout the 300 Area. See detailed locations for each drain in site comment.

**Related Sites/Structures:** The drains are associated with the 301, 314, 315, 331, 335, 382, 3701-A and 3701-L Buildings.

**Process Description:** Steam was produced from sanitary water that had been sent through a water softener system to remove minerals (calcium and magnesium). The treated water was introduced into boilers to produce steam. This steam was superheated before distribution to facilities for heating and process use. Disposal sites received steam condensate from the steam distribution lines. When used for heating purposes, this was a seasonal discharge. Non-regulated chemicals were added to dechlorinate the water, prevent scale, and control corrosion. One drywell drained the stairwell landing of the first floor of the 314 building of rainwater.

The contaminated soil under and surrounding the facility was documented as WIDS site 300-251.</td>
<td></td>
</tr>
<tr>
<td>Process Description</td>
<td>The main building was constructed in 1943 to store radioactive and mixed waste generated in the 300 Area. From 1943 to 1953, uranium and aluminum canned uranium was stored in the building. In 1953, the building was partitioned, floor trench drains and work benches were installed in the north room. In 1953 and 1978, outdoor storage pads (concrete and asphalt) were constructed to support the decontamination of aluminum reactor spacers until 1971. From 1953 to present, radioactive and mixed waste had been stored outside the building on the concrete, asphalt, and gravel pads. From 1971 to 1977, the north room was used for equipment decontamination and for storage. The interior walls were painted with a lead-based paint in 1977. Between 1977 and the fall of 1982 the unit was used to cure and test concreted billets of uranium chips and fines from the 304 Concretion Facility. Additional outdoor storage pads were installed in 1978 (asphalt) and in 1979 (concrete). From 1982 to 1986 the building continued to be used for equipment decontamination and storage. After 1986, the building was used to store containers of low-level radioactive waste and mixed waste.</td>

</tr>
<tr>
<td>Closure Info</td>
<td>Physical closure activities for the 303-K CWS were completed July 2002. Closure Certifications were prepared in accordance with the Washington Administrative Code (WAC)</td>
<td></td>
</tr>
</tbody>
</table>
173-303-610 and the approved 303-K Storage Facility Closure Plan, DOE/RL-90-04, Rev. 2A as amended by the Hanford Facility RCRA Permit, Part V, Chapter 14. The certifications attest that 303-K Storage Facility closure activities are complete and were performed in accordance with the approved closure plan. A Professional Engineer certified completion of closure on August 15, 2002. After closure activities were achieved and verified, Ecology-approved clean closure criteria for soils and structures. Ecology formally acknowledged the closure certification for the 303-K Storage Facility by letter, DOE/RL 02-RCA-0424, dated August 5, 2002.

To complete the clean closure and in accordance with the closure plan, the entire 303-K Building was demolished. The rubble and excavated soil were designated and disposed of as low-level waste at the Hanford site Low Level Burial Grounds (LLBGs). After the site inspection, the soils were compacted and the site was backfilled with gravel.

The reclassification to Closed Out is documented on from 2003-031.

**Description:** The RCRA waste treatment portion of the facility was Closed in 1995. The 304 building and its foundation were remediated in 2010 as a CERCLA remediation (see Sitecode 300-249).

**Location:** The unit is located in the northwestern 300 Area on the south side of Ginko Street across from the 303-K, 314, and 313 Buildings.

**Release Description:** During concretion operations, the 304 Facility floor was washed down daily with water. Because the steel walls of the main building were not sealed to the concrete wall base until 1989, and there were numerous small holes in the walls, rinse water splashing against the steel walls might have carried contamination out of the building. In addition, there were no berms at the north and south doors to stop washdown water from leaving the building. The north fenced pad does not have a berm to contain spills or precipitation. The north sliding door normally was left open to allow forklift traffic for container transport. A billet fire in 1977 may have contributed to the spread of contamination within the building. In August 1977, high temperatures inside the 304 Facility (resulting from the failure of the cooling system) caused six concrete billets in 28.4 liter (7.5 gallon) containers to ignite. Uranium oxide and small amounts of zirconium oxide and copper oxide were formed by the burning billets. Cleanup water was drained through the drainage trenches into the process sewer. After the 1977 fire, concrete billets were cured initially in cold water cooling pans before being transported to the 303-K Facility where the final curing process took place.

**Related Sites/Structures:** Units associated with this site include 300-249, the 304 Storage Area (304-SA), 300-249, the 300 Area Process Sewer, and internal process equipment.

**Process Description:** The 304 Concretion Facility consisted of a RCRA container storage area and a RCRA concretion system used to treat mixed waste and recyclable uranium scrap. The 304 Facility was in operation from 1952 to 1988. During this time, the following activities occurred:

- From 1952 to the late 1950's, the building was used as a pilot plant to fabricate aluminum-clad uranium cores by lead-dip canning process.
- From the late 1950's to the mid-1960's, the building was used as a pilot plant to electroplate uranium with nickel.
- From the mid-1960's to 1971, the building was used to store engineering equipment and
product chemicals.
- From 1971 to 1982 recyclable scrap uranium with zircaloy-2 and copper-silicon alloy chips and fines were concreted into billets. Beginning in 1977, the billets were cured in both the 304 Facility and 303-K Radioactive Mixed Waste Storage Facility (303-K Facility) before being shipped to Fernald, Ohio, for uranium recovery.
- From 1972 until 1986, beryllium/zircaloy-2 alloy and zircaloy-2 chips and fines were concreted in containers to reduce their ignitability. These containers were buried in the 200 Areas burial grounds.
- From 1975 to the spring of 1988, depleted uranium alloy chips and fines from Pacific Northwest Laboratory (PNL) were concreted into billets and returned to PNL for subsequent shipment to the 200 Areas burial grounds.
- In the spring of 1994, pyrophoric metal waste from dismantling of the 300 Area fuel processing equipment was concreted in drums to reduce ignitability. These drums were buried in a 200 Area burial ground. This is the final treatment activity planned for the 304 Facility.

Waste treated in the 304 Facility was generated by processes in the 300 Area. The waste sources are summarized as follows:

- Beryllium/zircaloy-2 alloy and zircaloy-2 chips and fines that were stored temporarily at the 303-K Facility were concreted into containers to reduce their ignitability.
- From 1985, spent counterbore lathe coolant (an aqueous synthetic lubricant) from lathes in the 333 Building was stored at the 303-K Facility until it could be used as makeup water in the 304 Facility cement mixer during concretion of chips and fines. The coolant was a nonregulated material. The spent counterbore lathe coolant used for makeup water for concretion in the 304 Facility was Polar chip 350L, which was diluted with water 20 to 1. Besides uranium, copper-silicon alloy, zircaloy-2 alloy, and graphite particulate, the only other potential contaminant in the lathe coolant was AW Hydraulic Oil 32, used in the counterbore lathe.

During concretion operations, the 304 Facility floor was washed down daily with water. Because the steel walls of the main building were not sealed to the concrete wall base until 1989 and there were numerous small holes in the walls, rinse water splashing against the steel walls might have carried contamination out of the building. In addition, there were no berms at the north and south doors to stop washdown water from leaving the building. The north fenced pad does not have a berm to contain spills or precipitation. The washing down of the floor is unlikely to have caused airborne contamination, because damp uranium saw fines and chips are too large and dense for easy air suspension. Uranium has a specific gravity of 18.9 and uranium oxides have a specific gravity of 7.3 to 10.9. Damp saw fines have a tendency to stick together and about 73 percent of new saw fines are greater than 100 mesh (150 microns). In addition, the cyclone precipitator was in operation at all times when the cement bags were emptied and the concrete mixer was in operation.

During concretion operations, the north sliding door normally was left open to allow forklift traffic for container transport.

A floor drain near the cement mixer discharged to the sump where fines settled out. The sump has a removable screened standpipe about 40.6 centimeters (16 inches) high that overflowed into an underground drain line to the process sewer on the east side of the building. A water line discharged directly into the overflow pipe below the screen and was used in the concretion process. This flowing water (flow rate unknown) helped prevent the P-trap from plugging with concrete, which happened at least twice during the operation of the 304 Facility. No radiation detectors were in the process sewer and no routine sampling of the process sewer from the 304 Building occurred. Sampling was done at the outflow from the combined 300 Area process sewer system.

Once a year during the recyclable uranium concretion operation (1971 to 1982), a 3-day sample
of the overflow pipe in the sump was taken to calculate a loss factor to the sewer for uranium chips and fines. The highly variable flow rate was calculated by adding a known dilute concentration of lithium nitrate (0.2 pound per gallon) at a known flow rate to the sump for a known sampling time. The change in lithium concentration and time would give the total volume of solution discharged from the sump.

Until March 1975, all waste liquid chemicals in the fuels operation were discharged to the process sewer. Therefore, during the nickel-plating pilot plant operation (late 1950's to mid-1960's), waste chemicals from this operation in the 304 Facility would have entered the process sewer. Routine discharges of chemicals to the process sewer were terminated after March 1975.

During concretion operations, the water that covered the uranium chips and fines, and 5 percent beryllium/zircaloy-2 chips in the incoming drums, were drained into the process sewer after passing through the sump to settle out entrained solids. The water covering the chips and fines would have contained an unknown amount of cutting fluid from the lathe operations. Four different types of cutting fluids were used.

In the summer of 1988, spent halogenated solvents consisting of perchloroethylene, 1,1,1-trichloroethane, and rinse water used in degreasing tanks in the fuels manufacturing process were stored at the 303-K and then moved to the 304 Facility for repackaging. Included in this repackaging effort was waste from the 300 Area paint and sign shop. Repackaging was accomplished by placement into new containers along with absorbent material. The containers were returned to the 303-K Facility. Handling and storage time for these spent solvents at the 304 Facility was less than 90 days. Ethyl acetate-bromine solutions generated from laboratory analysis work for uranium were occasionally mixed with the degreaser solvents. No spills were reported during this operation.

It is recognized that several factors associated with operations may have resulted in contamination of the 304 Facility. These factors include use of the building to house pilot plants, concretion operations, the occurrence of a billet fire in 1977, repackaging of spent solvents and ethyl acetate-bromine solutions, and storage of spent counterbore lathe coolant inside the building and on the outside storage pad.

One final concretion was run at the 304 Facility during the mid-1990's. This concretion run was used to treat and stabilize pyrophoric material generated during the final disassembly and removal of the fuels processing equipment. Prior to starting the final concretion run, all floor drains were to be plugged to prevent the entry of water. The concretion was done in the disposal containers to eliminate the need to use the cement mixer.

**Closure Info:** The Reclassification to Closed Out for the 304 CF TSD unit is documented on Reclassification form 99-094. The Reclassification to Closed Out for the 304 SA TSD unit is documented on Reclassification form 2000-01. Regulator concurrence with supporting documentation eliminated the need for signatures on these forms. The 304 building and its foundation were remediated in 2010 as a CERCLA remediation (see Sitecode 300-249).

The cleanup and closure strategy for the site was to decontaminate the interior of the 304 Building to remove known or suspected contamination, then to sample for the constituents of concern, and then to perform data analysis, with an evaluation to determine the required actions to meet closure criteria. Criteria for the 304 Concretion Facility was that the concentrations of potentially dangerous constituents treated, stored, or used not be present above the regulatory cleanup levels. If the potentially dangerous constituents are above action levels, then the evaluation was to determine the actions required. The evaluations could consider the type and extent to which the action levels were exceeded, and an assessment of health based risks. Generally, if the decontamination for dangerous constituents was not effective, the appropriate building section, floor, or pad was to be removed and properly disposed of as mixed waste. The
radiological contamination at the 304 Concretion Facility was not addressed by the closure plan.

Phase I Decontamination was to vacuum to remove any loose contamination. Areas excluded from decontamination were the change room interior, all exterior surfaces of the 304 Building, and the exterior concrete and asphalt pads. All areas within the facility were vacuumed. No unusual incidents occurred.

Phase II decontamination was to damp wipe decontamination with a detergent solution to remove surface contamination. There were two areas that could not be decontaminated successfully, the sump and the trench. In both areas, the concrete on the sides and floor crumbled as it was wiped. The crumbling of the concrete prevented effective decontamination. There were approximately 75 millimeters (3 inches) of cement dust, sand, and chunks of semi-consolidated cement. The source of the sump material was the past concretion operations that used water to wash metallic fines and lose cement powder into the sump where the fines settled out. Both areas contained sampling points that were used to determine if any of the constituents of concern were present.

The facility connection to the Process Sewer is not part of the TSD (per the Closure plan).

Under Section 8.2 Post Closure Care of the 304 Concretion Facility Closure Plan (DOE/RL-90-03), the document states that the underlying soils and groundwater might have been contaminated by waste generated during past practice operations in the 300 Area. All soil remediation will take place under the CERCLA remedial action process (WIDS Sites 300-43 and 300-249). If the soil within the 304 Facility boundary is found to be contaminated from operations conducted in the 304 Facility, the 304 Facility will not be considered Closed until the remediation under CERCLA is complete.

</tbody>
</table>
proper storage areas, depending on waste type and quantity. Dangerous waste was stored on the first floor, in the high bay area. Four storage cells were constructed in the high bay to segregate incompatible waste (Acids and Oxidizers, Poisons and CRV's, Caustics and WSDW and Organics). Non-flammable Radioactive Mixed Waste was stored in the basement of the original building. The area is capable of segregating wastes in four 7.6 meter by 7.6 meter (5 foot by 5 foot) stainless steel container pans. Flammable radioactive mixed waste could not be stored in the basement. Flammable material was stored in the east portion of the building in a 2.1 by 2.1 meter (7 foot by 7 foot by 7 foot) flammable liquid storage module. When a sufficient amount of waste has been accumulated, waste is transported to a permitted offsite treatment/disposal facility.

Prior to use as a treatment storage and disposal facility, the unit housed two test reactors that operated from the mid 1950's until 1978.

Closure Info: In March 2006, Pacific Northwest Nation Laboratory completed transferring all the waste stored at the 305-B Storage Facility to an offsite TSD facility and to the 331-C storage Unit. The 305-B facility was transferred to the Washington Closure Hanford contractor in June 2006 for Closure and demolition.

The 305-B building was demolished in December 2006.

The Reclassification to Closed for the RCRA TSD is documented on form 2008-051.

Description: The 307 Retention Basins were deactivated in December 2011 and were demolished in June 2012. The basin is considered a component of the facility and the reclassification was changed to Rejected in 2013. The structure consisted of four open, epoxy-coated, concrete basins. Each basin had a 94,500 liter (25,000 gallon) capacity. The Retention Process Sewer (RPS) tied into the basins on the north side, passing through a sample pit northwest of retention basin #1. The 300 Area Process Sewer and the Radioactive Liquid Waste Sewer (RLWS) drained from the south side of the basins.

Location: The 307 Retention Basins were located directly south of the 340 Building and the 340 Vault. The basins were part of the 340 Complex, inside the 340 Complex fence.

Related Sites/Structures: The 307 basins are associated with UPR-300-1, the 300 Area Process Sewer (WIDS Site 300-15), the Retention Process Sewer (RPS) (WIDS Site 300-214), the Radioactive Liquid Waste Sewer (RLWS) (WIDS Site 300 RLWS), Retired Radioactive Liquid Waste Sewer (RRLWS) (WIDS Site 300 RRLWS), and the 340 Complex (WIDS Site 340 Complex) are all associated with the 307 Retention Basin operations. Generating facilities tied into the RPS include the 324, 325, 326, 327, and 329 Buildings. The 308 Building was isolated from the system in 1996. The 325 Building will be the last facility to be isolated from the RPS.

Process Description: The retention basins were fed by the Retention Process Sewer (RPS) and discharged to the 300 Area Process Sewer. The facilities tied into the RPS, except for the 308 building, were equipped with in-line beta-gamma detectors at diverter stations in the basement of each building. The 308 Building did not have in-line detectors. In 1996, the diverter station in the 326 building was upgraded and took over for both the 326 and 329 buildings. In the event that a detector alarm tripped, all the RPS waste was routed to the Radioactive Liquid Waste Sewer (RLWS) by valves at the diverter station. Waste in the retention basin was then sampled. In the
event that sampling detected basin waste above discharge limits, the valves at the retention basins enabled operations personnel to route basin effluent to the RLWS.

After 1995, the retention waste below discharge limits was routed to the 300 Area Treated Effluent Disposal Facility (310 TEDF). From 1975 to 1994, the retention basin discharged to the 316-5 Process Trenches. From 1963 to 1975, it discharged to the process ponds (WIDS Sites 316-1 and 316-2). From 1953 to 1963, retention waste below discharge levels was discharged to the 307 Trenches (316-3).

With the retirement of the RLWS in 1998, waste above the discharge limits is held was the retention basins until it could be transported to the 200 Area double-shell tanks. Prior to 1998, waste above the discharge criteria was discharged to the RLWS and 340 Vault tanks. The waste sent to the 340 Vault tanks was transported by tanker truck or rail to the 200 Area for storage or disposal.

### Code: 309-TW-1
#### Classification: Accepted
#### Names: 309-TW-1, 309 Holdup Tanks, 309-TW Tank #1
#### Reclassification: Rejected (8/13/2013)
#### Type: Storage Tank
#### Start Date: 1/1/1960
#### End Date: 1/1/1973
#### Description: Tank 309-TW-1 is the northernmost tank in the 309 Holdup Tank System. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. All three tanks are located in a rectangular, underground concrete vault. A chain-link fence surrounds the site. Pumps, vents, piping, a valve box and the top of the concrete vault are visible above grade. The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.
#### Location: The tank is located at the north end of a concrete vault northeast of the 309 Building.
#### Related Sites/Structures: Structures associated with the tank include the other two holdup tanks, the adjacent valve box, the 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.
#### Process Description: Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer. Contaminated effluent from the 309 Building facility was designed to be directed to the PRTR transfer waste tank farm (also known as TW Tank or Holdup Tank). It was located to the northeast of the 309 Building reactor containment vessel. The tank farm consisted of three underground tanks on a buried concrete pad, an adjacent concrete valve pit, and underground piping. The tanks are commonly known as TW-1, TW-2, and TW-3.

### Code: 309-TW-2
#### Classification: Accepted
#### Names: 309-TW-2, 309 Holdup Tanks, 309-TW Tank #2
#### Reclassification: Rejected (8/13/2013)
#### Type: Storage Tank
#### Start Date: 1/1/1960
#### End Date: 1/1/1973
#### Description: Tank 309-TW-2 is the center tank in the 309 Holdup Tank System. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. All three tanks are located in a rectangular, underground concrete vault. A chain-link fence surrounds the vault. Pumps, vents, piping, a valve box and the top of the concrete vault are visible above grade.
The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.

**Location:** The tank is located at the center of a concrete vault on the north east side of the 309 Building.

**Related Sites/Structures:** Structures associated with the tank include the other two holdup tanks, the adjacent valve box, the 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.

**Process Description:** Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer.

---

**Code:** 309-TW-3  
**Names:** 309-TW-3; 309 Holdup Tank; 309-TW Tank #3  
**Reclassification:** Accepted

**Reclassification:** Rejected (8/13/2013)

**Type:** Storage Tank  
**Start Date:** 1/1/1960  
**End Date:** 1/1/1973

**Description:** Tank 309-TW-3 is the southernmost tank in the 309 Holdup Tank System. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. All three tanks rest in a rectangular, underground concrete vault. A chain-link fence surrounds the vaults. Pipes and risers are visible above grade. The tanks are empty and the line to the sewer is capped. Residual contamination is present in the tanks and piping.

**Location:** The tank is located at the south end of a concrete vault on the northeast side of the 309 Building.

**Related Sites/Structures:** Structures associated with the tank include the other two holdup tanks, the adjacent valve box, 309 Building, and the 300 Area radioactive liquid waste sewer. WIDS Site 300-255 (309 Tank Farm Contaminated Soil) addresses the contaminated soil inside the 309 Tank Farm fence.

**Process Description:** Contaminated liquid waste from the operation of the reactor was pumped to the holdup tanks prior to discharge to the radioactive liquid waste sewer.

---

**Code:** 309-WS-1  
**Names:** 309-WS-1; PRTR Ion Exchange Vault; Reactor Ion Exchange Pit; 309 Plutonium Recycle Test Reactor Ion Exchanger Vault  
**Reclassification:** Accepted

**Reclassification:** Rejected (8/13/2013)

**Type:** Process Unit/Plant  
**Start Date:** 1/1/1961  
**End Date:** 1/1/1969

**Description:** The 309-WS-1 Vault is a below grade, reinforced concrete structure containing two levels. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. The vault has connecting piping to the dome. The upper (main vault) level housed the ion exchangers (IX) used for moderator cleaning, while the lower (resin disposal) level was used to store spent columns. The lower vault has been cleaned of debris, decontaminated and coated with a fixative paint. The upper vault was cleaned of debris and swept clean. Access to the upper vault is through shielding blocks and access to the lower vault is through two concrete plugs.

**Location:** The unit is located on the northeast side of the 309 Building containment dome.

**Related Sites/Structures:** The 309 Plutonium Recycle Test Reactor (PRTR) Building is the only structure associated with the vault.
Process Description: Prior to deactivation, the unit was used to remove contaminants from the heavy water and shield cooling systems.

Code: 309-WS-2
Names: 309-WS-2; Ion Exchange Vault; PRTR Rupture Loop; RLAIX; Rupture Loop Annex Ion Exchange Loop Vault; Rupture Loop Ion Exchange Pit
Type: Process Unit/Plant
Status: Inactive
Start Date: 1/1/1960
End Date: 1/1/1969
Classification: Accepted
Reclassification: Rejected (8/13/2013)

Description: The 309-WS-2 Ion Exchange Vault (RLAIX) is an underground, reinforced concrete structure. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. The unit is divided into five stalls. Four stalls held horizontally configured ion exchange columns, while the fifth stall is covered by a steel plate. A drain in the fifth bay discharged to a sump in Room 20 of the 309 Building. A rain cover has been installed over the top of the vault to prevent water from entering the vault.

Location: The unit is located off of the northwest side of the 309 Containment Dome.

Related Sites/Structures: The Fuel Element Rupture Test Facility, the Rupture Loop Annex (also known as Room 20), and the 309 Plutonium Recycle Test Reactor Building are associated with the unit.

Process Description: The ion exchange columns were used to remove contaminant and fission fragments from the light water coolant.

Code: 309-WS-3
Names: 309-WS-3; 309 Brine Tank
Type: Storage Tank
Status: Inactive
Start Date: 1/1/1960
End Date: 1/1/1969
Classification: Accepted
Reclassification: Rejected (8/13/2013)

Description: The unit has been backfilled, and grass has been planted above the tank. The Brine Tank is a below grade, rectangular concrete structure with two chambers. It is considered a component of the 309 facility and was reclassified to Rejected in 2013. Access/loading ports were installed on the top of the tank. Inside the tank, four perforated transite pipes ran the length of the main chamber. The pipes were suspended in a gravel filter bed and covered by a layer of sand. The second chamber acted as a holding tank.

Location: The unit is located below grade, off the southwest corner of the 309 Building.

Related Sites/Structures: Structures associated with this unit include the brine tanks in the 309 Building basement, the reactor heat exchange systems, and the liquid transfer lines.

Process Description: The unit has been backfilled and is inactive. During use the container held salt that was slurried and pumped through plastic pipes to three brine tanks located in the basement of 309 Building. These tanks supplied process water used to cool several small heat exchangers for the reactor.

Code: 311-TK-40
Names: 311-TK-40; 311 Neutralized Waste Tank 1
Type: Storage Tank
Start Date: 1/1/1953
Classification: Accepted
Reclassification: Closed Out (7/8/2013)
**Status:** Inactive  

**End Date:**  

**Description:** The RCRA TSD was Clean Closed as part of the 300 Area Waste Acid Treatment System (WATS) Partial Closure in December 2001. The 311-TK-40 tank was an isolated, stainless steel cylinder in the horizontal position. The tank was positioned within a concrete containment structure.

**Location:** The unit lies between the 303-F and 303-G Buildings.

**Related Sites/Structures:** Structures associated with the tank include 311-TK-50, the 303-F Building, and the 300 Area WATS.

**Process Description:** The tank was part of the WATS from 1973 until 1985. It was used for storing neutralized waste prior to disposal. From 1953 to 1973, the system was used to store nitric acid.

**Closure Info:** The RCRA TSD has been Clean Closed. The site was covered under a RCRA Part A Permit Application, and a closure plan was filed with Ecology in 1990. A Decontamination and Decommissioning Plan was issued for Phase III closure of the 300 Area Waste Acid Treatment System which includes this tank. Tank 311-TK-40 will remain in place after closure. It has been decontaminated in-place to a 'clean debris surface' standard. The stainless steel jacket and insulation have been removed to allow full inspection. The insulation was sampled based on visual observations (of worst case matrix). Residue samples were collected from the heel in tank TK-40. The sample was determined by TCLP to have less than the regulatory limit (per WAC 173-303-090, Toxicity Characteristic List) for all RCRA metals. A small quantity of liquid was collected from the recirculation line from the bottom of TK-40 to the 303-F Building (even though the tank was dry). The sample of the drained TK-40 liquid was found to be non-corrosive (pH 9.12), but was determined by ICP to contain greater than the regulatory limit for both chromium (8.53 micrograms per milliliter [ug/ml]) and silver (6.41 ug/ml) compared to a designation threshold of 5 ug/ml for each according to WAC 173-303-090, Toxicity Characteristics Limit.

The Reclassification is documented on form 2001-100.

<table>

<td>Start Date: 1/1/1985</td>
</tr>
<tr>
<td>Status: Inactive</td>
<td>End Date:</td>
</tr>
</tbody>
</table>

**Description:** The tank was a RCRA TSD that was part of the 300 Area Waste Acid Treatment System (WATS) has been Closed Out. The 311-TK-50 tank was a 18,927 liter (5000 gallon) vertical stainless tank that has been drained, characterized, isolated.

**Location:** The unit is located within a concrete catch basin in the 311 Tank Farm between the 303-F and 303-G Buildings in the north central 300 Area.

**Related Sites/Structures:** Structures associated with the tank include 311-TK-40, the 303-F Building, the Pipe Trench, the 300 Area Waste Acid Treatment System equipment in the Uranium Recovery Room of the 313 Building, and the 340 Facility.

**Process Description:** Tanks TK-40 and TK-50 were used to store neutralized acid waste from the 300 Area Waste Acid Treatment System (WATS), 311-TK-50 was installed in 1985.

**Closure Info:** The RCRA TSD was Clean Closed under the 300 Area WATS Partial Closure in 2001. It was covered under a RCRA Part A Permit Application. The closure plan was filed with Ecology in
1990. A Decontamination and Decommissioning Plan was issued for Phase III closure of the 300 Area Waste Acid Treatment System which includes this tank. Tank 311-TK-50 will remain in place after closure. It has been decontaminated in-place to a "clean debris surface" standard. The stainless steel jacket and insulation will be removed to allow full inspection. The insulation will be sampled based on visual observations (of worst case matrix). Residue samples from tank TK-50 along with samples of the liquid/sludge drained from the piping and the pumps and filters (which were located in the 303-F Building) were used to characterized the tank TK-50 subsystem. The liquids which contained 8% solids had a pH of 10.4. ICP lab results for both liquids and solids samples reported less the regulatory limit (see WAC 173-303-090, Toxicity Characteristic List) for all RCRA metals. Similarly, the sample of solids was determined by TCLP to have less that the regulatory limit for all RCRA metals. A dried sample of process residue from inside tank TK-50 was analyzed and shown to be non-corrosive, contained no beryllium and included less than the regulatory limit for RCRA metals. A sample of the filter element contained in the upstream in-line filter housing was removed and sent to the lab for analysis. This information will be used to determine disposal or applicable WATS Phase III waste. The contaminants contained in the filter element are expected to have been indicative of the materials processed during the final WATS operations, which were all managed in tank TK-50. The sample of the filter element was determined by TCLP to have less than the regulatory limit for all RCRA metals, a pH of 7.42, no detectable beryllium and no detectable PCBs.

| Code: | 313 CENTRIFUGE | Classification: | Accepted |
| Names: | 313 CENTRIFUGE; 300 Area WATS; 313 Centrifuge | Reclassification: | Closed Out (12/6/2001) |
| Type: | Process Unit/Plant | Start Date: | 1/1/1985 |
| Status: | Inactive | End Date: | 1/1/1997 |
| Description: | This site has been Clean Closed under the 300 Area Waste Acid Treatment System (WATS) Partial Closure. The centrifuge was removed in 1997 and disposed of as low level solid waste. The 300 Area Waste Acid Treatment System was closed in phases. It was totally closed on 10/30/2005. |
| Location: | The centrifuge was located in the Uranium Recovery Room in the southern end of the 313 Building in the 300 Area. |
| Related Sites/Structures: | Structures associated with the unit include transfer lines, 313-TK-2, 313-TK-11, the 313 Filter Press, and the other portions of the waste acid treatment system. |
| Process Description: | The centrifuge was installed in 1985 to reduce the solids content of the final neutralized waste prior to trucking out to the 200 Areas for disposal. Neutralized acid waste was pumped from 313-TK-2 through the centrifuge to 313-TK-11 and then via piping in the pipe trench to the waste storage tanks 311-TK-40 and 311-TK-50 in the 311 Tank Farm. The centrifuge solids were drummed and sent to 303-K for storage prior to burial as low-level solid waste. As needed, the stored waste solutions in Tanks 40 and 50 were recycled through in-line filters in the 303-F Building and back via the pipe trench to the Uranium Recovery Room in the 313 Building for additional solids removal. The 313 Centrifuge and the 313 Filter Press were both used during such recycle activities. |
| Closure Info: | The waste site RCRA permit has been Clean Closed. The Centrifuge was removed in 1997 in accordance with the Decontamination and Inspection Plan for Phase 1 Closure of the 300 Area Waste Acid Treatment System. Ecology completed an inspection of the site in October 1997 and agreed that removal was done in accordance with this plan. The reclassification is documented on form 2001-102. |
### Code: 313 CRO
#### Classification: Not Accepted
#### Names: 313 CRO; 313 Building Copper Remelt Operations; 313 Copper Remelt Operations
#### Type: Process Unit/Plant
#### Status: Inactive
#### Description: The 313 Copper Remelting Operation was performed in the southern end of the 313 Building. The 313 Building is a large structure resting on a reinforced concrete slab floor. The walls are concrete block and structural steel framing. The roof is a precast concrete slab covered in tar and gravel. Interior walls are concrete block or concrete brick.
#### Location: The unit is located in the original (southern) portion of the 313 Building.
#### Related Sites/Structures: Structures associated with the unit include furnaces, casting equipment, and machine equipment used in the copper remelting operations.
#### Process Description: Copper-silicon alloy scrap materials from the fuel fabrication process were collected, melted, cast, and machined for reuse in the N Reactor Fuel Fabrication operations.

### Code: 313 FP
#### Classification: Accepted
#### Names: 313 FP; 300 Area Waste Acid Treatment System; 313 Filter Press
#### Type: Process Unit/Plant
#### Status: Inactive
#### Description: This site has been Clean Closed under the RCRA TSD 300 Area Waste Acid Treatment System. The 313 Filter Press was removed in 1997 and buried as low level solid waste. The 300 Area Waste Acid Treatment System was closed in phases. It was totally closed on 10/30/2005.
#### Location: The TSD unit was located in the Uranium Recovery Room inside southern portion of the 313 Building.
#### Related Sites/Structures: Structures associated with the unit include the U-Bearing Acid storage tanks (TK 3 and TK4), the Caustic Feed Tanks (TK5 and TK6), the Neutralization and Precipitation Tank (TK7), the Filter Press Feed Tank (TK8), and the Filtrate Storage Tanks (TK 9 and TK-10) in the Uranium Recovery Room of the 313 Building, the neutralized liquid effluent storage and load-out tank (TK 40) in the 311 Tank Farm, and the 303-K Contaminated Waste Storage Facility. The 300 Area Waste Acid Treatment System Pipe Trench and the Process Sewer supported the operation of the 313 Filter Press. Contaminated soil under this facility is site UPR-300-38.
#### Process Description: The filter press was used to recover uranium from spent nitric acid etching solutions from the uranium fuels manufacturing operations in the 300 Area. The uranium-bearing nitric acid solutions were transferred to two 1700 liter storage tanks (TK-3 and TK-4) in the Uranium Recovery Room in the south end of the 313 Building. The uranium was precipitated during neutralization of the nitric waste acid with caustic in a 1400 liter Tank (TK-7) and then transferred to the filter feed tank (TK 8). The sodium diuranate slurry was pumped through the filter press to remove uranium solids. Prior to October 1972, the filtrate drained to the process sewer. After October 1972, the filtrate was stored in two 2120 liter tanks (TK 9 and TK 10) until pumped from the 313 Building to a 15,100 liter waste storage loadout tank (TK 40) in the 311 Tank Farm via piping in the pipe trench. The filter press was periodically opened to scrape the sodium diuranate solids from the canvas filter cloth on each filter press frame. The solids were put into 114 liter (30 gallon) drums and transferred to the 303-K Building (see 303-K CWSF) for storage pending shipment off-site for uranium recycle.
Closure Info:  This site has been Clean Closed under RCRA. The closure certifications include the Professional Engineer (PE) Partial Closure Certification (Dated June 7, 2001), the U.S. DOE Partial Closure Certification (Dated December 3, 2001), and Ecology's approval of the U.S. DOE's certification for partial clean closure of the 300 Area WATS (Dated December 6, 2001).

The reclassification is documented on form 2001-103.

In December 1996, a Decontamination and Inspection Plan was issued for Phase 1 closure of the 300 Area Waste Acid Treatment System. The equipment in the Uranium Recovery Room in the 313 Building including the 313 Filter Press was removed and buried as low level solid waste in the 200 Area in 1997. During the Phase 1 work, the contaminated areas of the floors in the Uranium Recovery Room were cleaned by scabbling. A few small floor cracks, some exposed acid brick, and one construction joint connected to the soil beneath the facility were identified prior to performing the decontamination and inspection outlined in the plan for Phase 1 closure activities. Ecology completed an inspection of the cleaned site in October 1997 and agreed that removal was done in accordance with this plan. A RCRA closure plan was issued in 1990 for the 300 Area Waste Acid Treatment System which included the Uranium Recovery Operations in the 313 Building, with revisions in 1996 and 1999.

</tbody>
</table>
Tanks 313-TK-5 and 313-TK-6 contained sodium hydroxide used in the neutralization and precipitation process.

**Process Description:**

The 313 Uranium Recovery Operations (URO) processed uranium-bearing acid wastes from the fuel fabrication processes to recover uranium for recycle. U-bearing acid wastes were received from the 313 Fuels Operations until 1971. From 1961 until shutdown in 1987, U-bearing waste acid solutions were transferred from tank TK-24 in the 333 Building to two outside storage tanks on the west side of the 333 Building. The U-bearing waste acid was pumped from the outside storage tanks via the pipe trench to the 313 Building tanks TK-3 and TK-4 in the Uranium Recovery Room. The uranium was recovered by precipitation and filtration. U-bearing acid waste was metered into TK-7 where sodium hydroxide (from Tanks 5 and 6) was added to neutralize the acid and precipitate uranium as sodium diuranate. The basic slurry was collected in tank TK-8 and pumped though a plate and frame filter (see 313 FP) to remove the uranium. The filtrate was collected in tanks TK-9 and TK-10 for storage and pumping to the 311 Tank Farm via the Pipe Trench. Periodically, the uranium solids were scraped off the removable canvas filter cloth into 30-gallon drums. The drums were taken to the 303-K Facility for storage pending off-site shipment for uranium recycle.

**Closure Info:**

Waste Site Reclassification Form 99-016 states that, in 1997, the 313 Uranium Recovery Operation process equipment and piping were removed and the concrete surfaces scabbled and decontaminated. Past practice sub-floor contamination remains to be addressed as well as the potential for some minor RCRA contributions to subfloor contamination. These will be addressed as part of UPR-300-38.

Tanks TK-5, TK-9, TK-10, and the filter press (WIDS Sitecode 313 FP) are shared equipment with the Waste Acid Treatment System (WATS). This equipment was removed under a Decontamination and Inspection Plan for Phase 1 WATS closure activities. Ecology inspected the 313 WATS area in October 1997 and confirmed that the work was completed in accordance with the Phase 1 Plan. All other 313 URO equipment was also removed in 1997.

**This Site Was Consolidated With:**

- **Code:** UPR-300-38
- **Names:** UPR-300-38; 313 Slab; Demolished 313 Building Foundation; Soil Contamination Beneath the 313 Building

**Site Details:**

- **Code:** 313-TK-2
- **Classification:** Accepted
- **Reclassification:** Closed Out (12/6/2001)
- **Start Date:** 1/1/1975
- **End Date:** 1/1/1997
- **Type:** Neutralization Tank
- **Status:** Inactive

**Description:**

This site was Clean Closed under the 300 Area WATS partial closure in 2001. The 313-TK-2 Neutralization Tank was removed in 1997. The tank was part of the 300 Area Waste Acid Treatment System. The vertical, stainless steel, cylindrical tank was located within a bermed area with other uranium recovery and acid treatment equipment.

**Location:**

The tank was installed inside a bermed area near the southwest interior corner of the 313 Building.

**Related Sites/Structures:**

Structures associated with this site include 334-A Building Tank Farm, the 311 Tank Farm, Tanks 311-TK-40 and 311-TK-50, the 313 Uranium Recovery Room, the 313-Centrifuge, the 303-F Facility, and the Pipe Trench (300-224), all of which are components of the 300 Area Waste Acid Treatment System.
Process Description: From 1973 to 1988, Tank 313-TK-2 was used to neutralize chemical waste acid solutions with sodium hydroxide (caustic). The waste acid originated in zircaloy etching tanks in the 333 Building fuels fabrication process which was periodically batched out to spent acid storage tanks in the 334-A Facility. The waste acid was pumped through transfer lines (300-219) in the Pipe Trench (300-224) to Tank 313-TK-2 for neutralization. The neutralized etch waste in 313-TK-2 was pumped in piping via the Pipe Trench to Tank 311-TK-40 in the 311 Tank Farm.

Closure Info: Waste Site Reclassification form 2001-104 documents this site has been Clean Closed.

"Partial closure activities for the 300 Area Waste Acid Treatment System (300 Area WATS) are now complete. The attached certification statement was prepared in accordance with WAC 173-303-610 (6) to independently certify that the 300 Area WATS partial closure activities were performed in accordance with the approved 300 Area Waste Acid Treatment System Closure Plan (DOE/RL-90-11, Rev 2, dated May 1999). This closure plan is considered approved by the Washington State Department of Ecology through Ecology acceptance of the plan as complete in a letter dated July 27, 1999 and because the plan underwent public review without comment. Partial closure activities included the activities necessary to clean close all 300 Area WATS aboveground structures and components and most soils. Not all soil potentially contaminated by WATS operations could be clean closed at the time of partial closure. The December 3, 2001, DOE Partial Closure Certification noted that "The unclosed locations include two areas of potential soil contamination from 300 Area WATS operations that are defined in the closure plan. These areas will remain unclosed and RCRA regulated until soil disposition in conjunction with the future 300-FF-2 CERCLA OU remedial action that will complete 300 WATS closure."

A RCRA closure plan was issued in 1990 for the 300 Area Waste Acid Treatment System which included the Uranium Recovery Operations in the 313 Building. Revision 1 of the RCRA closure plan was submitted to Ecology in March 1996. Tank 313-TK-2 was removed in 1997 in accordance with the Decontamination and Inspection Plan for Phase 1 closure of the 300 Area Waste Acid Treatment System. Ecology inspected the cleanup site in October 1997 and concurred that the work was done in accordance with the D Phase 1 plan.

Code: 315 RSDF
Names: 315 RSDF; 315 Retired Sanitary Drain Field
Type: Drain/Tile Field
Status: Inactive
Description: The 315 RSDF is an abandoned septic tank and drain field. The location shown by maps and drawings is not marked in the field. The site is covered with a surface of gravel and cobbles and no vegetation. There are manhole covers with protective posts located in close proximity to the abandoned septic tank/drain field.
Location: The site is located in the eastern portion of the 300 Area, northeast of the 315 Water Filter Plant.
Related Sites/Structures: The site was associated with the 315 Water Filter Plant Sanitary Sewer.
Process Description: The 315 RSDF received sanitary waste that originated in the 315 Water Filter Plant.

Code: 323 TANK 1
Names: 323 TANK 1; 321 Building Underground Waste
Classification: Accepted
Reclassification: Rejected (7/15/2013)
Tanks; 321 Tank Farm #3; 323 Tank 1

Type: Storage Tank  
Status: Inactive

Start Date: 1/1/1944  
End Date:

Description: The waste site was reclassified to Rejected. The four, underground 323 tanks have been removed. The underlying soils were addressed in the UPR-300-4 closure documentation. The tank was a carbon steel horizontal tank buried with three other identical tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958.

Location: The site was located beneath the 323 Building, in the west central portion of the 300 Area.

Release Description: According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes. Analyses of liquid and sludge samples from Tank 4 in 1987 reported uranium and aluminum in significant quantities. These contaminants would have been introduced during the period the tanks were used to support the 321 Building chemical process development operations prior to 1967. The source of reports that thorium was associated with the waste in the underground waste tanks may have been with reference to the disposal of lab waste solutions from the 3706 Building. In 1944, the "hot" sinks in the 321 Building laboratories were connected to the underground tanks to eliminate sources of fission activity and product contamination of the 300 Area pond. At the same time, it was planned to dispose of active waste from the 3706 laboratories by collecting the wastes in individual containers and emptying them into the "hot" sinks in the 321 Building. Thorium was used during process development tests in the 3706 Building laboratories. According to operating personnel contacted, thorium was not used in the 321 Building process development tests.

Related Sites/Structures: The tank is associated with three other identical tanks in the same concrete encasement, the 323 Building (formerly the 321-A Building), the 321 Building, and the 3706 Building labs by way of the hot sink drains in the 321 Building labs.

Process Description: The carbon steel tank received neutralized uranium-bearing process waste and/or basic aluminum cladding contaminated waste solutions from the 321 Building, primarily from cold and hot pilot tests for the bismuth phosphate chemical separations process from 1944 to about 1946. Some neutralized uranium-bearing waste solutions were received from the 321 Building Tank Farm during the pilot plant tests for the REDOX process. Lesser quantities of process wastes containing fission products, uranium, plutonium, and laboratory chemicals were routed to the tank from the "hot sinks" in the 321 Building laboratories from 1944 to about 1954 during the development of the Bismuth Phosphate, Redox, Uranium Metal Recovery, PUREX, RECUPLEX, and Thorex processes and from lab scale tests on medical isotope extraction processes. Beginning in late 1944, "hot" wastes from the 3706 Building laboratories were carried to the 321 Building for disposal via the "hot sinks" to prevent contamination of the 300 Area Ponds.

Closure Info: The above grade portions of the 323 building were demolished in 2008. Demolition of the below grade structures, including the 323 tanks (1 through 4), was deferred to the adjacent UPR-300-4 remediation. During the site characterization, the four tanks were found to be filled with water. After sampling the water, approximately 100,000 gallons of water was pumped out of the four tanks and taken to the 200 Area Effluent Treatment Facility.

The four 323 tanks and the underground piping connected to the 321 building was remediated in November 2012.

**Hanford Site Waste Management Units Report**

February 2015

---

2040
Inactive

The waste site was reclassified to Rejected. The four, underground 323 tanks have been removed. The underlying soils were addressed in the UPR-300-4 closure documentation. The tank was a carbon steel horizontal tank buried with three other identical tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958.

The site was located beneath the 323 Building, in the western portion of the 300 Area.

According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes. The source of reports that thorium was associated with the waste in the underground waste tanks may have been with reference to the disposal of lab waste solutions from the 3706 Building. In 1944, the "hot" sinks in the 321 Building laboratories were connected to the underground tanks to eliminate sources of fission activity and product contamination of the 300 Area pond. At the same time, it was planned to dispose of active waste from the 3706 laboratories by collecting the wastes in individual containers and emptying them into the "hot" sinks in the 321 Building. Thorium was used during process development tests in the 3706 Building laboratories. According to operating personnel contacted, thorium was not used in the 321 Building process development tests.

The tank is associated with the 323 Building, the 321 Building, and the 3706 Building by way of the 321 Building hot sink drains.

The carbon steel tank received neutralized uranium-bearing process waste and/or basic aluminum cladding contaminated waste solutions from the 321 Building, primarily from pilot tests for the bismuth phosphate chemical separations process from 1944 to about 1946. Some neutralized uranium-bearing waste solutions were received from the 321 Building Tank Farm during the pilot plant tests for the REDOX process. Lesser quantities of process wastes containing fission products, uranium, plutonium, and laboratory chemicals were routed to the tank from the "hot sinks" in the 321 Building laboratories from 1944 to about 1954 during the development of the Bismuth Phosphate, Redox, Uranium Metal Recovery, PUREX, RECUPLEX, and Thorox processes and from lab scale tests on medical isotope extraction processes. Beginning in late 1944, "hot" wastes from the 3706 Building laboratories were carried to the 321 Building for disposal via the "hot sinks" to prevent contamination of the 300 Area Ponds.

The above grade portions of the 323 building were demolished in 2008. Demolition of the below grade structures, including the 323 tanks (1 through 4), was deferred to the adjacent UPR-300-4 remediation. During the site characterization, the four tanks were found to be filled with water. After sampling the water, approximately 100,000 gallons of water was pumped out of the four tanks and taken to the 200 Area Effluent Treatment Facility.

The four 323 tanks and the underground piping connected to the 321 building was remediated in November 2012.

323 TANK 4
323 TANK 4; 321 Building Underground Waste Tanks; 321 Tank Farm #3; 323 Tank 4
Storage Tank
Inactive
Start Date: 1/1/1944
End Date: 1/1/1987
The waste site was reclassified to Rejected. The four, underground 323 tanks have been removed. The underlying soils were addressed in the UPR-300-4 closure documentation. The
tank was a carbon steel horizontal tank buried with three other identical tanks encased in a large block of concrete. The top of the concrete block was used as the floor for the installation of the 323 Building (lower level) in 1958.

**Location:**
The underground tank had been located beneath the 323 Building, in the western portion of the 300 Area.

**Release Description:**
According to BHI-00012, contamination in the soil surrounding the four tanks is possible. According to WHC-MR-0388, the soil around and beneath the four tanks and the tanks themselves are very contaminated with mixed wastes.

**Related Sites/Structures:**
The tank is associated with the 321 Building and the process sewer. It is also associated with the 323 hot cell, the cleanup box and the process water sump.

**Process Description:**
Between 1944 and 1945, the tank received neutralized uranium-bearing wastes from cold and hot bismuth phosphate pilot tests in the 321 building. Between 1945 and 1953, the tank received neutralized uranium-contaminated water and/or basic aluminum cladding waste solutions from reprocessing research and development activities in the 321 Building and the 3706 Building (via the hot sink drains in the 321 Building laboratories), including those related to bismuth phosphate chemical separations, REDOX, Uranium Metal Recovery, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. Between 1945 and 1953, the tank may have received uranium-contaminated water and acid solutions from reprocessing research and development activities in the 321 Building, including those related to bismuth phosphate chemical separations, REDOX, PUREX, RECUPLEX, the Thorex program, and medical isotope extraction. Between 1968 and 1987, the tank received waste from the 323 Building, including the hot cell drain, the cleanup box drain and overflow from the process water sump. The tank has not received waste since 1987.

**Closure Info:**
The above grade portions of the 323 building were demolished in 2008. Demolition of the below grade structures, including the 323 tanks (1 through 4), was deferred to the adjacent UPR-300-4 remediation. During the site characterization, the four tanks were found to be filled with water. After sampling the water, approximately 100,000 gallons of water was pumped out of the four tanks and taken to the 200 Area Effluent Treatment Facility.

The four 323 tanks and the underground piping connected to the 321 building was remediated in November 2012.

| Code:  | 325 WTF                        | Classification: Accepted |
| Names: | 325 WTF; 325 Hazardous Waste Treatment Units; 325 Waste Treatment Facility | Reclassification: None |
| Type:  | Process Unit/Plant             | Start Date: 1/1/1953    |
| Status:| Active                         | End Date:              |
| Description: | The 325 Waste Treatment Facilities (WTF) is an active TSD unit located inside the 325 building. It consists of two sections. The first section is the shielded analytical laboratory located in Rooms 32, 200, 201, 201A, 202, and 203. The second section includes the hazardous waste treatment units, located in Rooms 520, 527A, and 528. |
| Location: | The 325 Waste Treatment Facilities are located in the 325 Building. The shielded analytical laboratory is located on the west side of the 325 Building. The hazardous waste treatment unit is located on the northeast side of the 325 Building. |
| Related Sites/Structures: | Structures associated with this unit include other 325 Laboratories, the 300 Area Process Sewer, 300 Area Radioactive Liquid Waste Sewer, the Physical and Chemical Treatment Test Facilities, the Thermal Treatment Test Facilities, and the Biological Treatment Test Facilities. |
Process Description: Mixed waste treatment in the shielded analytical laboratory includes the following processes: pH adjustment, ion exchange, evaporation, precipitation and solvent extraction, solids washing, phase separation, and solidification. The shielded analytical laboratory processes are conducted as small, bench-scale operations. Treatment processes conducted in the hazardous waste treatment units include: pH adjustment, ion exchange, carbon absorption, oxidation/reduction, evaporation, precipitation/filtration, phase separation, catalytic destruction, and solidification.

Code: 331-C HWSA Classification: Accepted
Names: 331-C HWSA; 331-C Low Level Radioactive Storage Area; 331-C Hazardous Waste Storage Area
Type: Storage Pad (<90 day) Start Date: 1/1/1972
Status: Inactive End Date: 1/1/1996
Description: The former 331-C HWSA is now a steel building and fenced laydown yard that is currently in use as a refrigeration maintenance shop, material storage area, laydown yard and radioactive waste storage area. The 331-C building is divided into three sections. The southern portion of the 331-C building is currently empty. The mid section of the building is in use as an equipment and material storage area. The northern portion of the building is in use as a refrigeration maintenance shop. The maintenance shop contains a satellite accumulation area for the storage of used oil [less than 208 liters (55 gallons)]. On the east side of the building, a radioactive waste storage area was observed under the roofed area. In addition, several 208 liter (55 gallon) drums of propylene glycol was stored under the roofed area. The fenced laydown area contains equipment.
Location: The 331-C HWSA was located approximately 100 meters south of the 331 building inside 331-C, and in the storage yard on the east side of 331-C.
Release Description: No known spills or releases have been reported from this site.
Related Sites/Structures: The unit was related to the research and development activities in the 331 Complex.
Process Description: The 90-day storage pad was originally set up under RCRA for the management of hazardous waste generated from animal research in the 331 complex. In the late 1960's, 1500 dogs were exposed to either strontium-90 or radium-226. As the dogs died, their bones and tissues were tested for the movement and accumulation of isotopes. All bones and tissues were preserved in ethanol and saved for 30 years.

Code: 332 SF Classification: Accepted
Names: 332 SF; 332 Storage Facility; 332 Hazardous Waste Storage Area; 332 Interim Holding Facility; 332 Packaging Test Facility
Type: Storage Start Date: 1/1/1984
Status: Inactive End Date: 1/1/1997
Description: The 332 Storage Facility was procedurally Closed in 1997. It was constructed as a less than 90 day storage facility. In late 1989 or early 1990, the chemicals stored in the 332 facility were removed. The building was used only for the testing of Department of Transportation (DOT) containers. The procedural TSD closure of the 332 Storage Facility was approved by the Washington State Department of Ecology on April 21, 1997.
Location: The building is located north of the 300 Area Sanitary Trenches (300-52) and east of 618-2.

Closure Info: Reclassification form 98-062 states "A letter was issued in 1989 requesting the Part A application for the 332 Storage Facility be withdrawn. The procedural closure of the 332 Storage Facility was approved by the Washington State Department of Ecology on April 21, 1997. A letter from the Washington State Department of Ecology, that approves closure of this TSD, is available through the Administrative Record, #0047389. No signature is required for this form."

The certification package submitted in 1989 provided verification of documentation that the operations covered by the existing Part A, Form 3 did not meet the definition of a treatment, storage and/or disposal (TSD) facility as defined in the Resource Conservation and Recovery Act (RCRA) or the State of Washington Dangerous Waste Regulations (WAC). RL has reviewed the records and activities which have occurred in the 332 Storage Facility since 1989 and has found no evidence to conclude, or suggest, that this facility was used in a manner constituting "treatment, storage, and/or disposal" as defined by regulations promulgated under either the WAC, or the RCRA.

| Code: 333 ESHTSSA | Classification: Accepted |
| Names: 333 ESHTSSA; 333 East Side Heat Treat Salt Storage Area | Reclassification: Consolidated (2/12/1999) |
| Type: Storage | Start Date: 1/1/1964 |
| Status: Inactive | End Date: 1/1/1987 |
| Description: This waste site has been incorporated (consolidated) into the 618-1 Burial Ground waste site. This waste site is also "subsite" 618-1:1. It was Interim Closed Out with the 618-1 Burial Ground. |

The 333 ESHTSSA is an inactive storage area. The site included various locations inside the 333 fence where heat-treat salts were stored. It is now an open paved area near the southeast corner of the 333 Building. Several areas of the asphalt pavement have been painted over and posted fixed radiological contamination (WIDS Site UPR-300-17).

Location: The site includes waste stored in the fenced area east of the 333 Building in the northern part of the 300 Area. The heat-treat salts were stored on the paved area near the southeast corner of the building or in the adjacent area located over a portion of the 618-1 Burial Ground.

Related Sites/Structures: The site is associated with operations in the 333 Building. The site is also associated with the 618-1 Burial Ground since it is located adjacent to and possibly over the southwest corner of the Burial Ground.

Process Description: The site was used to store containers of solidified heat-treat salt waste from the fuels fabrication facility.

This Site Was Consolidated With:

Code: 618-1
Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

| Code: 333 LHWSA | Classification: Accepted |
| Names: 333 LHWSA; 333 Laydown Hazardous Waste Storage Area; 333 Laydown HWSA | Reclassification: Consolidated (2/12/1999) |

Hanford Site Waste Management Units Report
February 2015

2044
Storage Pad (<90 day)  Start Date: 1/1/1971

Status: Inactive  End Date:

Description: This waste site has been consolidated into the 618-1 Burial Ground waste site. The 333 LHWSA is a concrete and asphalt pad on the east side of the 333 Building. The unit is within the 333 Building fence, and a second locked fence surrounds the unit. The white conex box in this unit is the location of the present 90-day waste storage area. Currently this conex box is empty. The yellow boxes on the opposite side of the area contain low level radioactive waste.

Location: The unit is located east of the 333 Building, within the fence of the 333 Building. The 333 Building is in the northern part of the 300 Area.

Related Sites/Structures: The unit is related to the 333 Building Operations. This site is located over the 618-1 Burial Ground.

Process Description: The area inside the fence was originally a material laydown area. Now this area contains wastes that are segregated into a 90-Day Storage Pad for hazardous wastes and a Radioactive Material Area for low level radioactive waste.

This Site Was Consolidated With:
Code: 618-1
Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

Type: Storage Tank  Start Date: 1/1/1972

Status: Inactive  End Date:

Description: This site has been remediated and Interim Closed Out. In 2014, the site was reclassified to Final Closed Out. It was an above grade tank farm containing three cylindrical tanks that stand upright within a concrete containment basin. The containment basin was attached to the outside wall of the 333 Building. One of the tanks was labeled "Non Contaminated Waste Oil - Flashpoint 455 degrees F." The two other tanks were labeled "Uranium bearing acid." The concrete containment basin was 6 meters (19.7 feet) by 4.2 meters (13.8 feet) with a depth of 0.4 meters (1.3 feet). Asphalt pavement surrounded the basin and the west side of the building. On this pavement there is a sign posting fixed radioactive contamination.

Location: The tank farm was located on the west side of the 333 Building, in the northern part of the 300 Area.

Related Sites/Structures: The tanks are associated with operations in the 333 Building.

Process Description: The 300 Area WATS began partial operations in January 1973 with tank storage and treatment of waste acid and entered full operations in 1975. The primary source of the waste acid was N Reactor fuel fabrication operations that occurred in tanks in the 333 Building from 1961 until 1987. The waste acids from these operations that contained nonrecoverable uranium were treated in the 300 Area WATS. Because this acid waste contained small amounts of uranium, the waste is considered to have been a mixed waste entering the 300 Area WATS. The 300 Area WATS permanently ceased operations in 1995. Partial clean closure activities for this unit began in 1996 and were completed in September 1999. Clean closure activities occurred in three phases, in accordance with the approved clean closure plan and the requirements of Part.
V, Chapter 20, of the Hanford Facility RCRA Permit. RCRA Clean closure was achieved for all 300 Area WATS locations and components in October 2005.

The Waste Oil Tank temporarily stored oil from the extrusion press sump prior to shipment off site. When in use the process accumulated between 1892 and 3785 liters per year (500 to 1000 gallons per year). The Uranium Bearing Acid tanks temporarily stored spent acid from the 333 Building uranium acid etch process tanks. The spent acid was pumped from these storage tanks to the Uranium Recovery Operations (WIDS Site 313 URO) process in the 313 Building where the acid was treated for uranium recovery and recycling.

**Closure Info:** Interim

Note that the portions of the WATS trench that were inside the 333 Building and east of the 333 Building are not part RSVP-2011-106 interim closeout document. The portion of the 300-219 and 300-224 waste sites that were in the 618-1 Burial Ground were clean closed as part of the 300 Area WATS Resource Conservation and Recovery Act of 1976 (RCRA) treatment, storage, and disposal unit (TS-3-1). The portions of the 300-219 and 300-224 waste sites addressed in the RSVP-2011-016 document are the portions of the WATS trench from the 313 Building to the 333 Building.

Remediation of the 300-219 and 300-224 waste sites was performed from December 14, 2009, through May 23, 2011. The majority of the soil within the waste sites footprints were excavated to a depth of 0.5 to 1.0 meters (1.6 to 3.3 ft) below ground surface (bgs). The soil under the 300-224 loading area was excavated to a depth of over 1.5 meters (4.9 ft) bgs. Remediation of the 333 WSTF waste site was performed on December 14, 2009. The soil within the waste site footprint was excavated to a depth of 1.0 meter (3.3 ft) bgs, resulting in 40 BCM (52 BCY) of soil being disposed at the ERDF. The resulting 581 bank cubic meters (BCM) (760 bank cubic yards [BCY]) of soil was disposed at the Environmental Restoration Disposal Facility (ERDF).

**Final**

The 300-219 waste site consists of the transfer lines inside the 300-224 Waste Acid Treatment System (WATS) trench. The 300-224 WATS trench ran between the 313 Building, 303-F Building, 311 Tank Farm, 333 Building, 334-A Building, and 334 Tank Farm. The 333 WSTF waste site, located on the west side of the former 333 Building, was an above-grade tank farm with a concrete containment basin. Remediation occurred from 2009 through 2011 with a maximum depth of 4.9 feet. The 300-219, 300-224, and 333 WSTF waste sites were remediated and have been evaluated in accordance with the 300 Area Final Action ROD (EPA 2013) and the 300 Area RDR/RAWP (DOE-RL 2014). Verification sampling results show that the site meets the CULs for direct exposure and groundwater protection and river protection and support an industrial land use scenario. Because the sample results do not meet the CULs for residential land use, the waste sites require institutional controls to maintain industrial land use. In accordance with this evaluation, the verification sampling results support a reclassification of the 300-219, 300-224, and 333 WSTF waste sites to Final Closed Out.

*Hanford Site Waste Management Units Report*

February 2015

2046
Description: The RCRA TSD permit was Closed under the 300 Area Waste Acid Treatment System (WATS) RCRA TSD partial closure. The 333-TK-11 tank was removed in 1998. It was a square uncovered metal tank. The unit was connected to the 300 Area Waste Treatment System by a polyvinyl chloride (PVC) drain line.

Location: The tank was located inside the 333 Building, west of the Pipe Trench.

Related Sites/Structures: The unit was related to the 333 fuel fabrication activities and the 300 Area Waste Acid Treatment System.

Process Description: From 1983 to 1987, Tank 11 was used to treat waste acid by reducing chromium (VI) to chromium (III). The waste acid was drained to the 334-A Facility Storage Tanks.

Closure Info: Waste Site Reclassification Form 2001-105 states "Partial closure activities for the 300 Area Waste Acid Treatment System (300 Area WATS) are now complete. The attached certification statement was prepared in accordance with WAC 173-303-610 (6) to independently certify that the 300 Area WATS partial closure activities were performed in accordance with the approved 300 Area Waste Acid Treatment System Closure Plan (DOE/RL-90-11, Rev 2, dated May 1999). This closure plan is considered approved by the Washington State Department of Ecology through Ecology acceptance of the plan as complete in a letter dated July 27, 1999 and because the plan underwent public review without comment. ...Partial closure activities included the activities necessary to clean close all 300 Area WATS aboveground structures and components and most soils. Not all soil potentially contaminated by WATS operations could be clean closed at the time of partial closure." The December 3, 2001, DOE Partial Closure Certification noted that "The unclosed locations include two areas of potential soil contamination from 300 Area WATS operations that are defined in the closure plan. These areas will remain unclosed and RCRA regulated until soil disposition in conjunction with the future 300-FF-2 CERCLA OU remedial action that will complete 300 WATS closure."

This RCRA TSD site has been Clean Closed. Tank 333-TK-11 was removed in 1998 pursuant to the Phase II Decontamination and Inspection Plan. Ecology inspected the cleanup site in August 1998. Ecology concurred that the work was done to the plan.
The tank was removed pursuant to Phase II of the Decontamination and Inspection Plan. The tank removal site was inspected by Ecology in August, 1998 and written concurrence of the work done was received in September 1998.

Reclassification form 2001-109 documents "Partial closure activities included the activities necessary to clean close all 300 Area WATS aboveground structures and components and most soils. Not all soil potentially contaminated by WATS operations could be clean closed at the time of partial closure. The December 3, 2001, DOE Partial Closure Certification noted that "The unclosed locations include two areas of potential soil contamination from 300 Area WATS operations that are defined in the closure plan. These areas will remain unclosed and RCRA regulated until soil disposition in conjunction with the future 300-FF-2 CERCLA OU remedial action that will complete 300 WATS closure."

<td>Description:</td>
<td>This site RCRA TSD was Clean Closed under the 300 Area WATS partial RCRA TSD closure. The tank was taken out of service in 1986 and removed in 1988. The tank was a 27,710 liter (6000 gallon) Koroseal-lined mild steel tank. It was a vertical cylindrical tank installed on the upper level of the 334 Tank Farm structure, about 8 feet (2.4 meters) above ground level.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Location:</td>
<td>The tank was the north elevated tank in the 334 Tank Farm, located on the east side of the 333 Building.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Release Description:</td>
<td>Unusual Occurrence UO-86-01 states: At about 2200 hours on January 2, 1986, acid was found leaking from the waste acid storage tank (#4) located in the 334 Tank Farm. The leak drained to the process sewer which discharged to the 300 Area process trenches. The waste acid was pumped to another tank and at about 0100 hours on January 3, 1986, 60 gallons of 50 percent caustic was added to the process sewer. The pH meter strip chart for the 333 Building waste water indicated that an unusually low pH first occurred at about 1800 hours and by 0200 hours the pH readings in the waste water stream was back to normal. The pH did not get low enough during the event to trip the pH meter alarm. No acid spilled to the ground; it was all contained within the bermed concrete pad beneath the 334 Tank Farm which drained to the process sewer. Inspection of the tank indicated that the waste acid had corroded through the (Koroseal lined, mild steel) tank in several places about 10 percent down from the top of the tank. The operating staff reported that to the best of their knowledge since Tank 4 was place in service about ten years earlier, it had never been filled the level at which failure occurred until this event.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Related Sites/Structures:</td>
<td>The tank was related to the 334 Tank Farm, the 333 N Fuels zircaloy fuel etching process, the 300 Area Waste Acid Treatment System, and the Process Sewer.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process Description:</td>
<td>Tank 334 TFWAST (TK-4) in the 334 Tank Farm was first used in 1973 to store the waste acid for the 300 Area Waste Acid Treatment System while waste acid storage tanks TK-B and TK-C were installed in the 334-A Building. After that time, TK-4 was used for emergency storage during periods when the acid neutralization equipment in the 313 Building was not in operation. When tank TK-4 was filled in January 1986, a leak developed near the top of the tank. The tank was drained at that time and removed in 1988.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Closure Info: | This site has been Clean Closed under the 300 Area Waste Acid Treatment System (WATS) partial closure. The 334 Tank Farm Waste Acid Storage Tank 4 was removed in 1988. The superstructure which held tank TK-4 will be decontaminated as required during the Phase 3 closure activities for the 300 Area Waste Acid Treatment System. The RCRA Closure Plan for
the 300 Area Waste Acid Treatment System was submitted to Ecology in June 1990; Revision 1 of the closure plan was submitted in March 1996, and Revision 2 in July 1999.

Reclassification form 2001-106 states: "Partial closure activities for the 300 Area Waste Acid Treatment System (300 Area WATS) are now complete. The attached certification statement was prepared in accordance with WAC 173-303-610 (6) to independently certify that the 300 Area WATS partial closure activities were performed in accordance with the approved 300 Area Waste Acid Treatment System Closure Plan (DOE/RL-90-11, Rev 2, dated May 1999). This closure plan is considered approved by the Washington State Department of Ecology through Ecology acceptance of the plan as complete in a letter dated July 27, 1999 and because the plan underwent public review without comment. ...Partial closure activities included the activities necessary to clean close all 300 Area WATS aboveground structures and components and most soils. Not all soil potentially contaminated by WATS operations could be clean closed at the time of partial closure." The December 3, 2001, DOE Partial Closure Certification noted that "The unclosed locations include two areas of potential soil contamination from 300 Area WATS operations that are defined in the closure plan. These areas will remain unclosed and RCRA regulated until soil disposition in conjunction with the future 300-FF-2 CERCLA OU remedial action that will complete 300 WATS closure."

---

**334-A-TK-B**

**Classification:** Accepted

**Names:** 334-A-TK-B; 334-A Waste Acid Storage Tank 1

**Reclassification:** Closed Out (12/6/2001)

**Type:** Storage Tank

**Status:** Inactive

**Start Date:** 1/1/1975

**End Date:** 1/1/1998

**Description:** The RCRA permit for this site was Clean Closed under the 300 Area WATS partial RCRA TSD closure in 2001. The tank was removed in 1998. The horizontal 7570 liter (2000 gallon) tank was a high-density polyethylene tank resting on a steel saddle. The tank was one of three tanks in a 3 meter (10 foot) deep concrete pit below the 334-A Building. A cover has been installed over the pit and the cover sealed.

**Location:** The unit was located in the 334-A Tank Pit, east of the 333 Building.

**Related Sites/Structures:**

- The unit is associated with the 334-A-TK-C, the 334-A Tank Pit, the 334-A Building, the Pipe Trench, the 333 Building etch tanks, the 300 Area Waste Acid Treatment System (WATS), and 300-21.

**Process Description:**

- The tank stored spent etch acid from the 333 Building fuel fabrication process. Spent acid was drained from the 333 Building etch tanks (8 tanks with a total capacity of 7551 liters [1995 gallons]) to Tank 334-A-TK-B via a 10.1 cm (4-inch) diameter PVC line (see 300-219) in the Pipe Trench (see 300-224). The waste acid was stored until treated by the 300 Area Waste Acid Treatment System. The waste acid was pumped via a 5.1 cm. (2-inch) diameter PVC line in the Pipe Trench to the 313-TK-2 neutralization tank in 313 Building. Spills from the tank into the concrete pit were contained and recovered. A spill alarm in the pit alerted operating personnel. No record was found of any contamination released outside the 334-A boundaries.

**Closure Info:** Form 2001-017 documents the reclassification to Closed Out. This site was clean closed under the 300 Area WATS partial closure. Tank TK-B was removed in 1998 as part of the cleanup activities pursuant to the Decontamination and Inspection Plan issued for Closure Phase 2. The cleaned site was inspected by Ecology on August 25, 1998. Ecology verified that the Phase 2 work was performed in accordance with Ecology's "Clean Closure Guidance Document" method of a clean debris surface and later provided final approval of the Phase 2 closure.

---

**334-A-TK-C**

**Classification:** Accepted
### Storage Tank

**Names:** 334-A-TK-C; 334-A Waste Acid Storage Tank 2  
**Reclassification:** Closed Out (12/6/2001)

**Type:** Storage Tank  
**Status:** Inactive  
**Start Date:** 1/1/1975  
**End Date:** 1/1/1998

**Description:** The permit for this site was Clean Closed under the 300 Area WATS partial RCRA TSD closure in 2001. The tank was removed in 1998. The horizontal 7570 liter (2000 gallon) tank was a high-density polyethylene tank resting on a steel saddle. The tank was one of three tanks in a 3 meter (10 foot) deep concrete pit below the 334-A Building. A cover has been installed over the pit and the cover sealed.

**Location:** The unit was located in the 334-A Tank Pit, east of the 333 Building.

**Related Sites/Structures:** The unit is associated with the 334-A-TK-B, the 334-A Tank Pit, the 334-A Building, the Pipe Trench, the 333 Building etch tanks, and the 300 Area Waste Acid Treatment System.

**Process Description:** The tank stored spent etch acid from the 333 Building fuel fabrication process. Spent acid was drained from the 333 Building etch tanks (8 tanks with a total capacity of 7551 liters [1995 gallons]) to Tank 334-A-TK-C via a 10.1 cm (4-inch) diameter PVC line (see 300-219) in the Pipe Trench (see 300-224). The waste acid was stored until treated by the 300 Area Waste Acid Treatment System. The waste acid was pumped via a 5.1 cm. (2-inch) diameter PVC line in the Pipe Trench to the 313-TK-2 neutralization tank in 313 Building. Spills from the tank into the concrete pit were contained and recovered. A spill alarm in the pit alerted operating personnel. No record was found of any contamination released outside the 334-A boundaries.

**Closure Info:** Form 2001-108 documents the reclassification to Closed Out. Tank TK-C was removed in 1998 as part of the cleanup activities pursuant to the Decontamination and Inspection Plan issued for Closure Phase 2. The cleaned site was inspected by Ecology on August 25, 1998. Ecology verified that the Phase 2 work was performed in accordance with Ecology's "Clean Closure Guidance Document" method of a clean debris surface and provided tentative approval of the Phase 2 closure. The site was clean closed as part of the 300 Area WATS partial closure in December 2001.

### Retired Sanitary Drain Field

**Names:** 335 & 336 RSDF; 335 & 336 Retired Sanitary Drain Field  
**Reclassification:** Rejected (2/12/1999)

**Type:** Drain/Tile Field  
**Status:** Inactive  
**Start Date:** 1/1/1973  
**End Date:** 1/1/1978

**Description:** The 335 and 336 RSDF is a below grade waste site consisting of a septic tank and drainfield that were abandoned in place in 1978. In 2012, the drain field was filled with grout. The top three feet were removed in conjunction with the demolition of the 335 and 336 buildings.

**Location:** The site is located south of the southwest corner of the 335 Building.

**Related Sites/Structures:** The site was associated with the 335 and 336 Sanitary Waste Systems. The 335 and 336 Buildings were constructed to house experimental equipment for the study of the properties of sodium and the behavior of mechanical components to be operated in a sodium environment in support of FFTF development (through the late 1970's).

**Process Description:** The unit disposed of sanitary waste generated in the 335 and 336 Buildings.

### CHWSA

**Code:** 340 CHWSA  
**Classification:** Accepted

### 340 CHWSA; 340 Complex Hazardous Waste Storage Area; 340 Complex HW

**Names:** 340 CHWSA; 340 Complex Hazardous Waste Storage Area; 340 Complex HW

**Type:** Storage Pad (<90 day)

**Status:** Inactive

**Description:** According to 340 Complex personnel, hazardous waste was staged for less-than-90-day storage at various locations throughout the 340 Complex yard. This includes a small concrete pad to the northeast of 340B, and the asphalt pad to the west of the 340 Building.

**Location:** Waste was staged at various locations inside the 340 Complex Yard.

**Release Description:** Per Bob Haggard, WMH Environmental Compliance Officer, there is no evidence of an actual or potential for a hazardous substance release.

**Related Sites/Structures:** This storage area staged wastes related to 340 Complex operations.

**Process Description:** Hazardous waste was stored for less than 90 days at various areas throughout the 340 Complex yard.

---

### 350 HW

**Names:** 350 HW; 350-D Hazardous Waste Staging Area; 350 Building Hazardous Waste Storage Area

**Type:** Storage Pad (<90 day)

**Status:** Active

**Description:** The 350 Hazardous Waste Staging Area is inside the 350-D Building and on an asphalt pad in front of the building.

**Location:** The staging area is located in the northeast corner of the fenced 350 Compound.

**Related Sites/Structures:** The unit is associated with the 350 Plant and Operations Facility.

**Process Description:** The staging area is used to temporarily store hazardous wastes. Combustible liquids and PCB containing waste are stored inside the building. Used oil is stored in a 300-gallon (1140-liter) tank behind the 350-D Building. Other waste is stored on the pad in front of the building.

---

### 3712 USSA

**Names:** 3712 USSA; 3712 Building Uranium Scrap Storage Area; 3712 Fuels Warehouse; 3712 Uranium Scrap Storage Area

**Type:** Storage

**Status:** Inactive

**Description:** This site has been remediated and Interim Closed Out. In 2014, the site was reclassified to Final Closed Out. The 3712 USSA was a uranium metal storage unit. The building was a steel frame structure with metal siding and a metal roof and a concrete floor and foundation.

**Location:** The unit was located on the east side of the 313 Building, south of 3720 and west of 306W.
Process Description: The building had been used to store uranium fuel elements, fuel fabrication components, and uranium scraps from the 313 and 333 fuel fabrication efforts.

Closure Info: Interim

Demolition of the above-grade 3712 Building structure was completed in January 2006 and remedial action of the 3712 USSA waste site, including the 3712 Building slab and foundation, was performed between June 3 and 15, 2010. The waste site was excavated to a depth ranging from approximately 1.0 m (3.3 ft) to 1.5 m (4.9 ft) below ground surface, resulting in approximately 999 bank cubic meters (1,307 bank cubic yards) or 2,167 metric tons (2,388 U.S. tons) of building slab and foundation debris and soil disposed at the Environmental Restoration Disposal Facility (ERDF) in the 200 Area of the Hanford Site. All material was direct loaded from the excavation; therefore, no waste staging piles were created. No overburden soil stockpiles are associated with the waste site. A post-excavation radiological survey for gamma and beta activity was conducted following the completion of remedial action to confirm that waste site excavation was complete. No elevated gamma activity was detected nor was elevated beta activity detected. A post-excavation civil survey for the excavation has been completed.

A geophysical investigation was not conducted at the 3712 USSA waste site because the 3712 Building concrete slab was in place at the start of the remediation activities.

Final

The 3712 USSA, Uranium Scrap Storage Area waste site was a metal building built in 1961 and used to store uranium fuel elements, fuel fabrication components, and uranium scraps from the 313 Building and 333 Building fuel fabrication efforts. The 3712 Building was a steel frame structure with metal siding and a metal roof. The building had a concrete floor and foundation. Demolition of the above-grade 3712 Building structure was completed in January 2006 and remedial action of the 3712 USSA waste site, including the 3712 Building slab and foundation, was performed in June 2010. The waste site was excavated from 1.0 meter (3.3 ft) to 1.5 meter (4.9 ft) below ground surface. Verification sampling was conducted on January 31, 2011.

The 3712 USSA waste site were remediated and have been evaluated in accordance with the 300 Area Final Action ROD (EPA 2013) and the RDR/RAWP (DOE-RL 2014). Verification sampling results show that the site meets the CUL's for direct exposure and groundwater protection and river protection and support a residential land use scenario. Contamination at the waste site did not extend into the deep zone (below 4.6 m [15 ft]); therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the verification sampling results support a reclassification of the 3712 USSA waste site to Final Closed Out.

<tr>
<td>Description:</td>
<td>Until 1987, the site was a hazardous waste satellite accumulation area. Today, the site is a concrete pad surrounded by a fiberglass and wood fence. There is a drain in the center of the pad. Items stored in this area include nonhazardous materials, such as ladders, hoses, and pipe.</td>
<td></td>
</tr>
</tbody>
</table>
Currently, the 3713 Building is being used as a carpenter's shop.

**Location:**
The site is outside the southeast door of the 3713 Building.

**Related Sites/Structures:**
The site was associated with the 3713 Paint Shop. The building is now the 3713 Carpentry Shop.

**Process Description:**
The unit was used to temporarily store small quantities of hazardous waste.

---

**Code:** 3713 SSHWSA  
**Classification:** Accepted  
**Names:** 3713 SSHWSA; 3713 Sign Shop Hazardous Waste Satellite Area  
**Reclassification:** Rejected (1/27/1999)  
**Type:** Satellite Accumulation Area  
**Start Date:** 1/1/1984  
**End Date:** 1/1/1987  
**Description:** Until 1987, the site was a hazardous waste satellite accumulation area. It is no longer in existence. No evidence of the satellite accumulation area is apparent.

**Location:** The staging area was located outside the north entrance of the 3713 Building.

**Related Sites/Structures:**
The unit was associated with the 3713 Sign shop. The 3713 Building is currently a carpenter's shop.

**Process Description:**
The staging area accumulated small quantities of nonsolvent waste from sign shop operations.

---

**Code:** 3718-F BS  
**Classification:** Accepted  
**Names:** 3718-F BS; 3718-F Burn Shed  
**Reclassification:** Closed Out (8/1/1998)  
**Type:** Process Pit  
**Start Date:** 1/1/1968  
**End Date:** 1/1/1998  
**Description:**
The site was a component of a Treatment, Storage and Disposal unit that has been Clean Closed. It was a small structure designed to burn waste alkali metals. It was part of the 3718-F Alkali Metal Treatment and Storage Facility TSD Unit. The RCRA TSD has been Closed. The structure has been removed and all that remains is the concrete pad that is shared with other components related to the 3718-F Alkali Metal Treatment and Storage Facility.

The 3718-F Burn Shed was a 3.0-meter by 3.7-meter (10-foot by 12-foot) sheet metal enclosure with a 2.4 meter (8-foot) wide roll-up door. Small stirring ports and windows were placed on the north and west sides. To the east of the burn shed was a fume scrubber through which the gaseous emissions from the burning were processed. The burn shed and fume scrubber were connected by overhead ductwork. The burn shed and fume scrubber were built on a concrete pad. The pad was bermed on the north and south and sloped to the east. A channel on the east side routed any drainage to a floor drain which discharged to the process sewer.

**Location:**
The unit was located in the 300 Area, east of the 324 Building. It shared a common fence with the 3717C, 335, 335A, and 336 Buildings. The burn shed was located on a concrete pad adjacent to the east side of the storage building (3718-F SF).

**Related Sites/Structures:**
The unit is associated with the adjacent fume scrubber, the storage building (3718-F SF), and the treatment tanks (3718-F TT1 and 3718-F TT2).
Process Description: When the facility was used, alkali metals were placed in burn pans, surrounded by fuel, and ignited with a torch inserted through a stirring port. The molten metals were stirred to allow for complete combustion. A water fog was then applied to the metals, completing the oxidation process. Effluents were neutralized and discharged to the process sewer.

Closure Info: All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998. All that remained was the concrete pad.

On February 24, 1998 it was agreed that DOE would perform a voluntary action to remove the drainage sump structure with from which the PCB contaminated sample was taken and to conduct soil sampling in the vicinity of the structure. Initial sampling was performed on March 17, 1998 to determine the levels of PCB's. Cleanup activities occurred between May 1, 1998 and May 6, 1998. During this time, three drain structures were removed. The drain to the process sewer at the northeast corner of the treatment pad was removed and the line connecting to the process sewer was plugged. The two drain sumps for the fume scrubber were removed as a unit because they were connected together with a metal brace. One drain sump was found to be open to soil at the bottom. The two structures were resting on an aluminum plate covered with a white encrustation (later determined to be corroded aluminum). All discolored soil was removed and drummed. Sampling of the drummed soil and the soil beneath the aluminum plate was performed.

The reclassification is documented on forms 98-085, 98-086, 98-087, and 98-088.

<td>1/1/1989</td>
<td>The 3718-F Storage Facility was a component of a Treatment, Storage and Disposal unit that has been Clean Closed. It consisted of a single-story building, an adjoining loading pad, and a concrete treatment pad. It was part of the 3718-F Alkali Metal Treatment and Storage Facility TSD Unit. The RCRA TSD has been Closed Out. The storage building has been removed and all that remains is the concrete pad, which it shared with other sites related to the 3718-F Alkali Metal Treatment and Storage Facility. The 3718-F Storage Facility was designed and constructed in 1968, and redesigned and modified in 1973. The building, which measured 6.1 meters by 14.6 meters (20 feet by 48 feet), was constructed on a concrete pad. The gabled ends, roof, and siding were corrugated steel. The building had electric lights, electric space heaters, and two window air conditioning units. The northern half of the building was used as a storage area and the southern half was used as a work area. A concrete loading pad measuring 3.7 meters by 6.1 meters (12 feet by 20 feet) was located at the south end of the building. The 15-centimeter (6-inch) thick concrete treatment pad measuring 7.2 meters by 14.6 meters (25 feet by 48 feet) adjoined the east side of the building. A burn shed and fume scrubber (3718-F BS) and two treatment tanks (3718-F TT1 and 3718-F TT2) were located on the pad. The north and south ends of the pad are bermed and the pad slopes to the east. Along the east edge is a 7.6-centimeter (3-inch) wide by 7.6 centimeter (3-inch) deep trench. The trench was connected to a floor drain which discharged to the process sewer system. This design was intended to prevent runoff onto the surrounding soils.</td>

the 3717C, 335, 335A, and 336 Buildings.

Related Sites/Structures: The unit was associated with a burn shed and fume scrubber (3718-F BS) and two treatment tanks (3718-F TT1 and 3718-F TT2).

Process Description: The 3718-F Storage Facility was used to store high purity alkali metals and alkali metal alloys to be used in laboratories. Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.

Closure Info: All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998. All that remained was the concrete pad.

On February 24, 1998 it was agreed that DOE would perform a voluntary action to remove the drainage sump structure with from which the PCB contaminated sample was taken and to conduct soil sampling in the vicinity of the structure. Initial sampling was performed on March 17, 1998 to determine the levels of PCB’s. Cleanup activities occurred between May 1, 1998 and May 6, 1998. During this time, three drain structures were removed. The drain to the process sewer at the northeast corner of the treatment pad was removed and the line connecting to the process sewer was plugged. The two drain sumps for the fume scrubber were removed as a unit because they were connected together with a metal brace. One drain sump was found to be open to soil at the bottom. The two structures were resting on an aluminum plate covered with a white encrustation (later determined to be corroded aluminum). All discolored soil was removed and drummed. Sampling of the drummed soil and the soil beneath the aluminum plate was performed.

The reclassification is documented on forms 98-085, 98-086, 98-087, and 98-088.

</tbody>
</table>
Process Description: Equipment contaminated with alkali metals was cleaned in an alcohol bath in the tank. The alcohol bath was used for confined quantities of sodium because the sodium-alcohol reaction was slower and easier to control. The reaction process took up to several days to complete, depending on the amount of sodium on the component and the presence of tight crevices which would minimize the surface area available for reaction. The reaction of the alkali metals with alcohol produced alkoxides, strong organic bases. Alcohols used in this process included methanol, isopropanol, and 2-butoxy ethanol (trade name Dowanol). Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.

Hanford Site Waste Management Units Report
February 2015
Process Description: Equipment contaminated with alkali metals was cleaned in a water bath in the tank. The water was only used for small quantities of unconfined alkali metal because of the violence of the reaction. The reaction produced alkali metal hydroxides. Before 1985, solutions from the treatment tanks were drained onto the concrete pad through a valve in the bottom of the tanks. The spent reagents would flow across the pad to the trough and from the trough to the 300 Area Process Sewer. Beginning in 1985, all spent alcohol solutions were packaged in approved containers and handled as dangerous waste. The used water continued to be drained to the process sewer until 1987 when the use of the treatment tanks was discontinued.

Closure Info: All structures associated with the 3718-F Alkali Metal Treatment Facility were removed during September 1996 and May 1998. All that remained was the concrete pad.

On February 24, 1998 it was agreed that DOE would perform a voluntary action to remove the drainage sump structure with from which the PCB contaminated sample was taken and to conduct soil sampling in the vicinity of the structure. Initial sampling was performed on March 17, 1998 to determine the levels of PCB's. Cleanup activities occurred between May 1, 1998 and May 6, 1998. During this time, three drain structures were removed. The drain to the process sewer at the northeast corner of the treatment pad was removed and the line connecting to the process sewer was plugged. The two drain sumps for the fume scrubber were removed as a unit because they were connected together with a metal brace. One drain sump was found to be open to soil at the bottom. The two structures were resting on an aluminum plate covered with a white encrustation (later determined to be corroded aluminum). All discolored soil was removed and drummed. Sampling of the drummed soil and the soil beneath the aluminum plate was performed.

The reclassification is documented on forms 98-085, 98-086, 98-087, and 98-088.

<td>Description</td>
<td>The 3746-D Silver Recovery unit was removed with the demolition of the 3746D Building in 2006 and disposed of at ERDF. The 3746-D Silver Recovery unit was a piece of equipment located inside the 3746-D Building. The electrolytic portion of the silver recovery unit was present, but the ion exchange columns were not. The recovery unit had been inactive. A large white basin drained into the sanitary sewer system and was the only drain in the building. This drain is not part of the 3746-D Silver Recovery waste site. The unit was located inside the 3746-D Building. The 3746-D Building was on the west side of Alaska Street, next to the 3705 Building.</td>
</tr>
<tr>
<td>Related Sites/Structures</td>
<td>The unit is associated with the 3746-D Building, and the Lockheed Martin Services, Inc. photo-processing operations.</td>
</tr>
<tr>
<td>Process Description</td>
<td>The unit was used to recycle corrosive, silver-bearing photochemical wastes generated by Pacific Northwest National Laboratory Photo Processing Operations. Silver-bearing liquid ran through an electrolytic unit to remove the majority of the silver. The depleted liquid ran through an ion exchange column to remove more silver. From 1984 to 1992, process effluent was discharged to the sanitary sewer. During this time period, the effluent was tested against discharge limits. Until 1992, effluent that was within discharge limits was poured down a sanitary drain. From 1992 through September 1996, effluent was shipped off site. The unit has been inactive since October 1, 1996, when Lockheed Martin Services, Inc., took over</td>

### Drain 2

**Type:** French Drain  
**Start Date:** 1/1/1979

**Status:** Active

**Description:** The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or polyvinyl chloride (PVC) pipe filled with gravel. The above ground portion is a 0.9 meter (3 foot) long, 15.2 centimeter (6 inch) diameter rusted metal pipe capped with a metal plug and surrounded with landscaping rocks and shrubs. The site is not located in a depression or contaminated area.

**Location:** The site is located 3.05 meters (10 feet) south of 4710 Building and 6.1 meters (20 feet) east of that building's southwest corner. It is 7.6 centimeters (3 inch) north of a paved sidewalk.

**Related Sites/Structures:** The site is associated with the 4621E Building.

**Process Description:** The site receives both stormwater runoff and Heating, Ventilation, and Air Conditioning (HVAC) condensate. The HVAC system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit drained to the french drain.

---

**Code:** 400 FD3  
**Classification:** Accepted

**Names:** 400 FD3; 408A East Dump Heat Exchanger Stormwater; Injection Well #03; Miscellaneous Stream #17; 400 Area French Drain 3

**Reclassification:** Rejected (12/15/1998)

**Type:** French Drain  
**Start Date:** 1/1/1979

**Status:** Active

**Description:** The unit is a 1.5-meter (5-feet) long, 1.2-meter (4-foot) diameter concrete or vitrified clay pipe filled with gravel. The above ground portion is two rusty metal pipes. One is 0.61 meters (2 feet) long and 8.9 centimeters (3.5 inches) in diameter. The other is 0.91 meters (3 feet) long and 11.4 centimeters (4.5 inches) in diameter. Each pipe is capped with a metal plug. The unit is surrounded by four 1.2-meter (4-feet) tall yellow metal posts and is in a gravel-covered, vegetation-free field.

**Location:** The site is located 14.6 meters (42 feet) east of the southeast corner of the 408-A East Dump Heat Exchanger (DHX) outside the protected area fence.

---

**Code:** 400 FD4  
**Classification:** Accepted

**Names:** 400 FD4; 491E Heat Transport Building Stormwater and HVAC Condensate; Miscellaneous Stream #18; 400 Area French Drain 4

**Reclassification:** Rejected (12/15/1998)

**Type:** French Drain  
**Start Date:** 1/1/1979

**Status:** Active

**Description:** The unit is a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or vitrified clay pipe filled with gravel. The above ground portion is a 0.91 meter (3 feet) long, 11.4-centimeter (4.5-inch) diameter, rusted metal pipe protruding from the middle of a gravel-covered field. It is surrounded by four 1.2-meter (4-foot) tall yellow metal posts. Each of the posts has had a 20-centimeter (8-inch) diameter PVC (polyvinyl chloride) pipe measuring 2.0 meters (6 feet 8 inches) in length placed over it. The white PVC pipes have been marked with three horizontal, yellow stripes.
**Location:** The site is located approximately 44 meters (144.3 feet) southeast of the 491-E building and approximately 19 meters (62.3 feet) north of the 4713A building.

**Related Sites/Structures:** The site is related to the 491-E Building.

**Process Description:** The site receives both stormwater runoff and Heating, Ventilation, and Air Conditioning (HVAC) condensate. The HVAC system collects condensate from the air on the coils of the unit. The condensate is collected by the HVAC unit and drained to the french drain.

**Start Date:** 1/1/1979

**End Date:**

**Description:** The unit is a 1.2-meter (4-foot) diameter 1.5-meter (5-foot) long concrete or polyvinyl chloride (PVC) pipe filled with gravel and located in a gravel and cobble covered field. The visible portion of the unit is two rusted metal stand pipes. On pipe is 38.1-centimeters (15 inches) tall by 11.4 centimeters (4.5 inches) in diameter and the other is 15.2 centimeters (6 inches) tall by 20.3 centimeters (8 inches) in diameter. Surrounding the unit are two 1.2-meter (4-foot) tall yellow metal posts. Both stand pipes have a metal cap.

**Location:** The site is located 39.6 meters (130 feet) south of the 408-C West Dump Heat Exchanger (DHX) and southwest of the Reactor Containment Building. This location is on the west side of the 491W Heat Transport Building.

**Related Sites/Structures:** The site is related to the 408 South Building and the 491-W Heat Transport Building.

**Process Description:** The site receives both stormwater runoff and heat exchanger condensate from the 491W Heat Transport Building. The heat exchanger system collects condensate from the air on the coils of the unit. The condensate is collected by the heat exchanger unit and drained to the french drain.

**Description:**
- The unit consists of a 1.5-meter (5-foot) long, 1.2-meter (4-foot) diameter concrete or vitrified clay pipe filled with gravel. The above grade structure is a rusted metal stand pipe 12.7 centimeters (5 inches) in diameter and 30.5 centimeters (1 foot) tall. It is located in a vegetation free, gravel covered field, and is surrounded by three 1.2-meter (4-foot) tall yellow steel posts.
- The site is located approximately 39.6 meters (130 feet) north of the 408-C West Dump Heat Exchanger (DHX) and southwest of the 482A/T-58 and 482B/T-87 Water Tanks.
- The site is related to the 481 Pumphouse.
- The french drain is located 12.2 meters (40 feet) west and slightly north of the 482A/T-58 Water Storage Tank.
- The site is associated with the 482A/T-58 Water Storage Tank and the equipment room for this same structure. A similar structure exists for the 482B/T-87 Water Storage Tank. The french drain associated with the 482B/T-87 Water Storage Tank is WIDS Site Code 400 FD10A.

**Location:**
- The french drain is located 12.2 meters (40 feet) west and slightly north of the 482A/T-58 Water Storage Tank.
- The french drain is located 12.2 meters (40 feet) west and slightly north of the 482A/T-58 Water Storage Tank.

**Related Sites/Structures:**
- The site is related to the 481 Pumphouse.
- The french drain is located 12.2 meters (40 feet) west and slightly north of the 482A/T-58 Water Storage Tank.
- The site is associated with the 482A/T-58 Water Storage Tank and the equipment room for this same structure. A similar structure exists for the 482B/T-87 Water Storage Tank. The french drain associated with the 482B/T-87 Water Storage Tank is WIDS Site Code 400 FD10A.

**Process Description:**
- The site is used to receive stormwater runoff from the storage tank and the floor drain located at the base of the steps leading to the equipment room.
Injection Well #10A; Miscellaneous Stream #24; 400 Area French Drain 10A

Type: French Drain  
Status: Active

Description: The site is either a concrete or vitrified clay pipe filled with gravel (H-4-14647). The disposal structure is not visible in the field. The drawing (H-4-14647) states that the drywells shall be located in the field so that they are 12.2 meters (40 feet) minimum from the nearest building line and 3.05 meters (10 feet) minimum from utilities and other structures. The pipe (cast iron soil) invert is to the top of the french drain. Connections (elbows) are made with 45 degree laterals. The top of the french drain is covered by a polyethylene sheet and a 5.1 centimeter (2 inch) thick redwood or cedar wooden cover. The feed pipe is a 10.2 centimeter (4 inch) diameter steel pipe (drain line) with metal grate cover that is flush with the surrounding concrete paved area. The feed pipe drain is located at the base of a set of concrete steps leading to the equipment room for the 482B/T-87 Water Storage Tank. The Water Storage Tank is a concrete structure with a subgrade equipment room and concrete steps leading to the equipment room.

Location: The french drain is located 6.4 meters (21 feet) northwest of the 482B/T-87 Water Storage Tank.

Related Sites/Structures: The site is associated with the 482B/T-87 Water Storage Tank and the equipment room for this same structure. A similar structure exists for the 482A/T-58 Water Storage Tank. The french drain associated with the 482A/T-58 Water Storage Tank is WIDS Site Code 400 FD10.

Process Description: The site is used to receive stormwater runoff from the storage tank and the floor drain located at the base of the steps leading to the equipment room.

Code: 400 PPSS
Names: 400 PPSS; 4608 Percolation Pond; 4608B Control Structure and Process Sewer Sampling Site; 4904 Process Sewer Main; 4904 Process Sewer System; 400 Area Process Pond and Sewer System
Type: Pond  
Status: Active

Description: This site is the 400 Area Secondary Cooling Water (400 Area Process Sewer). The unit consists of underground piping, a control structure, and two percolation ponds known as 4608B and 4608C. The control structure, located near the 4607 Sanitary Sewer septic tank, is a corrugated metal building. A 30.5 centimeter (12 inch) main pipeline carries effluent from the 400 Area to the control structure, then northeast to the percolation ponds. Five 15.2 centimeter (6 inch) diameter pipes discharge process water from the four contributing facilities (see Process Description) into the main pipe (two pipes from FMEF, and one pipe each from the other three facilities). The ponds are 30.5 meters (100 feet) long, 15.3 meters or 23 meters (50 feet or 75 feet) wide, and 1.2 meters (4 feet) deep. The process sewer pipeline empties into a diversion box that is built into the wall that separates the two ponds. Each pond is connected to the diversion box by a 35.6 centimeter (14 inch) vitrified clay pipe. The ponds are enclosed by an 2.4 meter (8 foot) chain-link fence that has an unlocked, open gate. Each pond appears as a vegetation covered area that is recessed 1.2 to 1.8 meters (4 to 6 feet). The sampling location for the process sewer is contained in the flow metering hut (4608B) located just north of the northern fence line of the 400 Area. The following is a list of source contributors and their status. Numbering/naming conventions, e.g., FMEF-352, 36B, 4M-92-00240/M are specific to
facility locations, systems, and Engineering Change Notice/Work Package within the FFTF Complex. Note that some of the original source contributors have been plugged or bermed to prevent cooling water from entering the process sewer. 15 Floor Drain - FMEF-404 36B system drain plugged. 16 Floor Drain - FMEF-238 36B system drain plugged. 17 Floor Drain - FMEF Routed to 36B system. 18 Floor Drain - FMEF-307 36B system drain plugged. 19 Floor Drain - FMEF Routed to 36B system. 20 Floor Drain - FMEF Routed to 36B system. 21 Floor Drain - FMEF 36B system drain plugged. 22 Floor Drain - FMEF Routed to 36B system. 23 Floor Drain - FMEF 36B system plugged by 4M-92-00240/M. 24 Floor Drain - FMEF-204 36B system plugged by 4M-92-00240/M. 25 Floor Drain - FMEF-206 36B system plugged by 4M-92-00240/M. 26 Floor Drain - FMEF Routed to 36B system. 27 Floor Drain - FMEF Routed to 36B system. 28 Floor Drain - FMEF-300 36B system plugged by 4M-92-00240/M. 29-42 Floor Drain - FMEF-352 36B system plugged by 4M-92-00240/M. 44-47 Floor Drain - FMEF Bermed to prevent spills from discharging to process sewer. 49-51 Floor Drain - FMEF Bermed to prevent spills from discharging to process sewer. 60 Equipment Drain Bermed to prevent spills from discharging to process sewer. 62 Floor Drain 0 MASF-HB Drain has been permanently plugged. 63 Floor Drain - MASF-HB Bermed to prevent spills from discharging to process sewer. 64 Air Compressor Cooling Water - MASF-ER Bermed under 4A-92-00065/W. 65 Equipment Drain - MASF-ER Bermed under 4A-92-00065/W. 66 Floor Drain in 481-A A rubber plug has been installed on the drain cover under 4F-92-00940/W. 67 Sanitary Water Pump Leakage - 481-A Drains service pump seal; 4 inch collars have been installed. 68 Equipment Drain - 481-A Drains service pump seal; 4 inch collars have been installed. 69 Equipment Drain - 481-A Drains service pump seal; 4 inch collars have been installed. 70 Janitor Sink - 481-A Drains service pump seal; 4 inch collars have been installed.  

Location: The site is located approximately 610 meters (2000 feet) north, northeast of the 400 Area.

Related Sites/Structures: Primarily, the site is associated with underground piping (known as the 4904 Process Sewer System), 4608-B Control Structure and Process Sewer Sampling Station, and two percolation ponds (4608-B and 4608-C).

Process Description: There are four facilities in the 400 Area that contribute to the 400 Area Secondary Cooling Water (400 Area Process Sewer). Fast Flux Test Facility (FFTF) The FFTF is a sodium-cooled test reactor that was used for nuclear research. The reactor's high neutron flux level and neutron energies allowed accelerated testing of fuels and materials. The reactor operated from 1980 to April 1, 1990, when it was ordered into standby status by the U. S. Department of Energy (DOE). In a December 15, 1993 memorandum, the DOE directed its Richland Operations Office to initiate action to place the FFTF in a radiologically and industrially safe shutdown condition. The processes that contribute to the 400 Area Process Sewer are the auxiliary system cooling towers and a batch discharge. The cooling towers reduce the heat generated in the equipment supporting the FFTF auxiliary systems. There is no contact between the piping of the cooling towers and any radioactive liquid, waste, or nuclear materials in the reactor. Adjacent to the cooling tower pad is a building containing water treatment equipment, water quality monitoring instrumentation, and process control for blowdown valves associated with the cooling towers. This system is adjacent to the reactor containment and service buildings within the 400 Area Property Protection Area. Fuels And Materials Examination Facility (FMEF) The FMEF was designed and constructed as a secure, multistoried structure with the capability of handling low and high exposure radioactive materials. Because of program and funding changes, most of the specialized equipment was never installed and radioactive material has never been introduced into the FMEF. The FMEF currently is used for administrative offices. The processes that contribute to the 400 Area Process Sewer are the auxiliary systems cooling towers and batch discharges from the 36B system and the 36D system. Originally, the 36D system was intended to contain radioactive waste. However, with the change in mission for the FMEF, this system has not been used for holding radioactive waste. Engineering documents have been formally changed to reflect the correct status of the 36D system. The cooling system at the FMEF is also a non-contact cooling water system similar to the unit for the FFTF. Maintenance and Storage Facility (MASF) The
MASF, located in the 400 Area Property Protection Area, consists of a main building and a two story service wing. The purpose of MASF is to provide maintenance, repair, and storage areas for radioactive and/or specialized maintenance equipment used in support of the FFTF or other onsite activities. The contributors to the 400 Area Process Sewer are floor and equipment drains located in the bay area. Batch discharges from the large diameter cleaning vessel (LDCV) and bearing cooling water from mitigation pump test runs also are discharged to the process sewer. 481-A Water Pumphouse The 481-A Water Pumphouse was constructed to provide space for a diesel driven fire pump and two sanitary water pumps. An equipment drain associated with sanitary water pump packing leakage contributes to the 400 Area Secondary Cooling Water. The discharges for each facility are described below.

Fast Flux Text Facility (FFTF) The FFTF has one continuous discharge from the cooling towers, which is non-contact cooling water, and one batch discharge, which is condensate from the heating and ventilation (H&V) units. The cooling tower continuous stream is composed of tower sump blowdown (for conductivity control) and sump overflow. The cooling towers provide cooling to the Cooling Water System, which in turn provides cooling to the following various auxiliary systems, incontainment chill water system, excontainment chill water system, radioactive argon processing system and contaminated air processing system, Mobiltherm lite cooling system, and the liquid rheostat cooling system. These auxiliary cooling systems, cool systems that directly support operation of the reactor plant, and the interim decay and storage (IDS) vessel and are explained in greater detail in the following. A portion of the sodium contained in the reactor vessel is routed to a cold trap (CT), through the reactor overflow line (part of the reactor sodium level control system), for removal of impurities. The CT is cooled by a sodium potassium eutectic metal (NaK) system that, in turn, is cooled by an oil system containing Mobiltherm lite oil. The Mobiltherm cooling system is cooled by the Cooling Water System. The Mobiltherm cooling system has been drained of oil and the oil has been removed from the site. Cooling water is blocked from the Mobiltherm/cooling water heat exchanger by closed valves. This portion of the cooling water system is no longer active. The reactor is cooled by three liquid sodium loops with each loop consisting of a primary and a secondary loop. Each primary and secondary loop contains a main circulating pump to provide motive force for the liquid sodium coolant. Each pump has a liquid rheostat in series with the field windings to control the speed of the pump. The liquid rheostat contains sodium carbonate (3,407 liters) in a 2 to 3 percent weight solution. Because of the heat generated in the rheostat, the sodium carbonate solution must be cooled. Cooling water is applied to a liquid rheostat/cooling water heat exchanger (one per rheostat) to remove the heat generated during operation. The rheostats are located in air atmosphere cells in the heat transport buildings of FFTF. The rheostats do not come into contact with any form of radioactive contamination or field. The IDS vessel contains liquid sodium that is circulated to remove the decay heat from expended fuel elements stored in the vessel. The sodium loop is cooled by the NaK loop, which in turn is cooled by a Mobiltherm cooling system. The Mobiltherm cooling system has been drained of oil and the oil has been removed from the site. Cooling water is blocked from the Mobiltherm/cooling water heat exchanger by closed valves. This portion of the cooling water system is no longer active. The radioactive argon processing system (RAPS) processes radioactive argon used as cover gas for the reactor. The contaminated air processing system (CAPS) processes the inert gas (nitrogen) used in cells that contained primary system sodium. The RAPS and CAPS compressors are cooled by the RAPS and CAPS cooling water system. This system removes the heat of compression and motor heat from the compressors. The RAPS and CAPS cooling water system is cooled by the Cooling Water System through the RAPS and CAPS/cooling water heat exchanger. The RAPS and CAPS cooling water system has been shut down, although the system still contains the ethylene glycol/water solution. The inert cells containing primary sodium coolant are cooled by inert gas blowers. The blowers take a suction on the inert cells and discharge the gas through a heat exchanger and return the gas to the cell. Incontainment chill water cools the inert gas blowers, using an ethylene glycol solution. The chill water is 'chilled' by use of Freon cycle chillers. The chillers are cooled by the cooling water system. The cells outside of containment are cooled by various H&V units. The H&V units are cooled by excontainment chill water using an ethylene glycol solution. The chill water is 'chilled' by...
use of Freon cycle chillers. The chillers are cooled by the cooling water system. All the cooling water systems (A-G) contain a 40 percent solution of ethylene glycol that is routed to the cooling towers. The cooling towers are galvanized steel, closed-loop evaporation cooling through cooling coils in the cooling towers. Water is sprayed over the coils as air is blown up through the cooling coils to the recirculated ethylene glycol solution. The eight cooling towers each have a sump capacity of 7,570 liters (2,000 gallons). The water in the cooling tower sumps is treated chemically with a biocide (Dearborn 702), a microbicide (sodium hypochlorite), and a scale inhibitor (Dearborn 878). Scale formation is created by the increasing concentration of naturally occurring salts (typically calcium carbonate) resulting from the evaporation process of the cooling towers. The electrical conductivity of the water in the sumps is monitored and when the conductivity approaches 1,200 micromhos, automatic valves open to discharge water. This allows the addition of fresh water to lower the conductivity to approximately 900 micromhos.

Fuel and Materials Examination Facility (FMEF) The FMEF has four routine contributors, three discharges from the FMEF cooling towers and one from the pressure relief valve drain to the process water supply system in the mechanical contributors, 36B system and the 36D system. The 36D system originally was intended to contain radioactive waste. However, with the change in mission for the FMEF, this system has not been used for its intended purpose. Waste water from the fire testing system and a lunchroom sink are the only discharges to the 36D system. Both systems contain two 22,712 liter tanks, the 36B system tanks are fiberglass and the 36D system tanks are stainless steel. Both systems have overflow systems and recirculating lines. The 36B system can discharge to either the process sewer or the 36D system. A computer automatically shifts valves to the other tank when one tank is full. At this time, a technician secures a sample from the full tank and the sample is analyzed as required in the sampling and analysis plan. With approval of the analysis results, 12,113 liters (maximum of the pumping system) are discharged to the process sewer. The 36D system operates similar to the 36B system except the contents only can be sent to the liquid waste loadout room. Presently, a fire hose is connected to the line in the liquid waste loadout room and the contents are sent to the barrel washer pad, which is connected to the process sewer. Each system would discharge no more than once every three months. The three cooling towers at the FMEF are identical to the cooling towers located at the FFTF and are operated under the same conditions. The same Dearborn chemicals are added to the water in the FFTF and FMEF cooling towers.

Maintenance and Storage Facility (MASF) The MASF has one routine contributor to the process sewer from the process equipment room air compressor. Two infrequent contributors are from the LDCV and bearing cooling water from mitigation pump test runs. These vessels currently are being used for the testing of new pumps. Water is added to the LDCV and discharged from the vessel to control the heat generated by the pumps. Testing occurs on an irregular basis, but no more frequently than once per month. The discharge to the Process Sewer is monitored for radioactive contamination by an online monitor. Should radiation be detected, a diversion valve opens to discharge the process sewer water into the MASF radioactive waste system. The Process Sewer is protected from cross-contamination by a check valve downstream of the diversion valve and by piping elevation differences. The radioactive liquid waste system is a gravity drain system located about 1.22 meters below the process sewer. 481-A Pumphouse The 481-A Pumphouse has one routine contributor associated with water pump packing leakage from the sanitary water pumps. The other drains have moats around the drains to prevent accidental discharge.

---

**Code:** 400 RFD  
**Classification:** Not Accepted  
**Names:** 400 RFD; 400 Area Retired French Drains  
**Reclassification:** None  
**Type:** French Drain  
**Start Date:**  
**Status:** Inactive  
**End Date:**  
**Description:** The sites cannot be positively described, although most french drains in the 400 area are 1.5 meter (5 foot) long, 1.2 meter (4 foot) diameter concrete or vitrified clay pipes filled with gravel.
### Location:
The site(s) are purported to be located in various locations within the 400 area.

#### Description:
This site was one component of a sanitary sewer system that supported the temporary facilities during construction of the FFTF. The site was a sanitary sewer pond that has been backfilled and is not visible. It currently appears as a vegetation-free, cobble-covered area. Originally, the site was 152 meters (500 feet) long and (152 meters) (500 feet) wide. Three square unlabeled manholes that provided access to the sanitary sewer pipelines (now abandoned in place) are located in the area and each manhole is adjacent to two, 0.9 meter (3 foot) high metal posts.

#### Location:
The site is located west of the 4706 building.

### Related Sites/Structures:
The site was related to Portable Sanitary Sewage Treatment Plant (retired) (WIDS Site 400-9), sanitary sewer pipelines that remain in place, and retired septic tanks.

#### Description:
Three septic tanks are shown on drawing H-4-152051 and are listed as inactive waste disposal units in the Hanford Site Waste Management Units Report. There are no signs to mark the septic tanks. Surface features in the locations indicated on the drawing include two steel manhole covers near the southeast portion of 4702. One lid was partially covered with gravel. It is bolted down in the center and has perforated holes around its perimeter. The second manhole cover is posted with a "Danger: Limited Access, Confined Space, Class II" sign. On the east side of the center wing of 4702 Building is a 0.6 meter (2 foot) square concrete pad with a white 10 centimeter (4 inch) diameter PVC vent pipe protruding from the center. On the west side of the 4702 Building is a steel manhole that is surrounded by four yellow posts. It is also posted with a Confined Space, Class II sign. South of this manhole (on the west side of 4702 Building) is another 0.6 meter (2 foot) square concrete pad with a white 10 centimeter (4 inch) diameter PVC vent pipe protruding from the center.

#### Location:
The tanks are located on the south and west sides of the 4702 Building. The building is surrounded by vegetation-free, cobbles. Two tanks are on the south side of the building and one is on the west side near the northwest corner of 4702. The first tank is located approximately 40 feet (12.2 m) west of the southeast wing of the 4702 building. The second tank is located approximately 5 feet (1.5 m) east of the building's central wing. The third tank is located approximately 5.5 meters (18 feet) west of 4702 and east of the 4734-D building.

Hanford Site Waste Management Units Report
February 2015
**Type:** Trench  
**Start Date:** 1/1/1979

**Status:** Inactive  
**End Date:**

**Description:** A concrete-lined trench 61 meters (200 feet) long, 1 meter (3 feet) wide, and 0.3 meters (1 foot) deep, covered with steel grating. The site collects overflow water from the 483 Cooling Tower pad and directs it to the process sewer. There is no known contamination or postings at the site.

**Location:** The site is located north of the 483 Cooling Tower concrete pad running in an east to west direction. BHI-00012, Rev. 00, Figure 4-34, 300-FF-2 Operable Unit Technical Baseline report, shows the cooling tower overflow trench approximately 0.9 meters (3 feet) from the building.

**Related Sites/Structures:** The site is related to the 483 Cooling Towers and process sewer.

---

**Code:** 400 SS  
**Classification:** Accepted

**Names:** 400 SS; 4608 Sanitary Sewer; 4608 SS; 400 Area Sanitary Sewer  
**Reclassification:** Rejected (1/27/1999)

**Type:** Septic Tank  
**Start Date:** 1/1/1983

**Status:** Inactive  
**End Date:** 1/1/1998

**Description:** The unit is a septic tank with a 11,355 liter (3000 gallon) capacity. The surface features of the septic tank were two fiberglass manhole covers. One of the manhole covers was posted with a "Danger: Confined Space" sign. The area is covered by vegetation.

**Location:** The septic tank is located southwest of FMEF and the MO-353 office trailer, outside the security fence. The site is inside (east end) an area enclosed by a light weight post and chain. The chained area measures 30.5 by 36.6 meters (100 feet by 120 feet).

**Related Sites/Structures:** The septic system was associated with Trailers MO-353, MO-378, MO-379, and MO-908.

**Process Description:** The septic system was installed to service the mobile office trailers located south of FMEF, the Fuels and Materials Examination Facility (FMEF).

**Closure Info:** The reclassification to Rejected is documented on form 98-226. The tank was abandoned in place in June 1998. No samples were taken because the tank serviced only office trailers.

**Code:** 400 STF  
**Classification:** Accepted

**Names:** 400 STF; 4608 Sanitary Tile Field; 4608 STF; 400 Area Sanitary Tile Field  
**Reclassification:** Rejected (1/27/1999)

**Type:** Drain/Tile Field  
**Start Date:** 1/1/1983

**Status:** Inactive  
**End Date:** 1/1/1998

**Description:** The sanitary tile field is located within and at the west end of a vegetation-covered area that is bounded by steel posts and barricade chain. The 4608 Sanitary Sewer septic tank (400 SS) is on the east end of the chained area. The chained area is posted with a blue-and-white sign that reads "No Vehicles--Septic Field." The tile field has no surface features.

**Location:** The tile field is located in the southwest corner of the 400 Area, outside the security fence. It is inside an area bounded by light weight post and chain that measures 30.5 meters (100 feet) by 36.6 meters (120 feet).
Related Sites/Structures: The tile field is associated with the 400 SS septic tank (WIDS Site 400 SS) and the office trailers MO-353, MO-378, MO-379, and MO-908. The mobile office trailers are now unoccupied.

<td>The site is located north of the perimeter road that runs along the north side of the 400 Area, on the outside of the perimeter fence.</td>
</tr>
<tr>
<td>Process Description:</td>
<td>The 300-FF-2 Technical Baseline report states the vault may have been a septic tank or cistern used in the 1970's during the construction phase of the 400 Area. The Limited Field Investigation Report indicates the adjacent building foundation may have been a testing laboratory for testing concrete cores. The small structure that is also located in this vicinity is assumed to have been a sample preparation and concrete curing room. Remnants of concrete cores were observed around the building foundation and the cistern. At the time the samples were taken, a hose was inside the tank that may have been used to pump out the contents when the operation was abandoned. The floor of the tank contained sand and animal nesting material.</td>
</tr>
<tr>
<td>Closure Info:</td>
<td>During the 300-FF-2 Limited Field investigation (1995), the site was sampled and a radiological survey was done. No radiological contamination was identified. No metal concentrations were identified and the gross beta values were at background level. On September 16, 1998 the site was filled with sand slurry to complete the closeout of this site, in compliance with state regulations for abandonment of septic tanks. The reclassification is documented on form 98-092.</td>

<tr>
<td>Description: The site consists of a building foundation, sidewalks, and construction and demolition debris. The concrete building found is approximately 23 meters (75 feet) long and 7.6 meters (25 feet) wide. A portion of the building remains standing. That portion is made of painted concrete blocks with a corrugated metal room. The floor slopes to a centered drain. Lumber at the site indicates that the rest of the building may have been of wood construction.</td>
<td></td>
</tr>
<tr>
<td>Location: The site is located north of the perimeter road that runs along the north side of the 400 Area, outside the perimeter fence.</td>
<td></td>
</tr>
<tr>
<td>Related Sites/Structures: A cistern or septic tank is located within this area, adjacent to the building foundation. It is listed in the WIDS Database as sitecode 400-5.</td>
<td></td>
</tr>
<tr>
<td>Process Description: During the 300-FF-2 Limited Field Investigation (1995), a closer inspection of the area determined the building foundation was a testing laboratory for concrete cores. The small structure is assumed to have been a sample preparation and concrete curing room. There are numerous remnants of concrete cores around the area.</td>

| Code: 400-7 | Classification: Accepted |
| Names: 400-7; 4607 Sanitary Sewer; 4607 Sanitary Sewer Septic Tank; 4607 SS; 4607 SSST | Reclassification: Rejected (1/27/1999) |
| Type: Septic Tank | Start Date: 1/1/1978 |
| Status: Inactive | End Date: 1/1/1997 |
| Description: The septic tank was pumped out and filled with soil in February 2014. The unit is surrounded by a 2.4 meter (8 foot) high chain-link fence that is topped with three strands of barbed wire. The gate is unlocked and open. The top of a concrete structure had six metal access hatches. The hatches were marked with "Confined Space" signs. The septic tank inlet was a circular, above grade concrete tank. It was located approximately 3 meters (10 feet) from the south end of the concrete structure, just outside of the fence. |
| Hanford Drawing, H-4-38162, Civil Drawing Index Plot Plan, shows the various components of the system. They are the 4607 Septic Tank (WIDS Site 400-7), 4607 Leaching Field (WIDS Site 400-12), 4607 Sanitary Sewer Lagoon (WIDS Site 400-11). Note that this drawing shows the percolation ponds that belong to the process sewer system (WIDS Site 400 PPSS). |
| Location: The septic tank is located north of the 400 Area perimeter road, outside the fence. It is just west of the access road to the 4608-B and C Percolation Ponds. |
| Related Sites/Structures: The site is associated with underground lines, including the 4903 Sanitary Sewer Main, that runs throughout the 400 Area. The 4607 Sanitary Tile Field (WIDS Site 400-12) and the 4607 Sanitary Sewer Lagoon (WIDS Site 400-11) are also associated with this septic tank. |

| Code: 400-8 | Classification: Accepted |
| Names: 400-8; Construction Material Dumping Area (North of FFTF) | Reclassification: Rejected (12/3/1998) |
| Type: Dumping Area | Start Date: |
Inactive

Currently, the dumping area appears as a field that is partially covered with vegetation and strewn with debris. The debris consists primarily of construction and demolition waste. There are no boundaries to clearly define the size of the dumping area.

The site is located north of the perimeter road that runs along the 400 Area's north side. It is northwest of the 405 Reactor building.

The site was associated with the construction of the FFTF.

The site was a temporary sanitary sewage treatment plant. There is no visible evidence from the surface of the underground lines that remain in place, the removed treatment plant, or the backfilled pond.

The site is located just east of the 4701-C Guard Station site.

The site is related to the 453-B Switch Gear Pad. The site is a french drain. The visible portion is a 38 centimeter (15 inch) tall metal pipe, 10 centimeters (4 inches) in diameter. On two sides are 20.32 centimeter (8 inch) tall metal bars that are connected by a cross member. The drain is surrounded by four 1.2 meter (4 foot) tall yellow steel posts and is in the middle of a gravel covered field. The pipe is capped with a metal plug that has a raised square on top.

The drain is located approximately 52.4 meters (172 feet) south of the 408C West Dump Heat Exchanger (DHX), and (21.3 m) west of the 408B South Dump Heat Exchanger (DHX), and southeast of WIDS Site 400 FD5. This location is west of the 453B switch gear pad and south of the 402 Building.

The site is related to the 453-B Switch Gear Pad.
Names: 400-11; 4607 Sanitary Sewer Lagoon; 4607 SSL; 400 Area Wetlands

Reclassification: Rejected (1/27/1999)

Type: Pond

Start Date: 1/1/1986

Status: Inactive

End Date: 1/1/1996

Description: The site is a sanitary sewer lagoon that is currently dry. It has been backfilled and vegetated with grasses. The north and west sides are slightly depressed, but the south and east sides slope upward to the surrounding terrain. The adjacent terrain is covered with sagebrush and tumbleweeds. Signs are still present around the perimeter of the lagoon that state "Treated Sewage". Shortly after the 4607 Sanitary Sewer and the 4607 Sanitary Tile Field began operating in 1978, sanitary effluent began surfacing in the location of the drain field and overflowing into a natural depression nearby. In 1986, the drain field failed completely, causing effluent to overflow through a manhole and enter the depression through a drainage ditch. A valve pit diversion box was subsequently installed to divert the waste stream to the natural depression. It became known as the 4607 Sanitary Sewer Lagoon and the 400 Area Wetlands. The lagoon was deepened, a berm was constructed around it. The existing drainage ditch was backfilled.

Location: The lagoon is located northeast of the 4607 Sanitary Sewer septic tank (400-7) and southwest of the 4608-B and C Percolation Ponds (400 PPSS).

Related Sites/Structures: The lagoon was associated with the 4607 Sanitary Sewer (WIDS Site 400-7), 4607 Sanitary Tile Field (WIDS Site 400-12), and the 4903 Sanitary Sewer Main.

---

Names: 400-12; 4607 Sanitary Tile Field; 4607 STF; 4608A Leaching Field; 4608A Sanitary Sewer Leaching Field

Reclassification: Rejected (1/27/1999)

Type: Drain/Tile Field

Start Date: 1/1/1978

Status: Inactive

End Date: 1/1/1986

Description: There are no visible surface features to identify this tile field. The tile field consisted of perforated 10 centimeter (4 inch) diameter PVC pipe that discharged sanitary effluent by gravity. The pipe sloped 0.25 meters for every 30.5 meters (3 inches for every 100 feet) of length. The tile field was filled with 0.3 meters (3 feet) of gravel and was covered with "untreated building paper." Approximately 490 meters (1,600 feet) of PVC pipe connected the tile field with the 4607 Sanitary Sewer septic tank. Per Curt Clement, Dyncorp, the drain/tile field was abandoned in-place years ago when it originally failed. The tie-in has been plugged.

Location: The tile field was located north of the 400 area, outside the security fence and west of the fenced 400 Area Process Ponds.

Related Sites/Structures: The tile field is associated with the 4607 Sanitary Sewer (WIDS Site 400-7), 4607 Sanitary Sewer Lagoon (WIDS Site 400-11), and 4903 Sanitary Sewer Main.

Process Description: Effluent discharged from the septic tank through an underground PVC pipe to the 4607 Sanitary Tile Field. Numerous problems were encountered with the tile field. Septic tank effluent repeatedly surfaced in the area of the tile field and overflowed into a natural depression nearby (site code 400-11). In 1986, the drain field failed completely, causing effluent to overflow through a manhole and enter the depression through a drainage ditch. A valve pit diversion box was installed to permanently divert the waste stream to the depression.
### Code: 400-13  
**Classification:** Accepted  
**Names:** 400-13; Waste Dumping Site (East of FFTF)  
**Reclassification:** Rejected (12/15/1998)  
**Type:** Dumping Area  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The site is a dumping area. Debris has been dumped in several areas, scattered over an area occupying approximately 1.2 hectares (3 acres). One of the dumping areas was possibly fenced in the past, since two corners are framed by wooden posts with fallen fence rails and chicken-wire fencing.  
**Location:** The site is located northeast of the 400 Area, on the east side of a dirt access road. The unit is accessible by a dirt road that begins at the northeast end of the Fast Flux Test Facility (FFTF) Visitor Center parking lot.  
**Related Sites/Structures:** The site is believed to be related to the construction of FFTF.

### Code: 400-14  
**Classification:** Accepted  
**Names:** 400-14; Burn Pit (East of FFTF)  
**Reclassification:** Rejected (12/15/1998)  
**Type:** Burn Pit  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The 1994 site visit that supported the 300-FF-2 Technical Baseline Report stated the site was a large burn pit containing some visible, fire-scarred debris at the east end. Blown-in tumbleweeds were piled within the pit and some natural vegetation had begun to grow along the pit's walls. The unit's appearance indicated it has not been used for some time.  
**Location:** The site is located northeast of the 400 Area, outside the facility fence. The pit is east and southeast of a waste dumping area (WIDS Site Code 400-13), and is southeast of a suspected burial ground (WIDS Site Code 400-4). The unit is accessible by a dirt road that begins at the northeast end of the Fast Flux Test Facility Visitor Center parking lot.  

### Code: 400-15  
**Classification:** Not Accepted  
**Names:** 400-15; Diesel Fuel Tank Fitting Leak  
**Reclassification:** None  
**Type:** Unplanned Release  
**Start Date:** 1/1/1986  
**End Date:** 1/1/1994  
**Description:** The site was a petroleum unplanned release, discovered during the removal of two fuel tanks 400-FS-40 and 400-FS-4. One tank held diesel fuel and one tank held unleaded gasoline.  
**Location:** The release site is located in the southwest corner of the 400 Area Fire Station (4704-S) parking lot.  
**Related Sites/Structures:** The site was related to tanks 400-FS-40 and 400-FS-41 and the 400-39 bioremediation pad.  
**Process Description:** The tanks served as unleaded gasoline and diesel fuel storage tanks for the 400 Area fire station. The tanks, which were installed in 1986, were double-wall fiberglass construction. Each had a capacity of 1,892.5 liters (500 gallons). Prior to excavation of the two tanks, a site check was performed, which did not reveal any evidence of surficial contamination. The
The general condition of the fueling station was clean and appeared to be well maintained. Excavation for removal of the tanks was initiated on 5/9/1994. Removal of the concrete pad covering the tanks revealed hydrocarbon staining around both pump lines. No staining was evident above the tank structures. Inspection of the tanks after removal indicated that the integrity of both tanks was good. In addition, there was no indication from the tank wall surfaces or the soil directly around the tanks that leakage had occurred. Once the tanks were removed, soil samples were collected for laboratory analysis from the tank excavations, the spoils piles, and the soil around the pump piping. Excavation of the soil was initiated by the subcontractor who was removing the storage tanks. This excavation resulted in the removal of the contaminated soil at the site. The soil contamination found under the tanks and pump island were cleaned up and safely stored for later treatment. Soil samples were obtained and sent for independent laboratory analysis. The completion date for this activity was 5/25/1994. By August 1994, the 15.2 meter (50 foot) long and 9.1 meter (30 foot) wide tanks were removed. The excavation pit had been backfilled nearly to grade with clean soil and covered with gravel. All signs, barricades, and piles of soil had been removed.

---

**Code:** 400-16  
**Classification:** Accepted  
**Reclassification:** Rejected (12/3/1998)  
**Names:** 400-16; 4831 Flammable Storage Facility; 4831 FSF  
**Type:** Storage  
**Status:** Inactive  
**Description:** The unit is a yellow, corrugated metal building and a fenced concrete pad to the south. The pad is 6.1 meters (20 feet) wide and 15.2 meters (50 feet) long, surrounded by a 1.8 meter (6 foot) high chain-link fence with a locked gate. The building is about 6.1 meters (20 feet) high, 6.1 meters (20 feet) wide, and 15.2 meters (50 feet) long. A walk-in door and a roll-up door, located on the south side of the building, allow access from the building to the fenced area.  
**Location:** The building borders a portion of Texas Street's east end, and is south of the 4831 LHWSA.  
**Process Description:** The building is used to store flammable or combustible products, including lubricants and alcohols.

**Code:** 400-17  
**Classification:** Accepted  
**Reclassification:** Rejected (12/15/1998)  
**Names:** 400-17; Buried Construction Waste Area; Buried Construction Waste Area #1  
**Type:** Burial Ground  
**Status:** Inactive  
**Start Date:** 1/1/1977  
**End Date:** 1/1/1979  
**Description:** The site is a burial ground. The area shown on SK-4-81543 as a construction waste burial ground is partially covered by the 4843 Building and the 4843 Laydown Area. There is no visible evidence of a burial ground at this location. Areas surrounding the 4843 facilities appear as vegetation-free, gravel-covered fields.  
**Location:** The site is located northwest of the 451-B Substation and FMEF. It is partially underneath the 4843 Building and the 4843 Laydown Area.  
**Related Sites/Structures:** The site is associated with the construction of the Fast Flux Test Facility (FFTF).
Code: 400-18  Classification: Accepted
Names: 400-18; Buried Construction Waste Area; Buried Construction Waste Area #2  Reclassification: Rejected (12/15/1998)
Type: Burial Ground  Start Date: 1/1/1972
Status: Inactive  End Date: 1/1/1974
Description: The site is a burial ground. The area shown on SK-4-81543 as a construction waste burial ground is partially covered by the 4831 Flammable Storage Facility. There is no visible evidence of a burial ground at this location. The area is now a vegetation-free, gravel-covered field.
Location: The site is located northeast of the 451-B Substations and FMEF. It is partially underneath the 4831 Flammable Storage Facility and the 4831 Laydown Hazardous Waste Storage Area (4831 LHWSA).
Related Sites/Structures: The site is associated with the construction of the Fast Flux Test Facility (FFTF).

Code: 400-19  Classification: Accepted
Type: Storage Pad (<90 day)  Start Date: 1/1/1993
Status: Active  End Date:
Description: This facility consists of a tan-painted clearspan steel structure on a concrete pad. The structure's south, west, and north sides consist of steel siding, and its east side consists of 2.4 meter (8 feet) high metal chain-link fencing with two locked gates. It has a weather tight, zinc-coated steel roof with skylights and a full length roof vent. A 13 centimeter (5 inch) high and 15 centimeter (6 inch) wide concrete containment berm runs along the east side of the foundation. The facility's southeast corner is a fenced-off area, designated on drawings as a "Spill Cleanup Equipment Area," that is 3.0 meters (10 feet) long and 2.9 meters (9.67 feet) wide. Its concrete floor is raised about 15 centimeters (6 inches) from the building foundation. A section of this area is used to store clean empty drums for use as waste containers.
Location: The site is located south of the 4713-C Building and within the FFTF protected area fence.
Related Sites/Structures: This unit replaced the 4831 LHWSA in December 1993.

Code: 400-20  Classification: Not Accepted
Names: 400-20; Altitude Valve Pit T-58; Miscellaneous Stream #31  Reclassification: None
Type: French Drain  Start Date:
Status: Active  End Date:
Description: The site was listed as a french drain located under Altitude Valve Pit T-58. This site is the source location for WIDS Site 400 FD10. Stormwater runs into the drain at the bottom of the stairs and is routed to the french drain, 400 FD10.
**Location:** The Altitude Valve Pit T-58 is located beneath the 482-A Water Storage Tower.

**Related Sites/Structures:** The site is associated with 482-A, Water Storage Tank T-58, and WIDS Site 400 FD10.

**Names:** 400-23; 480-A Pump House French Drain; Miscellaneous Stream #34; Well Pump P-14 French Drain

**Type:** French Drain

**Status:** Active

**Description:** The site is a square opening in the concrete floor of the 480-A Pumphouse. The site receives leakage from the P-14 Pump. An open 10.2 centimeters (4 inch) diameter pipe was observed at the bottom of the site. The site was dry at the time of the inspection.
Location: The 480-A pumphouse is located northeast of the 4713-C building, and northwest of the 437 building. The site is located inside the pumphouse.

Related Sites/Structures: The site is associated with the 480-A Pumphouse, Well 499-SO-8, Pump P-14 and the Water Storage Tanks (T-330, T-87, and T-58). Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.

Process Description: The 400 Area receives raw water from groundwater wells. Normally, Well 499-S1-8J is the active well that supplies raw water to the water storage tanks (T-330, T-87, T-58). Pump P-16 is associated with Well 499-S1-8J and by changing the valve positions, water can be pumped to any of the three water storage tanks. Groundwater wells, 499-SO-8 and 499-SO-7, and their associated pumps, P-14 and P-15 respectively, serve as backup water supply to the 400 Area.

Process Description: The 400 Area receives raw water from groundwater wells. Normally, Well 499-S1-8J is the active well that supplies raw water to the water storage tanks (T-330, T-87, T-58). Pump P-16 is associated with Well 499-S1-8J and by changing the valve positions, water can be pumped to any of the three water storage tanks. Groundwater wells, 499-SO-8 and 499-SO-7, and their associated pumps, P-14 and P-15 respectively, serve as backup water supply to the 400 Area.

Location: The french drain is located northwest of the 4713-D building and east of the P-16 Pump House.
**Process Description:**

The 400 Area receives raw water from groundwater wells. Normally, Well 499-S1-8J is the active well that supplies raw water to the water storage tanks (T-330, T-87, T-58). Pump P-16 is associated with Well 499-S1-8J and by changing the valve positions, water can be pumped to any of the three water storage tanks. Groundwater wells, 499-S0-8 and 499-S0-7, and their associated pumps, P-14 and P-15 respectively, serve as backup water supply to the 400 Area.

**Related Sites/Structures:**

The site is associated with the 480-D Pumphouse, P-16 Pump, Well 499-S1-8J, and the Water Storage Tanks (T-330, T-87, T-58). Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.

**Related Sites/Structures:**

The site is associated with the 451-A Substation and 400 Area B/N Plant. Pump P-16 is associated with WIDS Site Code 400-25, Pump P-15 is associated with WIDS Site Code 400-24, and Pump P-14 is associated with WIDS Site Code 400-23.

**Type:** French Drain  
**Status:** Active

**Description:** This site consists of two drains located in the bottom of Electrical Manhole #1. These drains remove stormwater.

**Location:** Electrical Manhole #1 is located in the southeast corner of the 451 Substation.

**Related Sites/Structures:** The site is associated with the 451-A Substation and 400 Area B/N Plant.

---

**Code:** 400-28  
**Classification:** Not Accepted  
**Reclassification:** None

**Names:** 400-28; FFTF Dichlorodifluoromethane Releases

**Type:** Unplanned Release  
**Status:** Active

**Description:** The sites are "fugitive airborne emissions" from eight centrifugal chiller units at the Fast Flux Test Facility (FFTF). These units are used to provide cooling for personnel and equipment. Each chiller unit contains up to 3,000 pounds of dichlorodifluoromethane.

**Release Description:** The refrigerant dichlorodifluoromethane, or R-12, has reportedly been released in airborne emissions from the eight chiller units at the Fast Flux Test Facility (FFTF). Approximately, 1000 pounds of refrigerant are released each year (Dahl -1991). In Fiscal Year 1998, the R-12 refrigerant in all eight chillers was replaced with R-134A, which is nonhazardous and non-ozone depleting.

---

**Code:** 400-29  
**Classification:** Not Accepted  
**Reclassification:** None

**Names:** 400-29; FFTF PCB Containing Transformers

**Type:** Control Structure  
**Status:** Active

**Description:** The sites are the 19 electrical transformers within the Fast Flux Test Facility (FFTF) complex containing polychlorinated biphenyls (PCBs). All of the transformers are/were located within buildings or on the roof of buildings. Five of the transformers have been removed and disposed of in accordance with Toxic Substances Control Act (TSCA) regulations.
Location: All of the 19 transformers were located within the Fast Flux Test Facility (FFTF) Complex. 14 of the transformers remain in place at the FFTF Complex. 5 of the transformers have been removed.

Release Description: Past releases from the transformers "involved limited seepage from sample ports due to improperly installed fittings" (WHC-EP-0475-1). Additionally, some routine operations result in the release of small amounts of PCBs to the environment. The exact locations of the leakage are unknown, and it is unknown whether or not all 19 transformers were involved. WHC-EP-0475-1 states 0.0 pounds as the quantity of chemical released per year for these 19 transformers. All seepage and drips were cleaned up when discovered.

### Code: 400-31

**Classification:** Accepted  
**Reclassification:** Closed Out (9/17/2003)

#### Names: 400-31; 402 Building; Sodium Storage Facility

#### Type: Storage

#### Status: Inactive

#### Description:
The site was a RCRA permitted storage unit that was never used. The Sodium Storage Facility (SSF) and Sodium Reaction Facility had been a RCRA TSD. The TSD was administratively closed on 9/17/2003. The facility was designed to receive sodium drained from the Fast Flux Test Facility (FFTF) reactor coolant system. The unit consists of three 303,000 liter (80,000 gallon) tanks and one 197,000 liter (52,000 gallon) tank contained within a concrete structure approximately 27.7 meters (91 feet) long by 27.4 meters (90 feet) by 9.1 meters (30 feet) high. The total process design capacity for the four SSF storage tanks will be 1,105,000 liters (292,000 gallons). A secondary containment sump is capable of containing the contents of two of the 303,000 liter (80,000 gallon) tanks. The Sodium Reaction Facility (SRF) portion was not constructed.

#### Location:
The Sodium Storage Facility was constructed southwest of the FFTF Reactor (405 Building). The building is west of the 408B Building (Main Heat Dump, South) and south of the 408C Building (Main Heat Dump, West). The building was built over the 400 FD6 waste site.

#### Related Sites/Structures:
The Sodium Storage facility is related to the Fast Flux Test Facility (FFTF) and will be related to the Sodium Reaction Facility (SRF) was not constructed.

#### Process Description:
The SSF was designed to receive liquid sodium containing trace amounts of potassium through batch transfers from FFTF by way of transfer lines connecting the two facilities. The sodium will be stored in the SSF until transferred to the Sodium Reaction Facility (SRF) for treatment.

#### Closure Info:
The site was a RCRA permitted storage unit that was never used. A letter was sent by the DOE to Ecology on June 12, 2003 requesting to procedurally close the unit. A letter from Ecology to DOE on September 17, 2003 accepted DOE's request. The letters are sufficient to reclassify this site.

### Code: 400-32

**Classification:** Accepted  
**Reclassification:** Rejected (12/3/1998)

#### Names: 400-32; Construction Dry Well; U.G. Drywell - North

#### Type: French Drain

#### Status: Inactive

#### Description:
The site is a large gravel filled excavation that is labeled on drawing H-4-152051 as "U.G. Drywell". The drywell is a subsurface structure and is not visible at the surface.

#### Location:
The site is located west of the 483 Building.

#### Related Sites/Structures:
The site was associated with the construction of the Fast Flux Test Facility (FFTF).

#### Waste Type: Process Effluent

#### Waste Description:
The gravel filled excavation was used to dispose of water that collected in the bottom of the 400 Area foundation excavations during construction.

### Code: 400-33

**Classification:** Accepted

| Description:                               | A surface water drainage system made of a series of ditches and culverts is shown on drawing H-4-155518 and on H-4-150029. The ditch is shown to be northwest of the 437 building, measuring approximately 700 feet in length and exiting the northwest corner of the 400 Area. It was determined that this drainage ditch was never constructed. |
| Location: The ditch was supposed to be located outside of the northwest corner of the 400 Area perimeter fence. |

| Code: 400-35                               | Classification: Not Accepted          |
| Names: 400-35; Miscellaneous Stream #734; Southwest Surface Water Drainage Ditch | Reclassification: None |
| Type: Ditch                                | Start Date: 1/1/1982                  |
| Status: Active                             | End Date:                             |
| Description:                               | A surface water drainage system exits the southwest section of the 400 Area. This system collects surface water runoff from the area west of the Reactor Area. The system is a series of underground culverts and exposed, cobble ditches. It measures approximately 9829 feet in length. It exits the southwest corner of the reactor, area near the 4790 Patrol Headquarters building, as an underground pipeline. It turns south for approximately 229 meters (750 feet) along Grant Ave. It exists the security fence and runs along the FMEF parking area. It then turns to the west along Alabama Blvd. until it reaches the desert southwest of 400 Area. |
| Location: This drainage system is located partly inside and partly outside the southwest section of the 400 Area. |
| Waste Type: Soil                           |                                       |
### Waste Description:
The unit collects storm water runoff from the west section of the 400 Area Reactor Area.

**Names:** 400-39; 400 Area Bioremediation Pad; 400 Area Soil Cell

**Type:** Surface Impoundment

**Location:** The site is a bermed, mound of soil with a visible plastic liner. It is marked with a sign that says Keep Out - Petroleum Contaminated Soil.

**Process Description:** Remediation of the soil from the diesel tank leak (see sitecode 400-15) was accomplished using aeration/bioremediation in accordance with the June 21, 1994 letter provided by the State of Washington Department of Ecology (Ecology). The contaminated soil was placed in a plastic lined, bermed bioremediation pit, located 61 meters (200 feet) west of the tank excavation site. Fertilizer, water, and bacteria were added to the soil. More fertilizer and water were added daily, and the soil was tilled under for aeration. The bioremediation process was estimated to take 45 to 90 days.

**Waste Type:** Process Effluent

**Waste Description:** The bioremediation pad contains petroleum contaminated soil that was found when the fire station fuel tanks 400-FS-40 and 400-FS-41 were removed (see sitecode 400-15).

---

### Waste Description:
The 400 Area Waste Management Unit is considered an active RCRA TSD unit. It consists of two parts. The Fuel Storage Facility (FSF) is a one level reinforced concrete substructure covered by a steel frame, metal sided high bay building. The 400 Area Interim Storage Area (ISA) is a 156 by 75 meter (513 by 247 foot) fenced area with perimeter lighting.

**Location:** The two parts of the 400 Area Waste Management Unit are located in the northeast portion of the 400 Area. Both are north and east of the reactor building.

**Process Description:** The 403 Fuel Storage Facility (FSF) is capable of storing various types of mixed waste, but as of the effective date of the Part A Permit, only two steel boxes containing sodium contaminated Core Component Pots (CPP) are stored in the 403 FSF. The concrete pad in the fenced Interim Storage Area had been used for dry cask storage, but will not necessarily be used for storing additional mixed waste management.

**This Site has the Following SubSites:**

**Code:** 400-40:1

**Names:** 400-40:1; 403 Building Fuel Storage Facility
Names: 400-40:2; 400 Area Interim Storage Area (ISA)

Code: 400-40:1
Names: 400-40:1; 403 Building Fuel Storage Facility
Type: Storage
Status: Active
Classification: Accepted
Reclassification: None
Start Date: 
End Date:

Code: 403 FD
Names: 403 FD; 403 French Drain; Discharge Point from the 403 Building; Miscellaneous Stream #37; 400 Area Drain Discharge from 403; 400 Area French Drain Discharge from 403
Type: Injection/Reverse Well
Status: Active
Classification: Accepted
Reclassification: Rejected (12/15/1998)
Start Date: 1/1/1979
End Date:
Description: Previously, this discharge point was mistakenly described as a french drain. A 1996 site visit has confirmed that the discharge point is a pipe exiting the northeast side of the 403 Building. The effluent follows an asphalt trough to a drain in the pavement. The pavement drain is part of the 400 Area Stormwater Collection System (reference H-4-38972 and H-4-158520).
Location: The site is located on the east side of the 403 Building, just south of the northeast corner.
Related Sites/Structures: The site is related to the 403 Building and the 400 Area
Process Description: Heating, Ventilation, and Air Conditioning (HVAC) condensate and other liquids flow to a sump inside the 403 building. A sump pump pumps the liquid through the pipe that exits the
Waste Type: Sanitary Sewage

Waste Description: The unit may receive, or may have received air washer blowdown, Heating, Ventilation, and Air Conditioning (HVAC) system condensate, and stormwater from the 403 building, as well as janitorial solutions of water and detergents. The site has been removed from the active list of the "Inventory of Miscellaneous Streams", Revision 3, because the site does not discharge to an engineered disposal unit. The site is part of the 400 Area Stormwater Collection System.

Code: 427 HWSA

Classification: Accepted

Reclassification: Rejected (8/15/2013)

Start Date: 1/1/1985

End Date: 

Description: The site has been a 90 Day waste accumulation area. It was reclassified to Closed Out in 1999. In 2013, the reclassification was changed to Rejected, based on the definition that 90 Storage Pads are outside the scope of WIDS. The Reusable Oil and Empty Drum Storage Area was a concrete pad, approximately 9.1 meters (30 feet) long and 4.6 meters (15 feet) wide, surrounded by a 2.1 meter (7 foot) high chain link fence with a locked gate.

Location: The site was located north of the 427 Building and 4.6 meters (15 feet) inside the Fuels and Materials Examination Facility (FMEF) perimeter fence.

Process Description: The area became operational in 1985 to stage oil and lubricants.

Waste Type: Sanitary Sewage

Waste Description: The FMEF hazardous waste engineer indicates the Reusable Oil and Empty Drum Staging Area is used to stage containers of oils and lubricants, as well as empty drums. One report describes the 427 HWSA as a staging area for oils and lubricants. That description fits the Reusable Oil and Empty Drum Staging Area. However, another report states that the 427 HWSA was used as a staging area for ethylene glycol and ammonium hydroxide.

Closure Info: The Hazardous Waste Storage Pod was Closed Out on Reclassification Form 98-173.

Code: 437 MASF

Classification: Accepted

Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility

Reclassification: Closed Out (9/11/2003)

Start Date: 1/1/1982

End Date: 

Description: The RCRA TSD components associated with the 400 Area Maintenance and Storage Facility have been Closed Out. The 437 MASF never managed dangerous and/or mixed waste. A procedural/administrative closure was pursued for this unit.

MASF consists of a main building and a two-story service wing. It is a large concrete and rust-colored corrugated metal siding building (See photo #2). DOE/RL-88-21 shows the Dangerous Waste Permit Application was Closed on 9/11/2003. The MASF WIDS entry was divided into eight subsites.
The above grade portion of the main building is constructed of structural steel shapes. The first 3.05 meters (10 feet) elevation of the above grade exterior walls is made of 30.5 centimeters (12 inch) thick precast concrete panels containing 10.2 centimeters (4 inches) of sandwiched insulation. The remaining exterior walls above the 3.05 meter (10 foot) elevation are steel panels. Roof construction is a factory Mutual Class 1 rated insulated metal deck. The building substructure, including all the below grade cells, is concrete. The building is designed and constructed to seismic Zone 2 requirements and wind pressure of 25 pounds per square foot. The concrete lower exterior building wall panels were established by designed to maintain external radiation levels less than 0.2 mrem/h in accordance with DOE Standards for Radiation Protection (Chapter XI of DOE Order 5480.1).

The main building is divided equally into high and low bay sections with heights of 32 meters (105 feet) and 14.9 meters (49 feet). The entire area within the facility is serviced by a 60 ton overhead bridge crane with a 10 ton auxiliary hoist. The high bay section is serviced by a 200 ton overhead bridge crane with a 25 ton auxiliary hoist and includes repair/maintenance floor space and six below grade shielded cells for specialized storage, sodium cleaning, and maintenance services. The high bay also includes a Cask Decontamination and Maintenance Facility (CDMF) to clean and reconfigure the T-3 Shipping Casks. The low bay section includes storage, staging floor space, and the Decontamination Areas I and II shielded enclosure for low level decontamination of small tools, components, and miscellaneous equipment. The low bay also includes a Contaminated Equipment Repair Shop (CERS) for repair of decontaminated Interim Examination and Maintenance (IEM) Cell components. A 10 ton monorail hoist in the low bay supports the Decontamination Areas for handling components/equipment transported to and from the Decontamination Areas. A Shielded Cell Transfer Cask (SCTC), the SCTC air bearing carriage assembly, and the associated support structure are used for equipment transfers into and out of Decontamination Areas through the 1.01 meter (40 inch) diameter ceiling port. Crane controls for the 200 ton crane, the 60 ton crane and the 10 ton monorail are from individual manual pendants. Protective interlocks are incorporated into the crane control circuits to prevent interference of the 200 ton, 60 ton crane, or the 10 ton hoist.

The two story service wing is physically separated from the main building by a concrete/concrete block structural wall, fire wall, and shield wall. The process equipment room, process control room, personnel support areas, health physics office, and main lobby are located on the first floor of the service wing. Personnel support areas include the monitoring room, clothing issue, change rooms, and lavatories. Two 18,925 liters (5,000 gallon) stainless steel radioactive waste storage tanks are located in a concrete shielded cell beneath the process equipment room.

The second floor of the service wing includes the mechanical equipment room, office space, and lunch/conference room. The mechanical equipment room contains the heating, ventilating, and air conditioning (HVAC) equipment including the air handling unit, return air fan, return air HEPA filters, and the energy recovery unit. The loadout facility, attached to the west end of the service wing is a concrete shielded enclosure that is physically separated from the service wing by a concrete shield wall. The loadout facility is used for the transfer of radioactive liquid waste from the radioactive waste storage tanks to Hanford Site tank cars for transportation to the site disposal facilities.

Support Services include a railroad spur comes from the FFTF west track and extends through the main building, terminating at the north end of the building. A second railroad spur is provided from the loadout facility to the FFTF main track north of the MASF. Separate water supply lines are installed from the 400 Area water system to the building to provide both fire and sanitary water services. All post indicator valves in the fire water supply piping are supervised circuit valves. A 13.8 kV underground feeder and duct bank is installed from
Substation 451-B to the MASF outdoor substation transformer which provides a 480/277-V, 3-phase, 4-W, 60 Hz building electrical service. Low voltage drawout switchgear is used for distribution and control of building power. Each power circuit breaker has a solid state tripping device for either delayed, instantaneous, or ground fault tripping characteristics. Motor loads are fed from a motor control center. Lighting, receptacles, and other loads are fed from panelboards. The facility is surrounded by a grounding grid. All building steel and equipment are connected to the grid. The instrumentation system uses a separate analog system that ties directly into the FFTF analog ground grid. The MASF has a lightning protection system.

Sanitary water and fire protection water are supplied from separate mains to the building. A reduced pressure backflow preventer assembly is installed between the sanitary water and process water systems to protect the sanitary water supply. The sanitary sewer collects effluent waste from the sanitary fixtures and floor drains in the personnel support areas. The process sewer collects nonradioactive liquid from all areas of the facility. The primary source of nonradioactive water discharged to the process sewer is the sodium removal system.

All contaminated liquid waste in the facility is discharged into radioactive liquid waste tanks. The stored radioactive liquid waste is transferred to a railroad tank car in the loadout facility for disposal.

The Heating, Ventilation and Air Conditioning (HVAC) System supports all areas of the facility. The direction of air flow, pressure differentials and duct arrangement minimize the potential spread of contamination or the accumulation of inert gas, and potentially contaminated areas are maintained negative with respect to the outside atmosphere. The MASF HVAC System consists of a supply air system, a return air system, and an exhaust air system. All recirculated air or exhaust air from the facility passes through a bank of HEPA filters, and the filtered air is isokinetically sampled and continuously monitored for radioactive contamination.

Location:
The site is located in the northeast corner of the 400 Area, 152 meters (500 feet) north of the Fast Flux Test Facility (FFTF) complex, and west of the railroad track serving the FFTF Reactor Containment Building.

Process Description:
MASF is a multipurpose service center that supports the specialized maintenance and storage requirements of the 400 Area facilities. MASF provides the capability for sodium film removal, decontamination, repair, and storage of nonfuel components and hardware for the Fast Flux Test Facility (FFTF), Fuel Storage Facility and other major 400 Area facilities. Work in the MASF included handling items that are radioactive due to neutron activation and items that are contaminated with pyrophoric sodium metal (liquid). Transuranic materials, in the form of fuel, are not permitted in the building.

Waste Type: Sanitary Sewage

Waste Description:
This facility is currently being used for the decontamination of radioactive and/or sodium contaminated FFTF equipment, the repair of contaminated manipulators from the FFTF Reactor Containment Building, the staging of large pieces of equipment to be stored, repaired, or tested; and the temporary storage of low level radioactive solid and liquid wastes prior to shipment. Radioactive liquids are generated in the sodium cleaning vessel operation and Decontamination Areas. All radioactive liquids from the cleaning vessels and Decontamination Areas discharge into the radioactive waste tanks. The radioactive liquid in the tank(s) can be transferred to a liquid waste tank car in the shielded loadout facility for disposal. The capability to transfer radioactive liquids from the cleaning vessels directly to the tank car is also provided. All liquid can be discharged from the tank car through a filter to remove radioactive particles. To minimize the potential for spillage during loadout, overflow lines are provided from the tank car to the radioactive waste tanks. In the event of spillage, a collection basin in the floor also drains back to the waste tanks. The loadout facility is isolated during filling operations to minimize personnel exposure. Personnel exits are located at the north and south ends of the
The facility is maintained at a negative pressure with respect to the atmosphere to prohibit any inadvertent release of contaminants to the environs. Components or equipment containing a sodium film or small residual deposits of sodium can be transported to MASF for disposition. All sodium wetted components can be handled in inerted casks or containers and stored in inerted vessels in below grade cells. All sodium wetted components can be cleaned prior to repair/maintenance or other disposition.

**Waste Type:** Sanitary Sewage

**Waste Description:** The chemicals to be handled in MASF are of a typical industrial nature. These include organic acids for decontamination and caustic solutions and inorganic acids for regenerating demineralizer resins. The chemicals will be handled in fume hoods and areas appropriately vented and exhausted through a scrubber, demister, dryer and HEPA filters. Caustic rinse water from sodium cleaning operations will be present in the sodium cleaning vessels and piping systems.

**Code:** 437 MASF:1  
**Names:** 437 MASF:1; HVAC  
**Classification:** Accepted

**Reclassification:**  
**Start Date:**
**End Date:**

**Description:** This subsite has been Closed Out. The air handling unit (AH-1) provided ventilation and conditioned air throughout the facility. Makeup supply air was provided from the outside through a supply/exhaust air heat exchanger and dust filters to AH-1. Chilled water cooling coils in AH-1 cooled the makeup/recirculated air, as required by the HVAC temperature control system. Heated air is provided by electric heaters installed in individual area supply ducts. The supply fan air was controlled at a constant discharge pressure. In the event of a building static pressure upset, such as open doors or other disturbing conditions, the static pressure sensor modulated the supply fan variable inlet vanes to maintain a constant static pressure in the discharge plenum.
The return air system normally recirculated air from noncontaminated areas and introduces the air to the supply side of AH-1 after passing through a bank of HEPA filters. The return air was isokinetically sampled and continuously monitored prior to introduction into AH-1. Depending on temperature control demands or smoke/fire alarm conditions, the recirculated air could also be partially or fully exhausted from the facility. A flow-controlling instrumentation circuit modulates the variable inlet vanes in the return air blower as required to maintain the constant return air flow.

The exhaust air system takes exhaust air from the potentially contaminated areas for discharge to the atmosphere through HEPA filtration systems. Two exhaust air blowers (each 100% capacity) are provided in the exhaust system and operate in a lead/standby mode. The exhaust air is maintained at a constant volume flow rate by an air flow control circuit similar to the return air system. Automatic switchover from operating to idle blower is incorporated into the control system in the event of a blower system malfunction to ensure maintaining required negative pressurization in the facility. The exhaust air from Decontamination Areas I and II, CDMF, and process system contaminated vents are passed through a wet scrubber, demister, and dryer that are located upstream from the HEPA filters. Operation of the scrubber/dryer normally will involve evolutions that may produce sodium aerosols. All exhaust air passes through HEPA filters and is isokinetically sampled and continuously monitored for radioactive contamination prior to discharge from the building. Demisters were also provided on the exhaust air ducts in Decontamination Area I and Cask Decontamination and Maintenance Facility (CDMF).

A chilled water system feeds the cooling coils in AH-1 to remove heat from the supply air. The chilled water system consists of an air cooled water chiller with dual refrigerant circuits (each 50% capacity), dual chilled water circulating pumps (100% capacity) and piping, and controls to maintain air temperatures. The system configuration permits the use of one chilled water pump in the operating mode while the other chilled water pump remains on standby. Automatic switchover from the operating to the idle pump is provided in the event of pump or system malfunction. Suitable interlocks prevent the simultaneous operation of heating and cooling systems.

Self-contained HEPA filters, with prefilters, are installed as close as practical to the source of potential contaminants to minimize contamination of duct work. HEPA filters are tested at HEHF prior to installation, in place prior to system operation, and at least every two years thereafter. The HEPA filters are installed as single units or manifoded in filter banks and can be changed out as individual units without shutting down the HVAC System. Differential pressure gages are installed across HEPA filters to indicate filter loading. High differential pressure alarms are located on the HVAC control panel for all HEPA filters in the facility, except the CDMF filters.

The HVAC air flow control panel and temperature control panel are located in the mechanical equipment room. The HVAC air flow control system can be operated in a manual or automatic mode. The temperature control system operates in the automatic mode. Any off-normal condition will alarm at the HVAC control panel and the process control room panel.

All potentially contaminated areas are maintained at a negative pressure with respect to the environment and with respect to adjacent less contaminated areas to minimize the spread of potential contamination. Low range, high sensitivity differential pressure instrumentation provides indication and annunciation to the HVAC control panel, for those areas where contamination potential is greater. In addition, local alarm and indication are provided for those areas of greatest potential for contamination.

Smoke detectors are installed in the HVAC return and in selected exhaust ducts upstream from HEPA filters, and these initiate an alarm at the fire alarm control panel (FACP) if smoke is
detected in the HVAC exhaust or return ducts.

In the event of a smoke/fire alarm, the supply fan automatically shuts down. The return air recirculation damper to AH-I closes, and the return air is exhausted from the building. Both the return and exhaust fans will continue to operate to exhaust smoke from the facility.

An indicated radiation level above a preset limit in the return or exhaust duct isokinetic sampling and radiation monitoring system will initiate a visible and audible alarm in the process control room to alert personnel to the off normal condition. An assessment of the cause of the alert alarm condition will be made to determine the need and nature of the required corrective action. In the event that the indicated radiation levels in either the return or exhaust duct exceeds the preset high-alarm limit, the HVAC system supply, return and exhaust fans and dampers will automatically shut down (regardless of smoke/fire alarm conditions) to preclude any potential release of radioactive contamination to the environment or dispersal of contaminants to other areas of the facility. The isokinetic sampling monitor alarm setpoints are established in accordance with applicable requirements. The isokinetic radiation monitoring panel is located in the mechanical equipment room, adjacent to the HVAC control panels.

**Description:** This subsite has been Closed Out. The instrumentation control system (ICS) provided integrated control and instrumentation for the process system. The sodium removal, nitrogen, steam, contaminated waste, process water, process sewer, and demineralized water were subsystems of this system. Selected process system components located in administratively controlled areas were monitored and controlled in the process control room. The process control panel had visible and audible alarm annunciators. The process control operator took corrective action for alarm conditions. For key parameters, backup automatic action is initiated if the operator fails to respond to the alarm condition. Alarm windows are grouped by systems to aid the operator in quickly identifying the problem and facilitating corrective action.

The MASF Fire Protection System is designed in accordance with Fire Zone 3, Type II N requirements of the Uniform Building Code. The repair and storage area is classified as a Group B, Division 4 occupancy and the two-story service wing as a Group B, Division 2 occupancy. The wet pipe sprinkler system and fire detection/alarm system are designed and installed in accordance with National Fire Protection Association (NFPA) requirements, for ordinary hazard, Group 2 occupancy. All equipment and devices have the Factory Mutual Engineering Corporation approval or are listed for the use intended by the Underwriters Laboratory, Inc.

Fire Protection System alarm devices are zoned and arranged to provide a local fire alarm and fire zone identification at the fire alarm control panel (FACP). HVAC duct smoke detectors initiate an alarm at the FACP in the event of smoke detection. All FACP alarms are transmitted directly to the Hanford Site central fire station. The system also detects any trouble condition such as an inoperative alarm circuit, a closed post indicator valve or a normal power failure and transmits a trouble signal to the FACP and the central fire station.
Hose stations are installed in the repair and storage area in accordance with NFPA requirements.

Radiation Monitoring System

A radiation monitoring system provides radiation surveillance throughout the facility and alarms in the event of above normal radiation levels. The radiation monitoring system consists of remote area monitors, continuous air monitors, and fixed room air samplers. All liquid and gaseous effluents are monitored to prevent releases of radioactivity to the environment.

The local area gamma-radiation monitors visibly and audibly alarm locally and process radiation monitors alarm in the process control room in the event that radiation levels exceed pre-established radiation limits.

Hand and shoe counters are installed at all established exits from potentially contaminated areas to control the possible spread of contamination to other building areas.

Oxygen-Deficient Atmosphere

The principal inert gas present in the MASF is nitrogen, although an argon inerted component cask or container may be shipped to MASF providing the possibility that argon gas could also be present in the facility. Oxygen deficiency monitors are located in confined areas such as the mechanical service tunnel, Large Diameter Cleaning Vessel (LDCV) cell, test cell, Decontamination Areas I and II, and all stairwells where an oxygen deficient atmosphere might occur. The monitors provide an audible and visible alarm.

HVAC supply and exhaust ducting is arranged to ensure maximum circulation to prevent the accumulation of nitrogen or argon gas in confined areas.

Breathing Air System Alarms

Visible and audible alarms are provided at each breathing air station to indicate low air pressure and compressor trouble. The process control room has audible and visual alarms for low pressure, high compressor temperature and loss of alarm power.

Door Annunciators

Limit switches are located at all exterior personnel doors, with the exception of the main lobby door and the process equipment room personnel door. The limit switches indicate that a door is opened and that the contamination control boundary may have been compromised. The limit switches initiate a visible and audible alarm in the process control room.

Emergency Lighting

Battery powered emergency lights are strategically located throughout facility and in all stairwells and at exits to permit safe egress from the building in the event of a power failure.

The SubSite is Part Of:
Code: 437 MASF
Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility

Code: 437 MASF:3
Names: 437 MASF:3; Decontamination Areas
Classification: Accepted
Reclassification: Closed Out (9/11/2003)
This subsite has been Closed Out. The Decontamination Areas shielded enclosures inside the main building contains two separate shielded areas, Decontamination Area I and Decontamination Area II. Surface contaminated articles such as tools, small valves, and mechanical components were cleaned and packaged for storage, disposal, or repair. A 5 ton monorail is provided for material handling in the Decontamination Areas. Operation of the 5 ton monorail in both Decontamination Areas is by radio control.

Decontamination Area I was used for semi-remote or spray cleaning and hands-on spray cleaning of contaminated equipment using hot or cold water, steam, and suitable detergents. Two shield windows were installed in the Decontamination Area I shield walls. Work stations, which include all penetrations necessary for the semi-remote spray cleaning of equipment, are provided at each window location. Access to Area I is through a 1.01 meter (40 inch) diameter port in the ceiling via the Shielded Cell Transfer Cask (SCTC). A 1 ton jib crane and electric hoist are provided on the west wall of Decontamination Area I to relocate equipment to a position clear of the 1.01 meter (40 inch) ceiling port, allowing "turn key" operation. A door from Area II to Area I is allows equipment and personnel access.

Interim Examination and Maintenance (IEM) Cell equipment transferred items to and from Decontamination Area I using the SCTC, the SCTC Air Bearing Carriage Assembly, and the associated support structure located outside and over the Decontamination Area I cell. The SCTC consists of a shielded cask, an 8 ton hoist and cover assembly, a gas system for cask inerting and purging, and a closure valve. The SCTC is lifted by an overhead crane from the Maintenance Equipment Transport System to the Air Bearing Carriage Assembly and then moved via the carriage to a position over the Decontamination Area I 1.01 meter (40 inch) diameter ceiling port. The carriage is a platform with four air cushion pads and a control system for the air pads. To support the carriage and the SCTC, a support structure is provided that contains support beams between the overhead crane access area and the Decontamination Area I ceiling port. Area I shielding limits all adjacent areas to the design radiation level of 0.2 mrem/h for a maximum 10 R/h point source deposited on the surface of equipment. This point source approximates a 1 curie cobalt-60 equivalent activity deposit which is the maximum projected source to be handled in Decontamination Area I.

Decontamination Area II provided the necessary services for hands-on cleaning and maintenance operations of small, mildly contaminated parts. A 1.01 meter (40 inch) diameter ceiling port is provided in the ceiling to permit transfer of contaminated articles from the IEM Cell transfer container into Decontamination Area II. This area included a large ultrasonic cleaner, a sink with fume hood, worktable, safety shower, a solid waste compactor, service sink, and floor space for repair, packaging, and unpackaging components. The ultrasonic cleaning tank, worktable, and solid waste compactor were equipped with fume hoods. Hood exhausts discharged into the Area II HVAC exhaust duct. Large equipment double doors and a personnel airlock are also provided for access into Decontamination Area II. Decontamination Area II could process articles with measurable radiation levels up to 20 mrem/hr at 1 foot from the component. This point source approximates a 2 millicurie cobalt-60 equivalent activity deposit on the surface of equipment. As the above analysis showed that this activity was the maximum projected source to be handled in Decontamination Area II, Area II shielding has been designed to maintain the design radiation levels in adjacent areas below the design radiation level of 0.2 mrem/h while processing components/equipment with the above stated radiation levels.
The Below Grade Cells inside the high bay are concrete shielded enclosures, approximately 12.5 meters (41 feet) deep. They included two inert vessel cells, a large diameter cleaning vessel (LDCV) cell, a small diameter cleaning vessel (SDCV) cell, and an air and test cell. Equipment was accessed from above by removing the shielded floor plugs used to cover the cells. The 200 ton and 60 ton crane support these cells. The Below Grade Cell shielding maintained the radiation levels below 0.2 mrem/hr radiation to adjacent areas. An analysis was made of the potential FFTF components that might be handled in MASF. The worst case component allowed to be stored or serviced in each cell was an instrument tree in the inert vessel and LDCV cell, six reflectors in the SDCV cell, and an intermediate heat exchanger in the air and test cell. The instrument tree and reflectors experienced a maximum neutron flux from the FFTF core. The Intermediate Heat Exchanger (IHX) was subjected to the maximum corrosion product deposition from the primary coolant loops of the FFTF. Source strengths for these components were provided in the facility design criteria. The maximum allowable radiation levels from the cells to the adjacent areas are 2 mrem/hr in the mechanical service tunnel and below-grade cells and 0.2 mrem/hr in the stairwell and above-grade high-bay area.

The Inert Vessel Cells are constructed of a carbon steel vessel that provided controlled inert storage atmosphere for large sodium-wetted components prior to sodium film removal and for components that have been cleaned, repaired, and are ready for reuse. The Large Diameter Cleaning Vessel (LDCV) and Small Diameter Cleaning Vessel (SDCV) cells were the cleaning vessels for sodium film removal from sodium-wetted components. The LDCV and SDCV cleaning vessel design pressures are 20 psig. The vessels have been designed and fabricated to the ASME Boiler and Pressure Vessel Code. The LDCV has been hydrotested to 43 psig. The SDCV has been hydrotested to 30 psig.

The Air and Test Cell provided an area for maintenance and storage of large components, such as a primary pump, secondary pump, or an intermediate heat exchanger, after sodium removal.

The Radioactive Waste Tank Cell was a shielded concrete enclosure located beneath the process equipment room. The cell contains two 18,925 liters (5,000 gallons) stainless steel tanks for the storage of radioactive liquid waste. The tanks were tested in accordance with the ASME Boiler and pressure Vessel Code, Section VIII, Division 1. Design pressure of the tanks is 45 psig; hydrostatic test pressure is 67.5 psig. The cell shielding is based on the maximum source strength of the radioactive liquid stored in the tanks and has been designed to maintain the radiation levels in the process equipment room below the design radiation level of 0.2 mrem/hr. The source strength used in the design calculation is provided in the facility design criteria.

The SubSite is Part Of:
Code: 437 MASF
Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility
This subsite has been Closed Out. The Cask Decontamination and Maintenance Facility (CDMF) was an unshielded, air atmosphere glovebox located inside the high-bay area. The CDMF operated at a negative pressure with a once-through HEPA filtered air flow. The CDMF provided radiological containment for cleaning operations and inspections under T-3 Cask's license. Both supply and exhaust air was filtered.

Hands-on decontamination was done inside the glovebox enclosure using a water rinse system and special cask unloading, scraping, and inspection tools. The rinse water from the T-3 Cask was filtered in the CDMF adapter before it entered the Contaminated Liquid Waste System. The CDMF was serviced by a small 1/4 ton bridge crane and electric hoist that comply with all requirements for Hanford hoisting and rigging. CDMF was fabricated and helium-leak tested per HWS-12111, Amendment 1. The glovebox was equipped with an alarm for loss of negative pressure and a fire detector.

The SubSite is Part Of:
Code: 437 MASF
Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility

This subsite has been Closed Out. The Contaminated Equipment Repair Shop (CERS) provided the necessary services for hands-on repair and maintenance operations of Interim Examination and Maintenance (IEM) Cell components that had been decontaminated. The CERS is located in the low bay area and is operated at a negative pressure. The shop contained work tables and maintenance tools and is equipped with an overhead sprinkler system. The work tables had local HVAC exhaust drops. A 1 ton monorail and electric hoist services the CERS work tables and a 4 ton electric hoist was housed in a penthouse on the roof of the CERS.

The CERS was accessed through two large equipment doors and a personnel airlock. A ceiling equipment access hatch is also provided. A pair of seal tubes over the large double doors were used for manipulator retesting. Electrical penetrations are provided for contaminated IEM Cell TV equipment repair.

The SubSite is Part Of:
Code: 437 MASF
Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility

This subsite has been Closed Out. The Loadout Facility provided the necessary services for loadout and decontamination operations of Interim Examination and Maintenance (IEM) Cell components that had been decontaminated. The Loadout Facility is located in the low bay area and is operated at a negative pressure. The facility contained work tables and maintenance tools and is equipped with an overhead sprinkler system. The work tables had local HVAC exhaust drops. A 1 ton monorail and electric hoist services the Loadout Facility work tables and a 4 ton electric hoist was housed in a penthouse on the roof of the Loadout Facility.

The SubSite is Part Of:
Code: 437 MASF
Names: 437 MASF; 400 Area Maintenance and Storage Facility; 437 Maintenance and Storage Facility
This subsite has been Closed Out. The loadout facility is a concrete shielded enclosure that could accommodate the FFTF and Hanford Site tank rail cars for transfer and disposal of the radioactive liquid waste stored in the radioactive storage tanks. The shielding was designed to maintain the design radiation level of 0.1 mrem/h external to the facility and 0.2 mrem/h in the process equipment room. The shielding calculations used the maximum source strength in a 75,700 liters (20,000 gallon) tank car, as defined in the facility design criteria.

| Description: This subsite has been Closed Out. The sodium removal system consisted of the large diameter and small diameter cleaning vessels, fluid/gas supply systems, a vacuum pumping system, water recirculation system, gas recirculation system, and drain and vent systems. Because of the piping system design, only one cleaning vessel could be used at any one time.

The cleaning process consisted of recirculating a water vapor/nitrogen mixture (WVN) while venting gas to remove hydrogen. The reaction rate was controlled by monitoring the hydrogen concentration and adjusting the steam concentration as required to maintain the sodium reaction. The WVN process was continued until the moist circulating gas has completely reacted with the sodium film, as indicated by the hydrogen analyzer. The WVN process was then discontinued, and the vessel was slowly filled with hot demineralized water while the N2 flow continued and the hydrogen gas was monitored. After a suitable recirculation period, the water was drained, followed by additional rinses as required to ensure that all sodium hydroxide had been rinsed from the item, as indicated by the pH meter. A two-stage filter, with a removal efficiency of 98% (for 0.5 millimeter particles) was included in the water recirculation system to remove radioactive particulate contaminants from the circulating water. After completion of the rinse cycle, the article was dried by recirculating warm dry nitrogen through the system. The gas recirculation system included a gas cooler to remove moisture and a gas heater to reheat the gas to system temperature. The vessel could also be partially evacuated to facilitate the removal of moisture from the component.

Because of the small volume of the SDCV, the gas phase was a single pass through the vessel and through the scrubber/demister, dryer, and HEPA filters to the HVAC exhaust.

A two stage filter in the water recirculation system is installed in a separate shielded enclosure in the LDCV cell. The expected maximum radiator level of the filter is 80 rem/h within the shielded enclosure. The entire filter assembly, including filter housing, is designed for remote disconnection and removal from the system. Filter piping connections are remotely operated, band type connections and valves are provided with reach rods to permit all required filter removal operations external to the shield enclosure. The filter removal from the enclosure will be accomplished using the FFTF solid waste cask (equipped with electrically operated internal grapple). After filter removal, filter replacement is manually accomplished in the shielded enclosure.
Gas Analyzer System

A gas analyzer system is provided to monitor oxygen, hydrogen, and moisture during the sodium cleaning process.

The gas analyzer monitors the oxygen concentration in the cleaning vessel to ensure an inert atmosphere for sodium-wetted components and detects any air in-leakage to the vessels. The oxygen analyzer is capable of detecting oxygen concentrations of <0.25% to 5% by volume. At a preset high oxygen concentration limit, the flow of steam is automatically cut off, and additional nitrogen is introduced until the oxygen concentration is within specification.

The gas analyzer monitors the hydrogen concentration to control the sodium removal process and to protect against potentially explosive concentrations in the cleaning vessels. The gas analyzer is capable of detecting hydrogen concentrations in the range of <0.25% to 5% by volume. At a preset high hydrogen concentration limit, steam flow automatically stops and full nitrogen flow is initiated.

The gas analyzer monitors the moisture concentration of both the nitrogen/steam injection and the process system nitrogen gas to control reaction rates and to indicate the end point of the drying process. The instrument is capable of detecting and indicating moisture concentrations in the range of 0.5% to 25% by volume. The instrument indication is used to control the nitrogen/steam ratio and to monitor the drying process.

Process Sewer

Nonradioactive process water from the cleaning vessel is pumped directly to the process sewer. The water is monitored for pH and radioactivity in the sodium cleaning system prior to discharge to the process sewer. Additionally, a liquid monitor in the process sewer system continually checks the discharged water for radioactivity. A removable spoolpiece is provided as a cross connect to the contaminated liquid waste system. The spoolpiece is only installed when the discharge water meets the requirements of the concentration guides in DOE Order 5480.1, Chapter XI. In the event that the discharge water does not meet minimum standards for draining to the process sewer, the water will be automatically diverted to the radioactive waste tanks.

Contaminated Liquid Waste System/Contaminated Gas Vent System

All contaminated liquid waste will be discharged directly to the radioactive waste tanks. During discharge of contaminated liquid waste to the radioactive waste tanks, the removable spoolpiece (cross-connect between the process sewer and the contaminated liquid waste system) is removed to prevent potential release of contaminated liquid waste to the process sewer. Pipe connections are blanked off with blind flanges when the spool piece is not installed.

The contaminated liquid waste in the radioactive waste storage tanks is pumped directly to a railroad tank car in the loadout facility for transport to an appropriate disposal area. All major contamination sources are filtered prior to entering the Contaminated Liquid Waste System. The ultrasonic cleaner in Decontamination Area II has a 20 micrometer in line cartridge filter. The floor drains in Decontamination Areas I and II have 50 micrometer cloth bag filters in metal strainer baskets. The adapter drain basket on the Cask Decontamination and Maintenance Facility has a polyester filter pad insert. These filters minimize the contamination buildup in the Contaminated Liquid Waste System drain lines and storage tanks. In addition, the storage tanks can be flushed and recirculated during the loadout operation to minimize radiation buildup in the tank cell.
All contaminated gas is vented through a scrubber/demister/dryer and HEPA filter system prior to release to the atmosphere.

The SubSite is Part Of:

Code: 4713-B FD
Names: 4713-B FD; 4713-B French Drain; Miscellaneous Stream #33
Type: French Drain
Status: Active

Description: The unit is a pipe that is 1.5 meters (5 feet) long and 61 centimeters (24 inches) in diameter. The pipe is constructed of concrete and is filled with gravel. The pipe is buried vertically, extends above grade 15.2 centimeters (6 inches) and is covered by a metal grating. Three parallel metal pipes emerge horizontally from the east side of the 4713 Building, then bend 90 degrees downward and end approximately 0.3 meters (1 foot) above the metal grating.

Location: The site is located about 1.22 meters (4 feet) east of 4713B.

Process Description: The site is associated with waste water discharges (miscellaneous stream #33) from the 4713B Maintenance Building. In 1996, the sink was disabled to prevent discharge of gray water (waste water excluding sewage) to the french drain. Remaining inputs are infrequent discharges from the 4713B fire sprinkler system and eyewash station.

Related Sites/Structures: The site is related to the 4713B Protected Area Maintenance Building.

Waste Type: Sanitary Sewage

Waste Description: In 1987, the site received approximately 3,785 liters (1,000 gallons) of waste water from lunchroom sinks. In 1988, the french drain received only intermittent discharges and had a normal flow rate of zero. The "Inventory of Miscellaneous Streams", Revision 3, states that the employee sink water and drinking fountain supply have been shut off. The eyewash station is still an active source. Routine maintenance discharges will be covered under ST 4508 (when it is approved by Ecology). The current flow rate (1998) is less than 0.038 liters (0.01 gallons) per minute.
### Related Sites/Structures:
The site is associated with the 4713B Maintenance Building.

### Waste Type:
Sanitary Sewage

### Waste Description:
The site was used as an accumulation area to store waste in cabinets and drums. The wastes were small quantity items related to FFTF maintenance activities. Wastes included fluorescent bulbs, incandescent bulbs, mercury vapor lamps, hazardous rags, solvents, suspected PCB-containing ballasts and capacitors, non PCB containing ballasts and capacitors, persistent carcinogens, and printed circuit boards, and miscellaneous equipment.

### Code: 4713-B LDFD
### Classification: Accepted
### Names: 4713-B LDFD; 4713-B Loading Dock French Drain; Miscellaneous Stream #469
### Reclassification: Rejected (12/3/1998)
### Type: French Drain
### Status: Active
### Description: The site is a circular metal grate located in an asphalt paved area east of the 4713-B loading dock. The site sits in a small depression. The site appears to be a stormwater access point to the 400 Area surface drainage system. It does not appear to be a ground disposal site.
### Location: The site is located about 23 meters (75 feet) east of the 4713-B building.

### Waste Type: Misc. Trash and Debris
### Waste Description: The current "Inventory of Miscellaneous Streams", Revision 3 states that the site collects stormwater and discharges it to the 400 Area stormwater collection system. The current flow rate is less than 1.9 liters per minute (0.50 gallons per minute). Earlier documents, Low Volume Effluent Streams report (Milikan 1988) and the Inventory of Miscellaneous Streams Report (WHC 1993 and DOE/RL-95-82), have stated it receives cooling water from welding equipment or sink water. This earlier data may actually refer to WIDS Site 4713-B FD.

### Code: 4721 FD
### Classification: Accepted
### Names: 4721 FD; 4721 French Drain; Miscellaneous Stream #28; 400 Area French Drain Discharge from 4721 Building
### Reclassification: Rejected (12/3/1998)
### Type: French Drain
### Status: Active
### Start Date: 1/1/1979
### Description: The unit is a 1.2 meter (4 foot) diameter, 1.5 meter (5 foot) long concrete or vitrified clay pipe filled with gravel. The unit is below grade and cannot be identified visually at the location identified in the "Inventory of Miscellaneous Streams".
### Location: The site is located west of the 4721 building in a gravel covered area.

### Related Sites/Structures:
The french drain is connected to the 4721 Building. This facility is also called the FFTF Emergency Generator Facility or Gas Turbine Building.

### Waste Type: Soil
### Waste Description: If a spill occurred during generator operations, the unit might have received diesel oil. Because oil had to be pumped up to the generator from the underground storage tank, spills should not have occurred when the system was not operating. There are no known spills.
<table>
<thead>
<tr>
<th>Waste Type: Soil</th>
<th>Waste Description: The unit may have received janitorial solutions of water and detergents. The &quot;Inventory of Miscellaneous Streams&quot;, Revision 3, states that the site routes stormwater from floor drains to an injection well on the west side of the building. The flow rate is less than 0.038 liters per minute (0.01 gallons per minute).</th>

</tbody>
</table>
Status: Inactive  End Date: 1/1/1985

Description: The Hanford Site Waste Management Units Report (1987) lists the site as a French drain that is 1.22 meters (4 foot) in diameter, concrete or vitrified clay, gravel-filled buried pipe that extends 1.5 meters (5 feet) below grade. Surface features include a 5 centimeter (2 inch) diameter pipe protruding from the south side of the 4722-C Building. The pipe emerges from the wall approximately 0.6 meters (2 feet) above the building foundation and travels west approximately 0.9 meters (3 feet). The pipe turns 90-degrees downward and then turns 90-degrees to the south. The visible piping terminates in the gravel beside the building. No drain structure is visible. Per the DynCorp Environmental Compliance group, the pipe is connected to a sink. The drainage is planned to be eliminated.

Location: The drain is located approximately 1.2 meters (4 feet) from the south wall of the 4722-C building.

Related Sites/Structures: The site is associated with the 4722-C Paint Shop.

Process Description: The site receives waste water from a sink inside the 4722-C Facility. A statement provided by DynCorp on January 21, 1999 says that it is noteworthy that currently there are two sinks in this facility. The sink, located within the area where the painting is done, is connected to the sewer not the drywell.

Waste Type: Process Effluent

Waste Description: The source of the discharge to the French drain was eliminated by close of business on 1/28/99. The water was disconnected. The information provided in the following paragraph has been provided for historical purposes. The Hanford Site Waste Management Units Report (1987) states the drain received water 7570 liters (2,000 gallons per year) from a sink used to wash latex paint from hands, brushes and rollers. It also states a sample was taken from the unit and found no hazardous constituents. A 1988 report (DOE/RL-88-11, Revision 0) states that the hazardous chemical inventory for this site includes 1,000 kilograms (2,200 pounds) of sodium dichromate (Reference 1). This data is unsubstantiated. In 1995, the Inventory of Miscellaneous Streams Report DOE/RL-95-82, Rev 0, Table 3-1, changed the process description to indicate the waste is condensate that originates from a water heater on the west side of 4722-C. The flow rate is listed as 0.038 liters (0.01 gallons) per minute. A statement provided by DynCorp on January 21, 1999 says that it is noteworthy that currently there are two sinks in this facility. The sink, located within the area where the painting is done, is connected to the sewer not the drywell. DynCorp has not been able to find anyone with any knowledge of what went into the drain. The 'Registration of Hanford Site Class V Underground Injection Wells', DOE/RL-88-11 contains no references that could be used to verify the statement related to the amount of sodium dichromate. It is possible this statement is in error. There is at least one other error, as the formula for sodium dichromate (Na2Cr2O7) is not NaCr2.

Code: 4831 LHWSA
Classification: Accepted

Names: 4831 LHWSA; 4831 Flammable Storage Facility; 4831 Laydown Hazardous Waste Storage Area; 4831 Laydown HWSA

Reclassification: Rejected (8/15/2013)

Type: Storage Pad (<90 day)
Start Date: 1/1/1984
End Date: 1/1/1993

Status: Inactive

Description: The site has been a 90 Day waste accumulation area. It was reclassified to Closed Out in 1999. In 2013, the reclassification was changed to Rejected, based on the definition that 90 Storage Pads are outside the scope of WIDS. It was an empty concrete pad with a metal berm around its edges. The metal berm measures 5 centimeters (2 inches) tall and 5 centimeters (2 inches) wide.
around the concrete pad. Cylindrical concrete anchors are attached to 1.2 meter (4 feet) high metal posts that have been placed around the edges of the pad. Most of the posts remain upright and are connected with a metal chain. A small, tan metal shed at the east end of the pad provided supply storage and a sheltered workspace when the storage area was operating. The shed is 4.9 meters (16 feet) long and 3 meters (10 feet) wide and has double sliding doors on its south side.

Location: The site is located at the east end of Texas Street, north of the 427 Building. The concrete pad is approximately 10 meters (30 feet) north of the 4831 Flammable Storage Facility.

Waste Type: Process Effluent

Waste Description: The site was used as a staging area for oils and hazardous wastes produced and collected in the 400 Area. Wastes staged at this site in 1987 were primarily oils, solvents, ethylene glycol, and empty drums for cooling water treatment chemicals such as Endcor 4690, which is acutely hazardous. These wastes were stored in containers on the pad.

Closure Info: The Laydown Hazardous Waste Storage Area was Closed Out on Reclassification form 98-100.

This pad was retired in December 1993 and replaced with the new 440 Hazardous Waste Temporary Storage Facility. On September 8, 1998, the FFTF Environmental Compliance Officer reviewed available inspection records for the 4831 90 Day Accumulation Area. The records covered the period from 1991 to 1993. In 1993, the 440 Building 90 Day Accumulation Area was put into operation, and the 4831 Building 90 Day Accumulation Area was no longer used. The inspection records did not identify any history of waste container leakage at the 4831 90 Day Accumulation Area. The FFTF Environmental Compliance Officer performed a walkdown and visual inspection of the 4831 90 Day Accumulation Area. There was no evidence of past leakage at the facility. There was some slight rust staining in areas, but no evidence of hazardous material leakage.

Code: 4843

Names: 4843; 4843 Alkali Metal Storage Facility; 4843 AMSF; 4843 Building; 4843 FFTF Sodium Storage; 4843 Laydown Area Warehouse

Type: Storage

Status: Inactive

Description: The 4843 Alkali Metal Storage Facility was a RCRA TSD unit that has been Closed Out. It was built to store dangerous and mixed alkali metal waste. The site began storing materials on April 10, 1986. All materials were removed from the building (date not known). The structure was radiologically released by the Department of Health on May 9, 1995. A letter from the Department of Ecology to the Department of Energy dated May 28, 1997 formally documents the clean closure of the site in accordance with Washington Administrative Code (WAC) 173-303 as of April 14, 1997.

A site visit in October 1998 found the site to be unchanged from previous descriptions.

Location: The 4843 Building is located in the northwest corner of the 400 Area. A large laydown area is located adjacent to and west of the structure.

Related Sites/Structures: After the RCRA permit was closed, a new WIDS code was created (400-36), at the request of EPA, for its new use as a waste transfer station.

Waste Type: Process Effluent
The unit was a storage area for dangerous and mixed alkali metal wastes generated by FFTF and various other operations at the Hanford site. Dangerous and mixed alkali metal wastes that have been stored at the facility include mixed sodium waste; materials used to clean up radioactive sodium; non-radioactive sodium waste; waste radioactive sodium metal; and non-waste, non-radioactive sodium metal. Waste containers used at this facility may have included steel 19 liter (5 gallon), 114 liter (30 gallon), and 208 liter (55 gallon) drums or sealed piping and components that have been welded closed.

The site began storing materials on April 10, 1986. All materials were removed from the building (date not known). The structure was radiologically released by the Department of Health on May 9, 1995. A letter from the Department of Ecology to the Department of Energy dated May 28, 1997 formally documents the clean closure of the site in accordance with Washington Administrative Code (WAC) 173-303 as of April 14, 1997 (Administrative Record #0047356).

The letter from the Department of Ecology to the Department of Energy dated May 28, 1997 formally documents the Clean Closure of the RCRA permit.

WAC 173-303-630(10) requires that at closure, all dangerous waste and dangerous waste residues be removed from the containment system. However, there are no documentation requirements for this closure, and thus no referenceable records for older pads. For many of these older pads, the exact locations were not recorded and cannot be reliably re-examined at this time. By analysis of the spill response standard operating procedure and interviews with the spill response coordinator, documentation of closure of these 90 Day Storage Areas can be recreated. According to J. Culmer (July 31, 2000), spill response and reporting coordinator, there have been no releases to the environment from 90-Day pads. The HNF-PRO-453 Spill and Release Reporting procedure covers cleaning up releases and entering release sites, where releases cannot be immediately cleaned up due to the location of the release or the decision made to clean up the site at a later date, as part of the Operable Unit. If the release is to be
cleaned up as part of the Operable Unit, then it is required that the release site and material released be added to an existing Operable Unit WIDS site or a new WIDS site created and entered into the data base. Mr. Culmer is not aware of any spills or releases onto 90 Day Storage Pads, that have not been cleaned up immediately, waste managed properly and then disposed of per state and federal requirements. All releases have been handled per the HNF-PRO-453 Spill and Release Reporting procedure. The releases onto 90 Day Storage Pads that had been reported internally to the spill response office were small leaks from containers that had been cleaned up; none of these releases migrated off the pads and into the soil column.

Code: 600 ESHWSA  
Names: 600 ESHWSA; Hazardous Waste Storage Area (Exploratory Shaft); 600 Area Exploratory Shaft Hazardous Waste Storage Area; 600 Area Exploratory Shaft HWSA  
Type: Storage Pad (<90 day)  
Status: Inactive  
Start Date: 1/1/1983  
End Date: 1/1/1988  
Description: The Hazardous Waste Storage Area has been reclassified to Rejected. The Exploratory Shaft Facility has been decommissioned and reclaimed. All of the waste was removed. No visual evidence of the site remains, but the specific location is not known.

Location: This site is located at the Exploratory Shaft Facility, west of 200 West Area and southeast of the Yakima Barricade, near Army Loop Road.

Related Sites/Structures: The associated facility is the Exploratory Shaft Site.

Process Description: This site was a storage area for hazardous waste at the Exploratory Shaft Facility.

Waste Type: Process Effluent

Waste Description: Materials located at the site were excess paint, anti-corrosive coatings, fuels, lubricants, and other similar potentially hazardous materials.

Closure Info: On March 23, 1988 all decommissioning and reclamation work was completed at the Exploratory Shaft Facility. All hazardous waste and materials were removed from the site.

The site was Reclassified to Rejected on form 2000-028.

Code: 600 ESST  
Names: 600 ESST; Septic Tank - Exploratory Shaft; 600 Area Exploratory Shaft Septic Tank  
Type: Septic Tank  
Status: Inactive  
Start Date: 1/1/1981  
End Date: 1/1/1988  
Description: This was the site of the Exploratory Shaft Facility septic tank. This area has been reclaimed due to project cancellation. The septic tank was properly abandoned per WAC codes. No visual evidence of a septic tank remains.

Location: This site is at the Exploratory Shaft Facility, west of 200 West Area and southeast of the Yakima Barricade, near Army Loop Road.
This site provided sanitary wastewater disposal for the Exploratory Shaft Facility.

Related Sites/Structures: This site has an associated drainfield and distribution box.

Process Description:

Waste Type: Process Effluent

Description:

Closure Info: The site has been abandoned per WAC code. Decommissioning and reclamation work was completed at the Exploratory Shaft Facility on March 23, 1988. The septic tank was pumped out, the access manhole covers were removed, and it was backfilled with clean sand. The sanitary concrete distribution box was removed and voids were filled. The steel posts and barrier rope around the drain field were removed, and the drain field pit was backfilled.

Reclassification:

Names: 600 NSTFST; Near Surface Test Facility; Septic Tank; 600 Area Near Surface Test Facility Septic Tank

Type: Septic Tank

Status: Inactive

Description: The septic tank and associated tile field that has been pumped and properly abandoned in 1998. The septic tank serviced the Trailer Village that was located at the base of Gable Mountain.

Location: This site is located at the west end of Gable Mountain, at the base of the north side.

Related Sites/Structures: The tank was associated with the Near Surface Test Facility Trailer Village.

Process Description:

Waste Type: Process Effluent

Description: The unit received sanitary wastewater.

Closure Info: The septic tank was pumped out and backfilled. Decommissioning and reclamation activities at the Near Surface Test Facility were completed March 23, 1988.

The site was reclassified to Closed Out on form 2001-028.

Reclassification:

Names: 600 NSTFUT; Near Surface Test Facility; Underground Tank; 600 Area Near Surface Test Facility Underground Tank

Type: Storage Tank

Status: Inactive

Description: The waste site has been reclassified to Closed Out. It consisted of two sanitary waste holding tanks. The two sanitary waste holding tanks were removed from the site. The tanks supported
the mobile office trailers that were located on the tunnel bench for the Near Surface Test Facility. The tanks each had a 3,785-liter (1,000-gallon) capacity and were emptied every other week. All decommissioning and reclamation work at the Near Surface Test Facility was completed on March 23, 1988.

**Location:** The tanks were located on the tunnel bench for the Near Surface Test Facility, on the north side of Gable Mountain.

**Process Description:** The tanks received sanitary waste from mobile office trailers.

**Waste Type:** Process Effluent

**Waste Description:** The tanks received sanitary wastewater.

**Closure Info:** The holding tanks were removed from the site.

The site was Reclassified to Closed out on form 2001-029.

---

**Code:** 600-1  
**Classification:** Accepted

**Names:** 600-1; Westinghouse Debris Pit  
**Reclassification:** Rejected (4/6/1999)

**Type:** Dumping Area  
**Start Date:** 1/1/1976

**Status:** Inactive  
**End Date:**

**Description:** The site is a large depression with sandy soil and sagebrush. Part of the depressions has been backfilled with soil from adjacent areas. Metal and wood scrap can be seen on the surface. Soil subsidences (sink holes) are evident. One faded yellow sign that states "Positively No Dumping" is located on the south side of the site, adjacent to the gravel road. The sign is located in between the 600-1 trench (located on the east side of the depression) and the JA Jones Pit 1 (located on the west side of the depression). Bulldozer scars are evident on the surface.

**Location:** This site is located on the east side of a large depression that is located north of the 300 Area, east of the point where the railroad tracks cross Route 4 South.

**Related Sites/Structures:** The trench is adjacent to and east of the J. A. Jones 1 Dumping Pit.

**Process Description:** Interviews with two employees indicate that two trenches were co-located in this depression. One trench was dug from east to west. It was located on the west side of the depression and was used by the J.A. Jones Company to dispose of inert waste, paint products and debris (see WIDS Site JA Jones #1). The other trench was dug from north to south, located adjacent to the J.A. Jones pit. It was used by the 300 Area Westinghouse facilities as a disposal site for tumbleweeds that collected on the 300 Area fences. The site may have received miscellaneous wood, pallets and debris from the 300 Area Westinghouse facilities during the late 1970's and early 1980's. A 1994 site visit observed evidence that tumbleweeds had recently been dumped along the southeast edge of the site, indicating the area was still being used for this purpose.

**Waste Type:** Process Effluent

**Waste Description:** The site was used by the 300 Area Westinghouse facilities. It was used mostly to dispose of the tumbleweeds that accumulated on the 300 Area fences. Some wood, pallets and miscellaneous debris may have also been placed in this trench.

**Waste Type:** Process Effluent
October 1994 interviews with Will Kirk and Tony Day, retired Hanford employees, disclosed that aluminum silicon alloy, may have been disposed of at 600-1. Interviewees were unable to positively confirm dumping at this site, but felt a reasonable certainty. Aluminum silicon alloy was used in its molten state as a reactor fuel cladding process dip in the 313 Building and waste aluminum silicon alloy usually had low levels of uranium contamination.

Waste Type: Process Effluent
Waste Description: Roofing remnants, plastic bucket with dried paint, rebar, aluminum, bits of concrete, asphalt, wood, and plastic are visible at the site.

Waste Type: Process Effluent
Waste Description: Reports indicate some materials may have been of military origin. No hazardous materials were indicated in reports or on walkdowns. Some metal debris and a few chunks of concrete were visible in 1998 and 2000. Some wire was found in an adjoining gully.

Waste Type: Process Effluent
Waste Description: The site is a dumping area left from its use as a military encampment. It includes a garbage dump, the remains of old military tent city, gun emplacements, two small water towers, and scattered debris. A portion of a large gravel pit, located approximately 525 meters (1722 feet) south of Route 1 and west of the railroad tracks that are located closest to the entrance to 100-K, was used as the garbage dump. A wooden loading ramp was used to dump the garbage. To the northwest is the remains of the old military tent city. Earth mounds topped with wooden decks surround the site. Presumably these structures are lookout platforms. On the south side of the site, one of the platforms is on top of what appears to be soils removed from the trench that traverses the site. This would indicate that the site was emplaced after the trench was dug and would account for the trench being backfilled at the center of the site. The trench that traverses the site from northwest to southeast may have been the location of a temporary water supply pipeline that ran from the pre-Hanford Allard pumping station to the 200 North Area and the Central Electrical Control Station located in the 200 North Area. The entire length of this trench was traced for the Technical Baseline Document (WHC-SD-EN-TI-239). At least three large wooden bunkers with earthen berms surrounding the sides were also located in the area. The wooden roofs, made up of 20.3 centimeter by 20.3 centimeter (8 inch by 8 inch) beams have collapsed into the structures. The overall site covers an area of approximately 6.07 hectares to 8.1 hectares (15 to 20 acres).
In 1997, the debris was determined to be non-hazardous and the waste site was reclassified to rejected.

**Location:** The site is located south of 100-K Area on the south side of Route 1. The access road to the site leaves Route 1 about 0.9 kilometers (0.6 miles) west of the railroad crossing located just west of the entrance to 100-K.

**Waste Type:** Chemicals

**Waste Description:** This unit contains various types of solid wastes including old food containers, 18.9 liter (5 gallon) gas and oil cans, empty ammo crates (confirmed to be empty), and two piles of coal approximately 6.1 meters (20 feet) in diameter. In addition to old military containers and ammo boxes, a 18.9 liter (5 gallon) drum with holes in the bottom was found. The drum was partially buried and appeared to be some type of french drain or sanitary sewage facility (latrine).

Location: The site is located northeast of 100-F Area, (NW 1/4 Section 24, T 14N R 27E, 1/4 mile east of sections 13,14,23,24) at the road terminus west of PSN 12/14, and about 3 miles east of the White Bluffs landing.

Related Sites/Structures: 600-6 MIL-H-12L Battery B Launch Site.

Waste Type: Process Effluent

Waste Description: Wastes identified at the unit include a 5-gallon can of military lubricant (containing minimal amounts of free product), wire, several paint and lubricant cans, and some re-bar associated with building foundations.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
**Location:** The site is located northwest of 100-B/C Area on the opposite side of the Columbia River (N 1/2 of SW 1/4 Section 28, T 14N R 25E).

**Process Description:** In 1954, 81-R was situated near PNS 80 to support the Anti-Aircraft gun system. By 1955, 81-R was moved to near 83-C. The nature of the equipment and structures (if any) are unknown.

**Waste Type:** Process Effluent

**Waste Description:** Wastes identified at the unit are miscellaneous surface debris including batteries, bottles and a buried, open-top 55-gallon drum.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

### Code: 600-12

**Classification: Accepted**

**Reclassification:** Rejected (1/30/2003)

**Names:** 600-12; Battery C Control Center; MIL - H-83C

**Type:** Military Compound

**Status:** Inactive

**Start Date:** 1/1/1956

**End Date:** 1/1/1960

**Description:** The waste site has been evaluated and reclassified to Rejected. This unit is an abandoned control center for the battery C Nike missile site.

**Location:** The site is located northwest of 100-B/C Area on the opposite side of the Columbia River (SW 1/4 of NW 1/4 Section 28, T 14N R 25), 1/4 mile east of SR 24, the north-south road, near top of the bluff.

**Related Sites/Structures:** PSN 80 (sites 600-75 and 600-13) and 600-11.

**Waste Type:** Process Effluent

**Waste Description:** The unit waste includes several hundred rounds of spent 30/06 casings, steel links for belt-fed automatic weapons, and several tires.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

### Code: 600-13

**Classification: Accepted**

**Reclassification:** Rejected (1/30/2003)

**Names:** 600-13; Battery "C" Launch Site; MIL - H-83L; PSN 80

**Type:** Military Compound

**Status:** Inactive

**Start Date:** 1/1/1955

**End Date:** 1/1/1974

**Description:** The waste site has been evaluated and reclassified to Rejected. This unit is an abandoned military installation. Buildings and other above ground structures have been removed. Underground structures have been backfilled.

The Air Defenses of Hanford: Camp Hanford The Forward Positions 1950-1964 descriptive summary (Anonymous 1993) states there were 15 aboveground structures (including barracks, paint, oil, and acid storage), a septic system, and assorted "miscellaneous tanks." The barracks were located about 0.4 kilometers (0.25 miles) away from the launch site. The summary also...
reported that the site is "destroyed;" the AEC cleanup was from May to July 1974. The ammunition magazines were detonated in June 1974. The adjacent PSN 80 was merged with this site after 1956 (Anonymous 1993).

Location: The site is located northwest of 100-B/C Area on the opposite side of the Columbia River (SW 1/4 Section 16, R 14N R 25E) It is at the end of a paved access road.

Related Sites/ Structures: 600-11, 600-12, 600-75, 600-18 and 600-96

Waste Type: Process Effluent

Waste Description: Wastes identified at the unit are miscellaneous disposal area debris, material from 1960's practice maneuvers, and miscellaneous trash scattered over a 50 acre area.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

Code: 600-14
Names: 600-14; MIL - PSN 01
Type: Military Compound
Status: Inactive

Classification: Accepted
Reclassification: Rejected (1/30/2003)
Start Date: 1/1/1960
End Date: 

Description: The waste site has been evaluated and reclassified to Rejected. The unit is an abandoned military tent camp and anti-aircraft battery site. During the April 1999 site visit, no foundations were observed but several regular shaped disturbed areas and chunks of concrete were visible. What appeared to be an abandoned well was found under a removable metal cover. There is an area of erosion or subsidence with exposed concrete along the edges. Circular areas with little or no vegetation were also seen around the site. Mature trees, grasses and 0.6 to 1.2 meter (2 to 4 foot) tall sagebrush cover the site. There is an underground septic tank and drain field may still exist as there is no record of them being removed. The well that serviced the position was 892 feet deep, and drilled in 1953.

Location: The site is located north of the Columbia River, north of Highway 24, in the Wahluke Slope State Wildlife Recreation Area. It can be accessed via Gate 136. The site is approximately 1 mile north of marker 56 on Highway 24.

Process Description: Original structures at the site included a 20-foot by 34-foot aluminum pre-fab pumphouse with a concrete floor and foundation, a 550-gallon underground storage tank, and septic system. The site also had a direct communications cable connection with Headquarters site H-03-H, which was in the central region of Hanford, south of the 100-N Area. The use permit was terminated by the Atomic Energy Commission on December 21, 1960. After the site ceased to function as an AAA site, a repeater remained operational.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

Code: 600-15
Names: 600-15; MIL - PSN 04
Type: Military Compound

Classification: Accepted
Reclassification: Rejected (1/30/2003)
Start Date: 1/1/1950
Inactive

Description:
The waste site has been evaluated and reclassified to Rejected. This unit is an abandoned tent camp and anti-aircraft battery. This unit consisted of a well marked "contaminated", and foundations for anti-aircraft gun emplacements.

Location:
The site is located north of 100-H Area (SE 1/4 of NW 1/4 Section 32, T15N R27E) on the opposite side of the Columbia River.

Waste Type: Process Effluent

Waste Description:
The waste at the unit consists of several unlabeled yellow 5-gallon containers, several blue plastic 55-gallon drums that are marked with "Sterling Imaging Inc. Pasco WA." construction debris, and miscellaneous trash.

Closure Info:
Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

Code: 600-16

Classification: Accepted

Reclassification: Rejected (1/30/2003)

Names: 600-16; Base Camp 500; H-07-H; MIL - PSN 07/10; PSN 10

Type: Military Compound

Start Date: 1/1/1952

End Date: 1/1/1961

Description:
The waste site has been evaluated and reclassified to Rejected. This site is an abandoned military installation. The site includes a small burial site on the southern edge of the camp site, a large dump southeast of the camp in a shallow gully, a well, and an 8 foot by 8 foot underground room. All of the buildings have been removed.

Location:
The tent camp PSN 12/14 was located NW 1/4 of NE 1/4, Section 24 T14N R27E, at the end of
the road leading east from White Bluffs landing. Only paved and dirt roads remain.

**Related Sites/Structures:** Site 600-74 is northeast of this site, and was another dumping area for this tent camp.

**Waste Type:** Soil

**Waste Description:** The waste at the unit consisted of metal scraps, old paint cans, commissary-type waste (e.g., food cans, condiment containers and beer bottles), washing machine parts, a water tank, a water heater, 1-gallon solvent cans, and artillery shell packing boxes marked 120 M.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

### Code: 600-18

**Classification:** Accepted

**Names:** 600-18; H-82; MIL - PSN 72/82; PSN 72; Tent Camp 515

**Reclassification:** Rejected (1/30/2003)

**Type:** Military Compound

**Start Date:** 1/1/1951

**End Date:** 1/1/1961

**Description:** The waste site has been evaluated and reclassified to Rejected. The site is an abandoned military tent camp site and anti-aircraft battery. The unit consisted of a few small disposal pits and piles located west of the road and a small firing range located at the northeast corner of the unit. The site also contained a pumphouse and a 500 gallon underground tank. A disposal area was identified with a considerable amount of surface debris; all debris has been removed.

**Location:** The site is located northwest of 100 B/C on the opposite side of the Columbia River (SW 1/4 Section 31, T 14N R 25E) Parts of it are on both sides of a small highway heading north from Vernita Bridge, around a group of trees at the top of the hill.

**Process Description:** The gun emplacements and all the facilities except for the septic system and roads were removed during the 1974 cleanup.

**Waste Type:** Animal Waste

**Waste Description:** The unit contained wood debris, empty 5-gallon and 1-quart oil cans, an empty 5 gallon can of lubricant, artillery packing materials, two partially buried plywood boxes, ash, communications wire, cable, lead and brass. The unit also contained a septic tank.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

### Code: 600-19

**Classification:** Accepted

**Names:** 600-19; Base Camp 410; H-90; MIL - PSN 90

**Reclassification:** Rejected (1/30/2003)

**Type:** Military Compound

**Start Date:**

**End Date:**

**Description:** The waste site has been evaluated and reclassified to Rejected. This is an abandoned anti-aircraft military installation. Before final cleanup in 1994, structures included a concrete foundation pad, an abandoned well, cinderblock well pumphouse with a 550 gallon underground tank, a usable well, abandoned well, and a recently used old oil rack and grease
pit, wash platform, generator shed, septic system, and support facilities. Other unit features include an old dumping ground (located south of Highway 24), several trash pits, and a 10 feet by 15 feet by 4 feet deep trench.

During the April 1999 visit, several concrete foundations and walkways were observed, as well as a stone wall, earthen mounds and a small cinderblock structure. Mature trees are growing around the abandoned installation.

**Location:** The site is located north of the Columbia River in the Saddle Mountain National Wildlife Refuge. Most of the site is located north of Highway 24; however, an old dumping ground is described as being located south of the highway.

**Related Sites/Structures:**
- Military motor pool

**Waste Type:** Process Effluent

**Waste Description:** Unit waste consists of small amounts of refuse including tent parts electrical parts, automobile parts, and sand bag material. In addition, a small area of the ground was oil stained near the oil rack.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

**Code:** 600-20  
**Classification:** Accepted  
**Reclassification:** Rejected (10/1/1997)

**Names:** 600-20; 615 Hot Mix Plant for Road Materials; Tank Cleaning Site

**Type:** Depression/Pit (nonspecific)  
**Status:** Inactive

**Description:** The site is described as two abandoned asphalt tanks, each with a volume capacity of 45,420 to 52,990 liters (12,000 to 14,000 gallons). A 1999 waste site walkdown identified several valve pits, and a depression which contains discarded asphalt material, several pails and drums. Waste asphalt, dumped in solid and liquid form, is prevalent at the site, as is other construction and equipment debris. In warm weather, the discarded asphalt liquefies and resembles puddles. The asphalt puddle in the depression (trench) south of the tank area was approximately 0.3 meters (1 foot) deep in May and June 1999.

**Location:** The site is located on the west side of the Hanford Townsite, south of the railroad tracks. The two remaining tanks are 600 meters (1968.6 feet) west of Route 2 North.

**Process Description:** The Hot Mix Plant for the preparation of bituminous road surfacing materials was originally erected for temporary and permanent road construction. This Plant was a "TC" (temporary field construction) plant that continued to operate after the construction phase. It was located along the south side of a railroad spur and just east of the former Hanford Aggregate Pit. The Plant was rated at 3/4 to 1-1/4 cubic yards per minute and consisted mainly of eight horizontal oil storage tanks; a Barber-Greene, Model #843, Central Mixer for single aggregate, and a Model #833 Single Drum Dryer; and Steam Facilities. At the close of construction, the above facilities were transferred to the Operating Department and assigned permanent building number 615. The horizontal oil storage tanks were arranged in a single row at the foot of the railroad fill to provide a gravity flow for unloading operations. Six of the tanks, measuring 1.5 meters (5 feet) in diameter and 7.3 meters (24 feet) in length, were supported by reinforced concrete cradles. Two of the tanks, measuring 3.0 meters (10 feet) in diameter by 7.3 meters (24 feet) in length, rested on the ground surrounded by an earthen dike. All tanks were provided with wooden
frame access platforms and stairways.

Waste Type: Process Effluent
Waste Description: The remaining waste is located in the pit. The floor of the pit is coated with asphalt.

Description: The Technical Baseline Report states the site consists of a 2.4 meter (8 foot) excavation containing a construction refuse burn pile. However, it also states that the author was unable to locate the site in the field. This site was originally identified as a "mystery site" by Richard Roos. In his field notes, Roos describes the site as "old burn pile, apparently a construction disposal location. Site is graded off, perhaps 8' below original grade." He then goes on to describe various features north of the site, such as 600-20 (The Tank Cleaning Site) and several gravel pits. Under "Unusual or Identifying Features," Roos lists "very large spikes (10" x 1/2"), molten glass and metal, wood ashes. A dump site for concrete building foundation is located behind the soil mound..." The site is described as being east of this soil mound. This soil mound with the concrete chunks on its west side is easy to find and can be seen from Highway 2 North. The mound is found in a large excavated area. The excavation was made into the side of a slope and is not a typical borrow or gravel pit. It increases in depth from east to west. The area east of the soil mound and within the excavated area appears to coincide with Roos' description. However, there appear to have been several areas of burning, not just a single burn pile. The spikes, molten glass and wood ashes described by Roos were found in this area during the June 1999 visit.

Location: The site is located west of Route 2 North and south of an access road leading to 600-20, the "Tank Cleaning Site." The site is between wells 699-54-18E and 699-54-19 and east of a large soil mound.

Waste Type: Soil

Waste Description: Unit wastes include construction debris and possible asbestos and barrels.

Description: The site contains wells, valve pits, foundations, and a dumping area. The site has four monitoring wells identified as follows: 6-54-18A, A8855; 6-54-18B, A8856; 6-54-18C, A8857; 6-54-18D, A58858. Note that 6-54-18C is an alias for 699-54-18C. The second identifier...
beginning with an alpha character is a barcode value located on all wells that are presently used by the samplers during the collection of samples and groundwater elevations. The well named 699-50-18C, DC-6 does not exist either in the Hanford Environmental Information System (HEIS) database or in historical well documents. Two ex-Basalt Waste Isolation Project (BWIP) personnel were also consulted about this well. Both persons stated that the well does not exist and that the picture shown in the Technical Baseline Report is not an old BWIP well. The two other sites that were previously identified as "wells" (see photograph in the Technical Baseline Report) are likely to be valve pits for water utilities and are marked with four steel posts surrounding the pits. The easternmost pit has been filled in with soil and a concrete structure can be seen just under the soil. The other pit has a wooden cover and had two water pipes protruding through the cover. One water pipe was approximately 7.6 centimeters (3 inches) in diameter and was open ended. The other pipe was approximately 2.54 centimeters (1 inch) in diameter and had a faucet (garden hose type) attached to the end. In addition, two valve handles also protruded from the wooden cover. Two power poles were observed between the wells and Route 2 North. The power poles appeared to be active and the breaker switches were not locked out. Evidence of former buildings shows up between the well house and Route 2 North. Building debris includes concrete footings, concrete pads, transite, sewer pipe, electrical wiring and a large diameter clay pipe approximately 0.77 meters (30 inches) in diameter buried vertically from the surface to approximately 2 meters (6.5 feet) below grade. The clay pipe has no incoming/outgoing pipes. The area surrounding the wells show evidence of former roads and walkways that have been overgrown with weeds.

Location: The site is located approximately 0.5 miles west of the old Hanford School, 45.7 meters (150 feet) east of Route 2 North, and on the south side of a dirt road formerly known as Roosevelt Avenue.

Waste Type: Process Effluent

Waste Description: The original waste site package identified that chemical analysis of the monitoring well shows volatile organics. No evidence has been found to support this claim. In order to substantiate this information, the HEIS database was searched for groundwater monitoring wells near the area. The following wells were searched for volatile organics: 699-54-18E, 600-54-19, 699-52-18A, 699-52-18B, 699-52-18C, 699-52-19, 699-52-17, 699-54-18A, 699-54-18B, 699-54-18C, 699-54-18D, 699-54-15A. The results are as follows: Well Number 699-54-18D, Sample Number B07Q48, Date 11/24/92, Constituent 67-64-1, Acetone, 190 micrograms per liter; Well Number 699-54-18D, Sample Number B075S7, Date 11/17/92, Constituent 108-88-3, Toluene, 6.1 micrograms per liter; Well Number 699-54-18D, Sample Number B07Q48, Date 11/24/92, Constituent 108-88-3, Toluene, 5.69 micrograms per liter; Well Number 699-54-18D, Sample Number B01NN6, Date 11/24/92, Constituent 108-88-3, Toluene, 5.2 micrograms per liter. HEIS for Well 699-48-18 was searched for volatile organics. The results are for Sample Number H000DQT1, Date 8/25/87, Constituent 75-09-02 methylenechloride, analytical method id = 16, 80 micrograms per liter. A later sample for the same well showed Sample Number B08185, Date 1/28/93, Constituent 75-09-02 methylenechloride, analytical method id = 83, 5 micrograms per liter (below minimum detectable concentration). Other wells had no volatile organics or the results were below minimum detectable concentration. Some asbestos transite is visible in the area.

Code: 600-31
Classification: Accepted
Names: 600-31; 100-F Area Bottle Disposal Site
Reclassification: Rejected (7/29/1997)
Type: Dumping Area
Start Date:
Status: Inactive
End Date:
Description: The site is a sandy area with rabbitbrush growing throughout. It exhibits physical evidence that the dumping of laboratory materials took place. The area also appears to have been disturbed.
by a blade or bulldozer. During the April 1999 visit, scattered debris was visible, composed primarily of glass with some metal and wood debris. The glass is found in a swath on the west side of a sandy rise. There is a moderate vegetation cover of rabbitbrush and grasses on the sandy rise with less cover on the disturbed ground.

Location: The site is located approximately 91 meters (300 feet) north of the southeast corner of the perimeter road and approximately 9.1 meters (30 feet) east of the perimeter road.

Waste Type: Process Effluent

Waste Description: Wastes identified are laboratory-type bottles and bottle caps with the following markings on some of the caps: 1) Sulfuric, 2) Mallinckrodt, 3) Bakers, 4) B & A, 5) Fisher. The markings and colors on the bottles and caps indicate they most likely contained laboratory chemicals (e.g. nitric acid, sulfuric acid, hydrochloric acid, etc).

---

Code: 600-32
Names: 600-32; N Area Landfill
Type: Dumping Area
Status: Inactive
Description: A field walkdown done in August 2000 compared the site to the area mapped in Arcview and found it to be a duplicate of 100-N-39 and 100-N-19 (it is contained within the much larger 100-N-19). The site is a large area covering approximately 13 hectares (32 acres), consisting of an abandoned gravel pit and several other depressions which were used as dumping areas for 100-N Reactor and the Hanford Generating Plant (HGP). The main gravel pit depression is approximately 6 meters (20 feet) deep and is located southwest of the HGP facility fence. A steel casing, described as a well head, is located near the northern edge of the unit. Large concrete blocks, a burning area, broken glass, a sandblast material pile, and other debris is scattered across the bottom of the site.

Location: The unit is about 300 meters (1000 feet) south of the 100-N Hanford Generating Plant (HGP) and Bonneville Power Administration (BPA) Hanford Substation facility fence.

Related Sites/Structures: This site is associated with 100-N-19 (it is contained within the larger site 100-N-19), 100-N-39 (it is a duplicate of 100-N-39), and 100-N-18 (a smaller burning/dumping area about 270 meters (900 feet) north, just south of the HGP fenceline.)

Process Description: The site was used as a dumping area for 100-N Area and the Hanford Generating Plant.

Waste Type: Soil

Waste Description: Unit waste includes 19-liter (5-gallon) paint cans (one labeled SCC Portland 26 5 65, one labeled USS 5-28/26-65, one labeled ICC=37-76-80 NRC, others are crushed), sheet aluminum, steel pipes, rebar, transite, cans wood, two 208-liter (55-gallon) drums (one labeled Delvac 1330 SAE-30 motor oil), concrete, wire, cable and spools, bottles (soda pop and amber 3.8-liter [1-gallon] jugs), broken fluorescent and incandescent light blubs, tires, grass clippings and miscellaneous construction debris.
Description: The waste site was a temporary burial site for the 105-C Reactor Test Loop.

Location: Five locations were identified as possible locations for the site, including the one listed as 90 to 120 meters (300 to 400 feet) south of the 105-C Reactor Fan Room (E 565368.938, W 143846.781). Trenches, aka potholes, were dug at (1) E 565369, N 143847, (2) E 565369, N 143916, (3) E 565372, N 143916, (4) E 565371, N 143940, (5) E 565855, N 143769.

Process Description: The selected design for the test loop was a tube within a tube (annular design). The outer tube was a 3.8-centimeter (1.5-inch) inside diameter Schedule 160 stainless steel tubing. The inner tube was 2.5-centimeter (1-inch) inside diameter with 0.17-centimeter (0.065-inch) wall thickness within a 12-meter (40-foot) carbon steel shield tube. The test loop was inserted into the south side of the C Reactor core (one of the channels) and was used to test the effects of ionization on various chemicals being considered for reactor process tube scaling and cleaning.

Waste Type: Process Effluent

Waste Description: The waste consists of a radioactive double-tube test loop, contaminated carbon-steel shielding pipe, and about 305 meters (1,000 feet) of cable used to remove the test loop from the 105-C Reactor. The test loop is approximately 5.5 to 6.1 meters (18 to 20 feet) long and consists of various sizes of stainless steel tubing. The test loop may have dose rates in excess of 100 rads/hour. Potential contaminants include: Co-60, Ni-63.
Vehicle maintenance with a mechanic's pit: 30 meters by 14 meters (97 feet by 47 feet). While the pit is filled in with tumbleweeds making observation of the floor impossible, it is likely concrete. It is unlikely that oil would have been allowed to drain freely in the pit, since mechanics would have had to work in the oil while servicing the vehicles. #2. Kitchen/mess: 12 meters by 10 meters (40 feet by 32 feet). #3. Toilet/showers: five visible toilet drains and two floor drains visible, along with a metal box inset in the foundation, presumably with a water valve inside. The foundation is partially covered with sand. #4. Concrete pad: 9 meters by 6 meters (30 feet by 21 feet). #5. Concrete pad: 15 meters by 6 meters (50 feet by 20 feet). Seven circular ammunition storage berms constructed of wood, sandbags, rock and soil measuring approximately 18 meters (60 feet) in diameter are also present. The July 2000 fire did not affect these bunkers. Very little debris is present, just a couple of empty 5-gallon oil cans (no leaks onto soil are evident), and fencing material in two piles (site 600-223).

Location: The unit is located at the southwest quarter of Section 19, Township 12 North, Range 26 East, 3.2 kilometers (2 miles) south of the 200 West Area and 0.4 miles east of the Rattlesnake Barricade on SR 240.

Related Sites/Structures: The septic system associated with this site is 600-224. Site 600-223 is the associated pits containing fencing material.

Process Description: This was the site of a U. S. Army anti-aircraft gun installation. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Waste Type: Soil
Waste Description: The waste includes concrete walkways, concrete foundations, and ammunition storage berms constructed of wood, sandbags, rock and soil.

Code: 600-41
Classification: Accepted

Names: 600-41; H 70 Anti-Aircraft Artillery (AAA) Site
Type: Military Compound
Start Date: 1/1/1951
End Date: 1/1/1963

Status: Inactive
Description: The waste site has been evaluated and reclassified to Rejected. The items were removed as "landlord items". It is an abandoned Military Installation (H-70) consisting of a few covered foundations and cleared areas. Some man-made mounds were present. There is a paved road and a few trees at the site.

During the April 16 and April 19, 1999 site visits, two earthen mounds were observed as well as the remains of several foundations. The site was overgrown with approximately 0.9 meter (3 foot) tall sagebrush, making it difficult to discern either features or the edges of the site. There were several open areas covered with cheatgrass. Scattered pieces of metal, concrete, glass and transite were observed. A burn pit/dump had traces of burned wood, glass and transite. A burrow going into the center of the dump also shows buried glass.

Location: The unit is located approximately 4.2 kilometers southwest of the Vernita Bridge rest area. The
This camp is the site of an antiaircraft battery. Structures reported to have been at the site include administration, classroom, supply and day rooms, barracks, and latrine facilities. The electrical power was provided by overhead wires; water supplied by the "McGee Well;" and the camp was serviced by a septic tank and drain field.

Sitecodes 600-41, 600-42 600-43 and 600-45 were grouped onto one Reclassification form in 2002 and their status was changed to Rejected. The sites were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

The waste site has been evaluated and reclassified to Rejected. It is an abandoned military installation. The structures have been removed. The site is accessed by a northeast trending primitive road that runs through it. Berms run along the south side of this road and the remains of barbed wire fences were visible on either side. Well 699-68-105 is located near the northern edge of the site. The marker for this well is a good landmark. Most of the evidence of the site is found on the north side of the road.

During the April 16, 1999 site visit, evidence of a small tile field was found. It appeared as though the septic tank associated with the tile field has been removed or has collapsed. A pit that could have housed a second septic tank was found on the south side of the road that runs through the site. No evidence of a second tile field was found. A concrete walkway and a rock walkway were found. Wood debris, glass and concrete chunks were found, as well as a metal lid stamped "120 MM GUN" and "CONT M79A." An approximately 1.2 meter (4 foot) by 2.4 meter (8 foot) underground bunker was discovered. Its wooden roof is collapsing and presents a physical hazard. The depth of the bunker could not be estimated. Numerous areas with little or no vegetation were also observed around the site. Evidence of an old orchard can be found north of the site. The orchard can be seen in photo # 02646. Within the old orchard is an earthen mound with vegetation growing on its sides but not on its crown.

The site is located approximately 1.6 kilometers southwest of the Vernita Bridge rest area on Highway 24.

Sitecodes 600-41, 600-42 600-43 and 600-45 were grouped onto one Reclassification form in 2002 and their status was changed to Rejected. The sites were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
Location: The site is located northwest of the Yakima Barricade, west of Highway 24, approximately 45 meters (147.6 feet) north of well 699-53-103.

Related Sites/Structures: McGee Wellhouse (699-53-103) is associated with the unit.

Process Description: The site was used in the early 1970's as a commercial tropical fish farm. The site was chosen because the well at the McGee Ranch supplied unusually warm water. Ponds were excavated, lined with black plastic and fed with water from PVC piping. It is believed to have operated only one or two years and then was abandoned.

Waste Type: Process Effluent

Waste Description: The unit waste includes broken plastic pipe, plastic sheeting, wood, metal, glass debris and an abandoned vehicle.

Closure Info: Sitecodes 600-41, 600-42 600-43 and 600-45 were grouped onto one Reclassification form in 2002 and their status was changed to Rejected. The sites were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

Code: 600-45
Names: 600-45; Transite and Metal Debris Pile
Type: Dumping Area
Status: Inactive
Description: The waste site has been evaluated and reclassified to Rejected. The items were removed as "landlord items". The site is not marked or posted. It consisted of piles of debris scattered on the ground surface. The area was approximately 500 square meters (5,382 square feet) that ended at a cliff.
Location: The site is west of Highway 24 on Umtanum Ridge. It is 1.6 kilometers southeast of the Midway Substation.
Related Sites/Structures: This site was associated with the H-70 Anti-Aircraft Artillery (AAA) Site (WIDS site code 600-41).
Waste Type: Soil
Waste Description: The unit waste includes broken transite shingles, pallet banding straps, exhaust stack made from drums, miscellaneous military food cans and a couple of drums that were rolled off the cliff.
Closure Info: Sitecodes 600-41, 600-42 600-43 and 600-45 were grouped onto one Reclassification form in 2002 and their status was changed to Rejected. The sites were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
on the northeast corner of the site. Previous documentation describes the mounds as thought to contain waste construction materials, such as, wood, bricks, melted plastics and ceramics. However, the man made mounds were created when the surface was bulldozed in preparation for the coal pile. No waste materials are in evidence.

Location: The site is located approximately 200 meters (656 feet) north-northeast of the old Hanford High School and northwest of the pump house. It is on the east side of Avenue A.

Waste Type: Process Effluent

Waste Description: The waste is coal dust remaining from the coal that was stored at the site.

---

### Code: 600-53
### Classification: Not Accepted

### Names: 600-53; H-51 Anti-Aircraft Artillery Site Building Foundations

### Type: Foundation
### Status: Inactive

### Description: Six building foundations and concrete pads were observed at this site and are described as follows: #1. 12.5 meters by 10 meters (41 feet by 33 feet), concrete foundation with 4 floor drains. #2. 15.6 meters by 6.1 meters (51 feet by 20 feet), concrete pad with 8 toilet drains and 11 sink/floor drains. #3. 6.1 meters by 15.3 meters (20 feet by 50 feet), concrete foundation. #4. 6.7 meters by 15.3 meters (22 feet by 50 feet), concrete foundation. #5. 5.5 meters by 3.3 meters (18 feet by 11 feet), Concrete pad. #6. 7.3 meters by 5.8 meters (24 feet by 19 feet), Concrete pad.

### Location: The H-51 Gun Site is on Army Loop Road, southwest of 200 West Area. This site is located in the southeast quarter of Section 15, Township 12 North, Range 25 East.

### Related Sites/Structures: The site's dumping areas are 600-220; 6607-3 is the site septic system.

### Process Description: This is the location of a former U. S. Army anti-aircraft gun site. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Waste Type: Process Effluent

Waste Description: Concrete building foundations and concrete pads

---

### Code: 600-55
### Classification: Accepted

### Names: 600-55; Paved Area and Collapsed Structure

### Type: Dumping Area

### Start Date: 1/1/1958

### End Date: 1/1/1998

### Reclassification: Rejected (10/1/1997)
Description: The site is a dumping area that consists of an asphalt paved area which may have been a parking lot, miscellaneous farm debris and a collapsed wooden building. The pre-Hanford farm debris is scattered approximately 135 meters (443 feet) to the east of the paved area. There is also a cellar and an old stove near the collapsed wooden structure.

Location: The asphalt paved area is located to the west of the 100K Area, southeast of the Allard Pumping Station and to the southwest of the 128-K-2 Burn Pit.

Waste Type: Soil

Waste Description: The miscellaneous debris at the site consists of asphalt paving, empty paint and paint solvent containers, an empty antifreeze container, a fan belt, wood, and metal.

---

Status: Inactive

Description: The site is the abandoned waste from what appears to be a pre-MED (Manhattan Engineering District) farm. The site is identifiable by scattered debris, piles of rocks, and an excavated pit.

Location: The site is located southwest of the 128-B-2 Burn Pit and south of well 699-71-77.

Waste Type: Process Effluent

Waste Description: Several aging dry cell batteries were found at the site. In September 1997, a field visit was performed by B. D. Schilperoort. He examined the batteries and noted that they appeared to have been in a fire. Some material was removed from the inside of a battery surrounding a carbon electrode. A 50/50 test for corrosivity found neutral pH. A lead test swab found no evidence of lead. The conclusion based on the field investigation was that no hazardous constituents remained in the batteries.

---

Status: Active

Description: The waste site consisted of potential contamination of the soil from the electrical equipment at the substation.

Location: The substation is located northwest of the Hammer Training Facility off of Horn Rapids Road. The site name has nothing to do with the location.

Process Description: The electrical equipment at the substation included transformers, couplings, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Release occurred from storage tank No. 2.
Waste Type: Process Effluent

Waste Description: The White Bluffs Substation used petroleum oil, primarily mineral oil, as insulation in electrical equipment. Insulating oil was a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-tertbutyl-paracresol (an antioxidant known as BHT that was also used as a food additive) and varying amounts of polychlorinated biphenyls (PCBs) to increase dielectric strength. The aboveground tanks contained mineral oil which was used as make-up oil for equipment maintenance or cleaning.

Code: 600-62  
Names: 600-62; Benton Switch Substation Releases  
Type: Unplanned Release  
Status: Active  
Classification: Accepted  
Reclassification: None  
Start Date: 1/1/1948  
End Date:

Description: The substation is currently active and is enclosed in a locked, chain link fenced area. It began operations on November 11, 1948. The site contains various electrical equipment, circuit breakers, transformers, tanks, and support facilities. The primary environmental concern stems from leaking insulating oil from transformers and circuit breakers. A site visit on November 20, 1998, observed several areas of discolored gravel and stained concrete beneath vessel valves.

Location: The substation is located northwest of the northernmost tip of Wooded Island, near the river, at the north end of a gravel utility access road. It is east of the Energy Northwest (Washington Public Power Supply System) property.

Release Description: A number of releases have been associated with the facility. (See releases section). The switchyard has had past mineral oil spills and detections of polychlorinated biphenyls (PCBs) in the soil.

Process Description: This substation is part of the Bonneville Power Administration main transmission grid, that conducts electrical power from the Columbia and Snake Rivers dams to five states (Washington, Oregon, Idaho, western Montana, and northern California). The BPA transmission grid is divided into four subareas. The substations on the Hanford Site are within the Snake River subarea. The substations use petroleum oil, primarily mineral oil, as insulation in electrical equipment. This includes transformers, coupling and potential devices, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Insulating oil is a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-tertbutyl-paracresol (an antioxidant known as BHT that is also used as a food additive) and varying amounts of polychlorinated biphenyls (PCBs) to increase dielectric strength. All of the substations have above ground tanks of mineral oil, that is used as make-up oil for equipment maintenance of electrical equipment. Solvents are used for cleaning and degreasing operations. Once maintenance is completed, rags soaked in solvent and all personal protective clothing are to be placed in drums for transport to the generator storage area at the H. J. Ashe Substation. All equipment filled with mineral oil is regularly analyzed for PCB concentration. All untested and unmarked equipment is assumed to be PCB contaminated. Electrical equipment fluid is assumed to be PCB, if the manufacturer's manuals or nameplates do not identify the type of dielectric fluid in the equipment, or if the equipment is known to be PCB according to available information.

Waste Type: Chemicals

Waste Description: The waste is soil potentially contaminated with polychlorinated biphenyls (PCBs) (Aroclors 1254 and 1260), insulating oil (10-weight petroleum oil with 0.1% 2,6-di-tertbutyl-paracresol). Mineral oil containing PCBs and solvents are the hazardous constituents used at the site.
Reclassification: 600-64; Sanitary Waste Tie-Line from the 400 Area to WPPSS; Underground Sanitary Sewer Line from 400 Area to WPPSS

Names: 600-64
Type: Sanitary Sewer
Status: Inactive
Start Date: 1/1/1997
End Date:

Description: The wastewater line was isolated by plugging it with concrete in December 2013. The underground, gravity flow line began at the inlet to the 4607 Sanitary Sewer septic tanks and connected the 400 Area sanitary sewer main (also known as the 4903 Sanitary Sewer Main) with the Washington Public Power Supply (later renamed Energy Northwest) System sewage treatment facility. The sewer line route appeared as a disturbed area covered with sand and little vegetation. Washington Public Power Supply System (later renamed Energy Northwest) signs were posted along the route mark the existence of an underground sewer line.

Location: The sewer line extended eastward from the existing 400 Area Septic Tanks (WIDS Site 400-7) to the existing Washington Public Power Supply System (later renamed Energy Northwest) sewer line. The line crosses under the Route 4 South highway. The tie-in is located approximately 4.8 kilometers (3 miles) northeast of the 400 Area.

Related Sites/Structures: The site is associated with the 4607 Sanitary Sewer, 4607 Sanitary Tile Field, 4607 Sanitary Sewer Lagoon, and the 4903 Sanitary Sewer Main.

Waste Type: Sanitary Sewage
Waste Description: Site personnel report that a small amount of sanitary wastes was unintentionally discharged into the tie-line (and, thus, the WPPSS sewage treatment facility), prior to reaching agreement with WPPSS in late 1992. The sanitary wastes remained with the underground tie-line and the treatment facility. No wastes were released to the environment. Radiation detection systems in the treatment facility indicated the presence of radioactive cobalt, cesium, and tritium beyond set limits. However, only tritium was confirmed to have been present in the sanitary wastes from the 400 Area. Water from 400 Area wells contains elevated levels of tritium, which may explain the presence of tritium in sanitary wastes.

Code: 600-67
Names: 600-67; Bruggemann's Fruit Storage Warehouse
Type: Storage
Status: Inactive
Start Date: 1/1/1922
End Date: 1/1/1943

Description: The Bruggemann's Warehouse site is the remaining single story warehouse, associated foundations, piping, and debris surrounding the site. During 1998 and 2000 field visits, an abandoned fuel tank was identified adjacent to the warehouse. The tank has a 0.6 meter (2 foot) filler pipe showing above ground. All other pipes seen in the area could be attributed to the facility water system. The building is considered culturally significant because of its good condition and use of native materials for construction. It is in the process (as of January 2001) for listing on the National Register of Historic Places. The main warehouse construction consists of local cobblestones in a concrete matrix. An extension of similar construction is present on the south end; it is unknown if this is original to the building or a later addition. The long axis of the warehouse runs north-south. The horizontal wood sheathing of the gable roof is still present on the rafters. On the southeast corner, however, the roof has caved in. Small nails in the roof sheathing indicate that shingles were probably present at one time. The roof overhangs the east and west walls. A cobblestone chimney emerges from the crest of the gable. The chimney was constructed of concreted cobblestones and extends upward from the roof's peak. It appears to have been the building's only heating device. Its location suggests it was used to vent heat from chimneys, an exterior chimney is not visible.
near the south end of the roof. On the west elevation, there is a distinct straight line of cobbles running along the length of the wall about 3 feet (0.9 meters) above grade. A wooden door with a wood frame is in the center of the elevation. On the south edge of the doorway is a wooden plank off its hinges that looks like a garage door. The doors are orange with dark brown decorative trim and each bears two wood frame windows. The north half of this wall has a distinctly straight line of cobbles about 2 feet (0.6 meters) above grade, similar to the west and north walls. On the south wall of the warehouse, there is a wood frame doorway just east of center. The cobblestone extension at the south end of the warehouse is missing its roof. Above most of the structure's doors and windows, the cobblestones are arranged to form decorative arches. The east wall appears to be the main entrance. On all four corners of the building and in the center of the east wall, decorative columns taper diagonally from the ground to the top of the wall. There is a wood frame doorway near the south end. A tall wood frame window south of the door, and two similar windows are north of the door. On the west wall is a single window. The north wall of the extension faces the warehouse, and there is approximately 1 meter (3 feet) between the two walls. In the center of the wall is a doorway with a small square window east of it. A large pile of cobbles lies outside the chain link fence south of the extension. Foundations to the east of the warehouse show other facilities related to fruit packing. A possible fruit washing facility shows evidence of two parallel tables with troughs underneath for draining. Also east of the warehouse is a round concrete foundation with heavy steel eyebolts, presumably to support a tank for pressurized water.

**Location:** The site is located approximately 1.1 kilometers (0.7 miles) east of the Vernita Bridge and State Highway 240. On the Hanford Site, the site may be accessed via Route 6 between miles 6 and 7.

**Related Sites/Structures:** Remnants of previous structures at the site include a concrete pad located approximately north of the warehouse, and a concrete walkway that runs from the east side of the warehouse to a rectangular concrete foundation approximately 12 meters (40 feet) by 24 meters (80 feet). East of the foundation is the circular concrete foundation for the water tank, approximately 6 meters (20 feet) in diameter. West of the warehouse is the remnant of a house foundation. The area surrounding the warehouse consists of agricultural debris including vitrified clay piping for irrigation, dead fruit trees, and fencing material.

**Process Description:** The following comments on life at the site (1937 - 1943) are from a telephone interview with Mary Bruggemann (she was married to Paul Bruggemann). She is now living in Yakima. They grew peaches, cherries, a new orchard of prunes, and a few wine grapes. The site had a river pumphouse for acquiring water for the orchards. Native Americans were hired during harvest time to pick fruit. Fruit was transported by truck and utilized the Hanford Engineering Works (HEW) train when it first came through. They also had a lot of sheep and a few cattle. The Bruggemann's had two employees.

**Waste Type:** Sanitary Sewage

Farm debris was observed around the site including fence posts, pipe, food tins, buckets, farm machinery parts, barbed wire, and wire.

**Waste Type:** Sanitary Sewage

The underground storage tank was used for storing fuel. Approximately 5 centimeters (1.97 inches) of water and fuel residue remained in the bottom of the tank in February 1998 and September 2000.
Inactive

**Description:** The site is an area of reddish soil that was discovered while a road grader was scraping an area for installation of a pipeline. As of July 14, 1997, the stain was disappearing. Some pinkish soil is visible on the surface. The area is covered with vegetation, including cheat grass, tumbleweeds, and rabbitbrush.

**Location:** The site is located west of 200 East. It is 600 meters (1969 feet) west of the 200 East perimeter fence, west of Route 4 South, and northwest of 2704HV.

---

### Code: 600-72

**Classification:** Accepted

**Reclassification:** Rejected (1/30/2003)

**Names:** 600-72; H-12R; Wahluke Slope H-12-R Debris Site

**Type:** Dumping Area

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. The site is an abandoned military radar and dump site that ran east-west and included approximately 5 acres. A gravel road formed the perimeter of the site.

**Location:** The site is northeast of 100-F Area on the opposite side of the Columbia River (Section 23, T 14N, R 27E). The site southeast of H-12L.

**Related Sites/Structures:** PSN-12/14, H-12L

**Waste Type:** Sanitary Sewage

**Waste Description:** The primary hazard at this site is construction debris including domestic garbage, wood, oil cans, and 55 gallon drum. Visible debris has been removed.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

### Code: 600-73

**Classification:** Accepted

**Reclassification:** Rejected (1/30/2003)

**Names:** 600-73; Wahluke Slope Igloo Sites

**Type:** Military Compound

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. It is the site of two ammunition storage "igloos." The buildings have been removed and the area has been cleaned up.

**Location:** On Wahluke Slope, north of the 100 D Area at the upper east and west ends of a "T-shaped" gravel road.

**Waste Type:** Steam Condensate

**Waste Description:** The debris at this site included a stock watering drum, glass bottles, tin cans, barbed wire, and other garbage. The debris has been removed.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity.
activity, not a CERCLA activity.

_Hanford Site Waste Management Units Report_
February 2015
Waste Description: The debris at this site included building materials, insulators, glass bottles, tin cans, cable, and other garbage. Two septic tanks openings were discovered at this site. These tanks were filled with 12.2 cubic meters (16 cubic yards) of concrete. The debris was picked up. An area of petroleum-contaminated soil around a concrete well structure was excavated and five 208 liter (55-gallon) drums of contaminated soil were removed.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

Code: 600-76  
Names: 600-76; Underground Rooms; Wahluke Slope Radar Site  
Type: Military Compound  
Status: Inactive  
Description: The waste site has been evaluated and reclassified to Rejected. The site is roughly oval, approximately 400 meters (1/4 mile) by 370 meters (400 yards), and surrounded by a gravel.

Location: The site is a radar site with underground rooms on Wahluke Slope, north of the 100H area and just north of Highway 24. It is southeast of PSN 04 (600-15).

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

Code: 600-77  
Names: 600-77; Antiaircraft Gun Shrapnel Sites 1, 2, and 3; Wahluke Slope Shrapnel Sites  
Type: Military Compound  
Status: Inactive  
Description: The waste site has been evaluated and reclassified to Rejected. The shrapnel sites are three nearby but separate areas containing shrapnel from antiaircraft gun firing on the North Slope.

Location: There are three shrapnel sites located on the North Slope. Site 1 is east of 100-H area and north of the electrical transmission lines, 1/2 mile north of the White Bluffs boat landing, west of the old highway (Section 22, T 14N, R 27E). Site 2 is located northeast of 100F area, north of the railroad track, south of Highway 24, and northeast of PSN 12/14 (Section 8, T 14N, R 28E). Site 3 is located north of 100-D Area and south of the Igloo Site in the Saddle Mountain National Wildlife Refuge (Section 2, T 14N, R 26E).

Waste Type: Water  
Waste Description: Two pieces of aluminum or magnesium shrapnel have been found at Shrapnel Site 2. Two pieces of iron or steel shrapnel have been found at Shrapnel Site 3. At the major shrapnel area, Shrapnel Site 1, it is reported that over 100 lbs (45 kg) of shrapnel has been found. Shrapnel consists of iron fragments and aluminum or magnesium fuze ring pieces.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
| Code: 600-78 | Classification: Accepted | Reclassification: Rejected (1/30/2003) |
| Names: 600-78; Power Pole 12-3 Cistern; 12-3 Cistern Catch Tank | Status: Inactive | Start Date: |
| Description: The cistern is approximately 1.5 meters (5 feet) in diameter by 2.4 meters (8 feet) deep. Debris was removed and it was filled with gravel. | Location: The site is located east-southeast of the 100F Area, on the opposite side of the Columbia River. It is near power pole 12-3, and close to the point where the electrical transmission lines change direction from northeast to north. (SW 1/4 of NW 1/4 Section 8, T 13N, R 28E) | Waste Type: Steam Condensate |
| Waste Description: The homestead cisterns were relatively free of debris, except for wood. The cistern was filled with approximately 10 yards (7.7 m) of pit-run gravel. Nearby debris has been removed. | Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity. |

| Code: 600-79 | Classification: Accepted | Reclassification: Rejected (1/30/2003) |
| Names: 600-79; Wahluke Slope Clay Pit Cistern Catch Tank | Status: Inactive | Start Date: |
| Description: The waste site has been evaluated and reclassified to Rejected. The clay pit cistern was a circular, concrete-lined pit approximately 1.7 meters (5 feet 6 inches) deep and 1.5 meters (5 feet) wide that has been backfilled with gravel. It is located near a pit that was used to obtain clay for lining irrigation canals. No obvious disposal pits remain from the homestead. | Location: Northeast of 100H area, on the opposite side of the Columbia River. It is north of Highway 24, south of the Wahluke Branch Canal, and east of the White Bluffs Wasteway. (SE 1/4 of NE 1/4 Section 27, T 15, R 27E) | Waste Type: Steam Condensate |
| Waste Description: The debris at this site included glass bottles, tin cans, asbestos pipe, and other garbage. | Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity. |

| Code: 600-80 | Classification: Accepted | Reclassification: Rejected (1/30/2003) |
| Names: 600-80; Wahluke Slope Cow Camp Cistern Catch Tank | Status: Inactive | Start Date: |
| Description: The waste site has been evaluated and reclassified to Rejected. The cistern was approximately 1.4 meters (4 feet 9 inches) in diameter and has been backfilled with gravel. A depth value was |
not estimated during original site investigation because the cistern was filled with debris at that time.

**Location:** Located northeast of the 100H Area, south of the Wahluke Branch Canal and north of Highway 24. (SE 1/4 of NE 1/4 of Section 26, T 15, R 27E)

**Waste Type:** Sanitary Sewage

**Waste Description:** The debris at this site included glass bottles, tin cans, and other garbage. Several of the empty bottles were from livestock antibiotic and pesticide for delousing cattle.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

**Code:** 600-81  
**Names:** 600-81; Wahluke Slope Homestead Cistern  
**Type:** Settling Tank  
**Status:** Inactive  
**Classification:** Accepted  
**Reclassification:** Rejected (1/30/2003)  
**Description:** The waste site has been evaluated and reclassified to Rejected. The site is a pre-Hanford cistern that measured approximately 1.52 to 1.83 meters (5 to 6 feet) in diameter. It has been backfilled with gravel.

**Location:** East-northeast of the 100F area, southeast of the area where the north-south electrical transmission line crosses the east--west electrical transmission line.

**Waste Type:** Sanitary Sewage

**Waste Description:** The debris at the bottom of the cistern appeared to be homestead-associated food containers.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

**Code:** 600-82  
**Names:** 600-82; Wahluke Slope Overlook Cistern  
**Type:** Catch Tank  
**Status:** Inactive  
**Classification:** Accepted  
**Reclassification:** Rejected (1/30/2003)  
**Start Date:**  
**End Date:**  
**Description:** The waste site has been evaluated and reclassified to Rejected. In 1990 there were two unfenced cisterns at this homestead location. One cistern measured 2.5 meters (8 feet) in diameter and 4.3 meters (14 feet) deep, and the other was 1 meter (3.5 feet) across by 1.2 meter.

**Location:** This site is on Wahluke Slope northeast of the Hanford townsite, southeast of 100F area, and near the bluffs overlooking the Columbia River.

**Waste Type:** Sanitary Sewage

**Waste Description:**

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

Hanford Site Waste Management Units Report
February 2015 2137
### Reevaluation Details:

**Names:** 600-85; Wahluke Slope Stove Cistern

**Reclassification:** Rejected (1/30/2003)

**Type:** Catch Tank  

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. This cistern is located on Wahluke Slope, east of 100-F Area, east-southeast of 100-H Area.

**Waste Type:** Sanitary Sewage

**Waste Description:**

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

**Code:** 600-86  

**Classification:** Accepted

**Names:** 600-86; Wahluke Slope Wasteway Cistern  

**Reclassification:** Rejected (1/30/2003)

**Type:** Catch Tank  

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. The cistern was approximately 2.4 meters (8 feet) in diameter by 0.9 meters (3 feet) deep. The walls were partially collapsed. In 1990, it was reported that the cistern was mostly destroyed and filled in. The cistern has been backfilled with gravel.

**Location:** The cistern is located on Wahluke Slope, northeast of 100H Area, near the Wahluke Branch Canal and the White Bluffs Wasteway. (SE 1/4 Section 22, T 15N, R 27E)

**Waste Type:** Sanitary Sewage

**Waste Description:** Debris at this site included glass bottles, tin cans, cable, concrete, and other garbage.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

**Code:** 600-87  

**Classification:** Accepted

**Names:** 600-87; Wahluke Slope Dune Homestead Dumping Area  

**Reclassification:** Rejected (1/30/2003)

**Type:** Dumping Area  

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. The homestead site contained buildings and a domestic trash disposal area.

**Location:** It is located on Wahluke Slope, east of 100F Area and northeast of the Hanford Townsite on the opposite side of the Columbia River. The homestead is near a series of sand dunes. (SW 1/3 of NE 1/4 Section 32, Y 14N, R 28E)

**Waste Type:** Sanitary Sewage
Waste Description: Debris consisted of domestic trash, parts of a barn or shed, parts of a flour mill, carriage pieces and a harness.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

Code: 600-88
Names: 600-88; Wahluke Slope Lonetree Homestead
Type: Dumping Area
Status: Inactive
Classification: Accepted
Reclassification: Rejected (1/30/2003)

Description: The waste site has been evaluated and reclassified to Rejected. The site contains a single live cherry tree, several dead trees and some small disposal areas. No above ground structures remain.

Location: The site is located on Wahluke Slope, east-northeast of the Hanford Townsite and southeast of the 100F Area, on the opposite side of the Columbia River. (SE 1/4 of NW 1/4 Section 20, T 13N, R 28E)

Waste Type: Sanitary Sewage
Waste Description: Debris consisted of metal cans and broken glass.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

Code: 600-89
Names: 600-89; Wahluke Slope Asphalt Batch Plant
Type: Dumping Area
Status: Inactive
Classification: Accepted
Reclassification: Rejected (1/30/2003)

Description: The waste site has been evaluated and reclassified to Rejected. The site is a graveled area about 0.8 hectares (2 acres) in size located on the Wahluke Slope. The site is north-northeast of the 100-D Area and south of Highway 24. It was apparently used as a temporary batch plant for mixing asphalt for paving operations. Two adjacent pits on site were empty. Another 4.6- by 4.6-meters (15- by 15-feet) area was used for disposal of concrete. The original users of the area are unknown.

Location: The site is located on Wahluke Slope, north-northeast of the 100-D Area and south of Highway 24. (NE 1/4 Section 4, T 14N, R 26E)

Waste Type: Sanitary Sewage
Waste Description: Debris from this site included asphalt, concrete, sheet metal, and other debris.

Closure Info: Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
### Code: 600-90

**Classification:** Accepted

**Classification:** Accepted

**Names:** 600-90; Wahluke Slope Coyote Bait Can/Bait Station

**Reclassification:** Rejected (1/30/2003)

**Type:** Dumping Area

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. This unit is composed of two separate sites, both on Wahluke Slope. The Coyote Bait Can was located southeast of 100F area and northeast of the Hanford Townsite. A large military ammunition box was partially buried at this site. The lid of the box was marked "BAIT CAN." Evidence in the area suggested that it was once used to store bait for coyote trapping. The Coyote Bait Station was east of the bait can, near the eastern edge of the wildlife area. At this location, over 50 coyote skulls were counted. Large animal bones in the area indicated that a poisoned carcass was most often used for bait. Historical records report that trappers would poison horse carcasses to attract and kill the coyotes for their pelts. Bones at this location were old and may predate government control of the land.

**Location:** The sites are located southeast of 100-F Area on the opposite side of the Columbia River on Wahluke Slope. (SW 1/4 Section 18, T 13N, R 28E and NE 1/4 Section 17, T 13N, R 28E)

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

### Code: 600-91

**Classification:** Accepted

**Classification:** Accepted

**Names:** 600-91; Pit 47; Wahluke Slope Gravel Pit #47

**Reclassification:** Rejected (1/30/2003)

**Type:** Depression/Pit (nonspecific)

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. The site is made up of two gravel pits. The smaller pit had been used as a disposal area.

**Location:** The site is located on Wahluke Slope, northeast of 100B Area, 1/4 mile south of Highway 24 at mile marker 47.

**Waste Type:** Sanitary Sewage

**Waste Description:** The debris at this site included building materials, glass bottles, tin cans, paint cans, cable, concrete, oil cans, and other garbage in the far pit. There was a significant amount of oil contaminated soil.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

---

### Code: 600-92

**Classification:** Accepted

**Classification:** Accepted

**Names:** 600-92; Borrow Pit #56; Pit 56; Wahluke Slope Gravel Pit #56

**Reclassification:** Rejected (1/30/2003)

**Type:** Depression/Pit (nonspecific)

**Status:** Inactive

**Description:** The waste site has been evaluated and reclassified to Rejected. The site is made up of two gravel pits. The smaller pit had been used as a disposal area.

**Location:** The site is located on Wahluke Slope, northeast of 100B Area, 1/4 mile south of Highway 24 at mile marker 47.

**Waste Type:** Sanitary Sewage

**Waste Description:** The debris at this site included building materials, glass bottles, tin cans, paint cans, cable, concrete, oil cans, and other garbage in the far pit. There was a significant amount of oil contaminated soil.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.
The waste site has been evaluated and reclassified to Rejected. The site consists of several soil borrow pits.

The site is located on Wahluke Slope, north-northwest of 100D Area and north of Highway 24.

Sanitary Sewage

Debris included communications wire, timbers, bottles, cans, barbed wire fencing, and fence posts. Potentially hazardous items identified included one 19 liter (5-gallon) can full of dead beetles (possible herbicide/insecticide) and two 19 liter (5-gallon) oil cans with liquid.

Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

The waste site has been evaluated and reclassified to Rejected. The range was used by the original Hanford Site security force for target practice. A bench has been cut out of the bluff measuring approximately 100 yards long. Some 55 gallon drums were placed at the base of the bluff along the bench to serve as targets. Numerous spent bullets have been found in the target area. A burial trench located west of the firing range contained empty metal ammunition boxes.

The site is located across the Columbia River from the Hanford Townsite. (N 1/2 Section 30, T 13N, R28E)

Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

The waste site has been evaluated and reclassified to Rejected. This site is an old schoolhouse located on the Wahluke Slope. Only the concrete front steps remain to this old schoolhouse. The school structure has been removed. The steps were apparently preserved because a USGS survey marker is imbedded in the top step. This site is not at the townsite of Wahluke.

Located north of the 100B Area, near the north shore of the Columbia River.

Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

**Description:** The waste site has been evaluated and reclassified to Rejected. The site consisted of two separate areas, both of which were littered with old lumber and lesser amounts of glass and metallic debris. In 1990, it was reported that the site contained the remains of three or four wood frame structures, with roofing material, window screen, railroad ties, structural lumber, personal items such as toothbrushes and razors, and military oil cans. The debris has been removed.

**Location:** The unit is at the top of the hill north of Vernita Bridge, northwest of 100-B/C Area.

**Related Sites/Structures:** PSN-72/82

**Waste Type:** Water

**Waste Description:** Debris at this site included building materials, wood, glass, wire mesh, and paper products. Trash includes items that appear to be of military origin such as toothbrushes, razors, bottles, cans and military oil cans.

**Closure Info:** Thirty five sites on the Wahluke Slope were grouped onto one Reclassification form in 2003 and their status was changed to Rejected. They were cleaned up by DOE as part of a landlord activity, not a CERCLA activity.

**Description:** The site is sandy and mostly unvegetated. The site has been scraped for material to cover the adjacent burial ground. No waste was observed in the area in 1995, except for a large pile of tumbleweeds that were removed from the fence surrounding the 618-10 Burial Ground.

**Location:** The site is located west of Route 4 South between milepost 17 and 18. It is adjacent to the southwest corner of the 618-10 Burial Ground.

**Related Sites/Structures:** The 618-10 Burial Ground is associated with the unit.

**Waste Type:** Steam Condensate

**Waste Description:** A large pile of tumbleweeds was observed.

**Description:** The site is located in a slight depression where 0.3 to 0.6 meters (1 to 2 feet) of soil has been removed to cover the 618-11 Burial Ground.
The site is located approximately 1,500 meters (4,920 feet) west, northwest of Washington Public Power Supply System Plant Number 2 and just north of the 618-11 Burial Ground.

Code: 600-118  
Names: 600-118; Contaminated Soil Northwest of Gable Mountain Pond; Hot Spot Northwest of Gable Mountain Pond  
Type: Ditch  
Status: Inactive  
Description: This overflow site has been consolidated with its source, the 216-A-25 Gable Mountain Pond. The stabilized site begins northwest of 216-A-25 Pond, and was formerly an overflow trench from 216-A-25 (Gable Mountain Pond) that ran north-south, approximately 0.9 meters (6 feet) deep. The site extends north, under the power lines where the site widens. The trench deepened again north of the power lines, so the site is narrower there, and fades out in a wider, but shallower area at the north end. The area outside the stabilized area is vegetated with sagebrush and cheatgrass. The stabilized area is sparsely vegetated with cheatgrass, crested wheatgrass, and Sandberg's bluegrass. The area is posted as an "Underground Radioactive Material" area.

Location: The site is located adjacent to (north side) the 216-A-25 (Gable Mountain Pond) stabilized overflow area.

Related Sites/Structures: This site is an overflow area from 216-A-25 (Gable Mountain Pond), as evidenced by aerial radiation surveys and topographic relief maps showing a naturally downward flow direction toward this overflow area for water in Gable Mountain Pond.

Waste Type: Stormwater Runoff  
Waste Description: The waste site was identified in the 1996 Flyover Survey and reported on April 11, 1996.

This Site Was Consolidated With:  
Code: 216-A-25  
Names: 216-A-25; 216-A-25 Swamp; Gable Mountain Pond; Gable Mountain Swamp; Gable Pond

Code: 600-121  
Names: 600-121; Coal Ash Piles; White Bluffs Coal Ash Piles  
Type: Dumping Area  
Status: Inactive  
Description: The site is several small coal ash piles located just east of the Pickling Acid Cribs.

Location: The site is located south of Federal Avenue and west of Route 2 North. The site is just east of the White Bluffs Pickling Acid Cribs (600-106).

Waste Type: Stormwater Runoff  
Waste Description: The waste is coal ash that has been placed in piles (discernible units).

<td>Dumping Area</td>
<td>Inactive</td>
<td>The site was a farm site. One source indicates that it may have been occupied by the army for a period of time indicates the site is littered with waste debris, including battery cores, broken glass, concrete, cans, bottles, wire, machinery parts, and other domestic wastes (Carpenter, 1994). A site visit done on August 16, 1996 did not find any battery cores or evidence of military debris. Two of the building foundations are deep and open to the surface. One of these is filled with concrete rubble, piping and debris. There is one concrete slab that could be a building foundation and one small concrete structure that is approximately 1.2 meters (4 feet) by 0.9 meters (3 feet) and is approximately 0.9 meters (3 feet deep).</td>

meters (2133 feet) southwest of the intersection of Federal Avenue and Route 2 North.

**Related Sites/Structures:** 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system.

**Waste Type:** Chemicals

**Waste Description:** Concrete

---

**Code:** 600-130  
**Classification:** Not Accepted

**Names:** 600-130; American Pipe Company Facilities; Stephensen's Cement Pipe Factory Fabrication Shop

**Type:** Fabrication Shop

**Status:** Inactive

**Description:** The site consists of remnants of the following facilities: valve box and 2 inch water line, concrete foundation, warehouse foundation, concrete sump attached to warehouse foundation, debris pile, foundation, potential smokestack base, and small subsidences that appear to be rotted wooden poles. The area is littered with wood, metal parts, glass, burned building materials, and debris.

**Location:** The site is located northeast of Route 2 North, northwest of Federal Avenue, and northwest of the White Bluffs townsite. It is approximately 700 meters (2297 feet) north/northwest of the intersection of Route 2 North and Federal Avenue.

**Waste Type:** Water

**Waste Description:** The waste is miscellaneous trash and debris consisting of wood, metal parts, glass, burned building materials, and debris.

---

**Code:** 600-135  
**Classification:** Accepted

**Names:** 600-135; Horseshoe Pit; Spare Parts Machine Shop Landfill; White Bluffs Spare Parts Machine Shop Landfill and Pit

**Type:** Burial Ground

**Status:** Inactive

**Description:** This unit includes two potential waste sites. One site is called the Spare Parts Machine Shop Landfill, also known as the horseshoe pit. It was once a borrow pit that was later used as a waste disposal site. The borrow pit was dug in a semicircle to the northeast of nearby warehouses (hence the name horseshoe pit). The site appears to have been backfilled over about one-half to two-thirds of its area. The second site is a pit oriented in the east-west direction located directly west of Spare Parts Machine Shop Landfill. This pit measures about 90 meters (300 feet) long by 40 meters (130 feet) wide. No documentation could be found to indicate the purpose of the pit.

**Location:** The site is located northeast of Route 2 North, northwest of Federal Avenue and southwest of the export water line road. The site is approximately 700 meters (2297 feet) northeast of the intersection of Route 2 North and Federal Avenue and almost due west of the intersection of Federal Avenue and the export water line road.
### Related Sites/Structures:

A DuPont drawing indicates that the southwest corner of the site was the location of the MS-9 Warehouses. The same drawing indicates a well in the vicinity of the warehouses.

### Waste Type:

Sanitary Sewage

### Waste Description:

Equipment parts and pieces are scattered about the area.

### Waste Type:

Sanitary Sewage

### Waste Description:

The entire area was covered with scattered transite siding.

### Code: 600-136

### Names:

600-136; Insulation Warehouses; White Bluffs Insulation Warehouses

### Type: Storage

### Status: Inactive

### Start Date: 

### End Date: 

### Description:

The site is a warehouse area within the White Bluffs townsite. It is covered with cheatgrass with some rabbitbrush and tumbleweed growth. There is very little evidence of the former warehouse buildings except for a few pieces of wood. Pavement from the former Lincoln St. shown in the referenced documents is still visible south of the site and aided identifying the precise location in the field. There was no evidence of asbestos at the site.

### Location:

The site is located within the old townsite of White Bluffs, north of Federal Avenue and west of Route 2 North. It is approximately 160 meters (525 feet) northwest of the intersection of Route 2 North and Federal Avenue. Source documents show it's location on the north corner of the former Lincoln Street and Railroad Avenue, which remain visible.

### Process Description:

This warehouse was used for insulation materials.

### Names:

600-138; Fumigation Chamber Building; White Bluffs Fumigation Building

### Type: Maintenance Shop

### Status: Inactive

### Start Date: 

### End Date: 

### Description:

The site is the remains of a fumigation building. A field investigation was performed by T. F. Johnson on October 15, 1996. The terrain was flat with gravel surface soil and had cheatgrass and rabbitbrush vegetation. Very little evidence of the fumigation building remained at the site. A few pieces of wood and concrete were observed in the area. A standing wooden post remained near the site which may have been part of the fence surrounding the building.

### Location:

The site is located approximately 220 meters (722) west of the intersection of Route 2 North and Federal Avenue and approximately 150 meters (492 feet) northwest of the corner of Commercial Avenue and Federal Avenue. The building was located about 37 meters (120 feet) northeast of Commercial Avenue.

### Process Description:

The building was used primarily to fumigate bedding materials.

Code: 600-147  
Classification: Not Accepted  
Reclassification: None  

Names: 600-147; Wood Shack (Northwest of Gable Mountain)  

Type: Office  
Status: Inactive  

Description: The site is an old, very weathered, one-room wooden shack with a gable roof, one door, one window per side, and central heater, mounted on two wooden skids. It has at least 12 wells within 50 meters (160 feet), and is probably a well driller's shed, used to shelter the crews and hold equipment when the nearby wells were installed.

Location: The site is located on the north side of Gable Mountain and just north of the dirt road that runs east west along the north side of Gable Mountain. However, the shed is not visible from the road, because of a small rise between the road and shed. The site is best accessed by turning east just north of milepost 2 on Route 4 North. Continue east on the paved road until the road begins to turn up the mountain. At this point, continue straight ahead on the dirt road which continues east along the mountain. The site is located approximately 2.1 miles east from Route 4 North and east of the high voltage power lines that cross the dirt road. Follow a rough road leading north from the east-west road.

Waste Type: Sanitary Sewage

Code: 600-148  
Classification: Accepted  
Reclassification: None  

Names: 600-148; Environmental Restoration Disposal Facility; ERDF  

Type: Landfill (Lined)  
Status: Active  

Description: Designed to be expanded as needed, ERDF comprises a series or cells or disposal areas. Each pair of cells is 70 feet deep, and 500 feet by 1,000 feet at the base, large enough to hold about 2.8 million tons of material. The fourth and largest expansion of ERDF was completed in January 2011. Two "super cells," each the equivalent of a pair of existing cells, were constructed using Recovery Act funds. Additional upgrades included new maintenance facilities, additional dump ramps and additional transfer areas for waste containers, all of which will enhance the safety of increased, daily operations.

With the addition of super cells 9 and 10, ERDF capacity is 16.4 million tons. At the 70-foot-base, ERDF covers the same areas as 52 football fields. To date (2011), nearly 11 million tons of contaminated material has been disposed in the facility. One of the key components of ERDF is the liner that is built into each cell. The liner consists of multiple layers of plastic and other impermeable materials and a system to collect and removed liquids as they drain through the waste materials. ERDF does not accept liquid waste for disposal, but water enters the facility when it rains and snows, and water also is used for dust control during routine operations. The collected water, or leachate, is collected and routed to an onsite treatment facility. After treatment, the liquid is clean enough to be returned to the ground with no harm to the environment.

Location: The Environmental Restoration Disposal Facility (ERDF) is located southeast of the 200 West Area and southwest of the 200 East Area.
### Related Sites/Structures:
Leachate collected at the landfill will be managed at the 200 Area Effluent Treatment Facility, located in the 200 East Area, or other approved facility.

### Process Description:
Built in 1996, ERDF accepts low-level radioactive, hazardous, and mixed wastes that are generated during the cleanup activities at the Site. It does not accept any non-Hanford waste. After each load is placed into ERDF, it is compacted. Earth movers equipped with high-tech ground monitoring equipment drive over the waste to eliminate any air pockets or gaps in the landfill. Hollow tubes or pipes are either filled with a cement material or are cut into pieces. This ensures there are no void spaces in the facility, which could result in the landfill sagging or settling, which could cause damage to the permanent cap that ultimately will cover the entire facility when it is no longer needed. In the meantime, a temporary cap is placed over cells as they are filled.

### Waste Type: Sanitary Sewage
**Waste Description:** The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) and is expected to consist of approximately 15% to 20% burial ground waste.

### Waste Type: Sanitary Sewage
**Waste Description:** The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) and is expected to consist of approximately 65% to 75% contaminated soil and demolition debris.

### Waste Type: Sanitary Sewage
**Waste Description:** The total volume of waste is expected to be less than 2.14E+07 cubic meters (2.8E+07 cubic yards) is expected to consist of approximately 10% to 15% wastewater pipelines, ancillary equipment, and associated soil contamination.

</table>
Status: Inactive

Description: The site is the remaining parts from an old windmill. The windmill was constructed of sheet metal and steel. An abandoned well was observed approximately 90 meters (295 feet) southwest of the windmill.

Location: The site is located due north of 100-D Area and approximately 50 meters (165 feet) north of the left bank (facing downstream) of the Columbia River. On the USGS Map Coyote Rapids Quadrangle 7.5 minute series, the site is located about 200 meters (656 feet) east of the intersection labeled "Wahluke". If driving to the site, take the only paved road from highway SR24 to the river.

Waste Type: Sanitary Sewage

Waste Description: The waste is parts from an old windmill which was constructed of sheet metal and steel.

---

Code: 600-155

Classification: Not Accepted

Names: 600-155; Dumping Area Upstream of River Mile Marker 35 Identified During RCRA General Inspection #HIRIV-FY96 Item #7

Reclassification: None

Type: Dumping Area

Start Date: 

End Date: 

Status: Inactive

Description: The site consists of an old rusty machine part with approximate dimensions of 1.8 meters by 1.2 meters by 0.6 meters (6 feet x 4 feet x 2 feet). The part is marked with a small metal tag "USA-HEW 355464/ Property of US Government." The surrounding soil is silty sand and cobbles, with moderate cheatgrass and bunched vegetation. Nearby flood debris consists of tree branches and small logs. There are no other large pieces of metal or construction type material. The surface of the access road is sand and gravel.

During visits to the site on February 1, 1999, and February 3, 1999, other debris was observed. This debris included a chunk of concrete, an old muffler, a piece of metal that looked as though it could have come from the piece of machinery, other metal debris, a tire and wood debris (not flood debris). This miscellaneous debris is primarily south of the piece of machinery and most is within 100 meters (328.1 feet). A field visit on July 19, 1999, verified that the large piece of equipment had been removed. A small piece of metal (approximately 0.46 meters (18 inches) in length) remained half buried in the soil.

Location: The site is approximately 250 meters (810 feet) upstream from mile marker 35 and approximately 80 meters (260 feet) from the river shoreline. The site is visible from the road.

Related Sites/Structures: The origin of this piece of equipment is unknown.

Process Description: The purpose of this piece of equipment is unknown.

Waste Type: Sanitary Sewage

Waste Description: The waste is steel scrap. The metal tag contains "USA-HEW-355464". "HEW" stands for Hanford Engineering Works which was the name used during the era of reactor construction. Therefore, the material is not pre-Hanford historic waste.

*Hanford Site Waste Management Units Report*
February 2015
### Lead Dumping Area

**Type:** Dumping Area  
**Status:** Inactive  
**Description:** There had been two debris remnants, one consisting of two 8 inch steel pipe sections embedded in concrete and the second is a bucket of what appeared to be lead. The bucket of lead was removed in 1995.

**Location:** The site is located west of Route 2 North and south of Federal Avenue. It is 900 meters (2953 feet) south of the intersection of Route 2 North and Federal Avenue on the west side of a powerline road.

**Waste Type:** Chemicals  
**Waste Description:** The remaining waste is two 8 inch sections of pipe encased in concrete.

</tbody>
</table>

### Valve Box

**Type:** Valve Pit  
**Status:** Inactive  
**Description:** The site is a subsidence of about one square meter and is lined with concrete, suggesting a valve box or drain system. The subsidence indicates a subsurface structure with a void space that...
allows overburden to subside into it because of storm runoff. There is a section of power pole laying across the top of the structure.

**Location:** The site is located west of Commercial Avenue and northwest of the intersection of Commercial Avenue and Federal Avenue.

**Related Sites/Structures:** 600-126, 600-166, 600-165 and 600-170 all appear to be part of a related underground piping system.

</tbody>
</table>
highway (Route 2 North). The site contains a number of toilet pits (outhouse pits) that remain open. The toilet pits were described as being located between the house foundation and the road to the south. The ground in this area is very uneven and has a rolling surface. During the June 1999 visit, it was observed that much of the southern end of the orchard east of the house foundation has the same undulating ground surface. Several hazards are found near this site, including the house foundation, a wood-lined pit on the north side of the foundation, and the former well or pump house near the south side of the site.

**Location:**

The site is located north of the Hanford townsite and west of Route 2 North. The site is accessed by a dirt road that exits Route 2 North approximately 4.7 kilometers (2.9 miles) north of the intersection of Route 2 and Route 11. It is located north of an east-west dirt road; the travel distance from Route 2 North is approximately 1100 meters (3609 feet, 0.68 miles).

End Date:

Description: The site is the White Bluffs Townsite located in the proximity of the intersection of Route 2 North and Federal Avenue. Most of the buildings have been demolished except for the White Bluffs Bank.

Location: The site is located west of 100F and south of 100H, around the intersection of Route 2 North and Federal Avenue. The site is predominantly east of Route 2 North.

Related Sites/Structures: See subsite for individual facility descriptions within the Townsite. Three sites, the booster pump station and the ground storage tank (located next to each other at the northeast corner of Fifth Avenue and Federal Avenue), and the sewer junction box (located about 70 meters due north of the Route 2 North and Federal Avenue intersection), are addressed separately (See Sitecode 600-158 and 600-184).

This Site has the Following SubSites:

Type: Injection/Reverse Well
Status: Inactive

Classification: Not Accepted
Reclassification: None
Start Date: 
End Date: 

Description: The subsite is multiple wells in the White Bluffs Townsite area. One well appears to have a sampling well constructed within the remains of the older well. The new well is labeled 699-81-38, A5337, and appears to be in use. The third well appears to have been decommissioned. It has been filled with grout and is marked with a metal disk that reads "Well No. 699-83-36, Abandoned 9-21-95."
**Location:** The first well is located north of Federal Avenue and west of Third Avenue. The second well was located almost due south of the intersection of Federal Avenue and Railroad Avenue, and north of Commercial Avenue. A third well was located at the northeast end of Federal Avenue. A fourth well was located near the north end of Fifth Avenue by Building 20, MS-9 Warehouse.

**Process Description:** While the site type for these wells is listed as "Injection/Reverse Well," they appear to have been constructed as water wells to service the White Bluffs townsite (C-3316).

**Description:** All these warehouses were removed decades ago. There were six warehouses. Three of the warehouses were located on the south side of Federal Avenue between First and Second Avenues. Another one was located on the northeast corner of First Avenue and Federal Avenue. One of the warehouses was located on the west side of First Avenue, halfway between Federal Avenue and Lincoln Avenue. The sixth was located at the northeast corner of First Avenue and Lincoln Avenue.

**Process Description:** Plot map C-3316 indicates the warehouses were used for storing office equipment.

Type: French Drain
Status: Inactive

Description: The site is either a french drain or dry well that is a 61 centimeter concrete pipe, that has a steel lid, and appears to be about 1 meter deep. The sides are perforated, indicating that its purpose may have been for storm runoff or steam condensate. There does not appear to be an inlet pipe inside the structure.

Location: The site is on the north side of Federal Avenue and west of Commercial Avenue. It is approximately 470 meters (1542 feet) southwest of the intersection of Commercial and Federal and approximately 650 meters (2133 feet) southwest of the intersection of Federal and Route 2 North.

Waste Type: Sanitary Sewage
Waste Description: Possibly, the waste was steam condensate.

Code: 600-173
Names: 600-173; White Bluffs Domestic Debris Dump and Building Foundations

Type: Dumping Area
Status: Inactive

Description: The site is a domestic type waste dump and pre-Manhattan Engineering District building foundations. The waste dump consists of miscellaneous debris and the building foundations appear to be pre-Manhattan Engineering District. One building appears to have been a garage or farm shop because of the way that the concrete was formed.

Location: The site is located southwest of the intersection of Route 2 North and Federal Avenue. The site is east of the White Bluffs Large Fenced Depression.

Waste Type: Sanitary Sewage
Waste Description: The waste consists of miscellaneous debris including domestic bottles, glassware, paint cans, cans, containers of heavy industrial nuts and bolts (greater than 2.5 cm in diameter). Two building foundations are also included as a part of the site.
Description: The site is a 61 centimeter vitrified clay pipe french drain. The top is flush with the surface and it is filled with rocks.

Location: The site is located approximately 530 meters (1739 feet) northwest of the intersection of Route 2 North and Federal Avenue.

Waste Type: Equipment

Waste Description: The french drain may have been used to dispose of steam condensate.

---

Description: The site is three large depressions thought to be the original drain field for waste water generated at the ice house. The site was originally marked by a steel post and wooden rail fence that can still be found around much of the site.

Location: The site is located in the White Bluffs Area, south of the intersection of Route 2 North and Federal Avenue and northeast of the White Bluffs Pickling Acid Cribs (600-106).

Waste Type: Equipment

Waste Description: The waste was waste water. It is unknown if other wastes were disposed of at the site or if the site was used for other purposes.

---

Description: The site consists of two areas that are within close proximity. The pipe bender is a large heavy-walled pipe, placed vertically in the ground with approximately 1.2 meters (4 feet) of the pipe extending above grade. Several holes of varied sizes have been drilled into the vertical pipe. The holes are the approximate size of varied small diameter pipes. The structure is assumed to have been used to do rough bending of pipe. Adjacent to the pipe bender is a large area of debris that appears to have been a miscellaneous equipment dumping/storage area. Random dumping of small quantities of oils also occurred in the area.

Location: The site is located west of Route 2 North and south of Federal Avenue. It is approximately 810 meters southeast of the intersection of Route 2 North and Federal Avenue and just west of a powerline road.

Waste Type: Chemicals

Waste Description: The site shows evidence of random oil dumping.
## Priest Rapids Ice House Burial Ground

<table>
<thead>
<tr>
<th>Code: 600-179</th>
<th>Classification: Accepted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Names: 600-179; Priest Rapids Ice House</td>
<td>Reclassification: Rejected (10/6/1997)</td>
</tr>
<tr>
<td>Type: Burial Ground</td>
<td>Start Date: 1/1/1943</td>
</tr>
<tr>
<td>Status: Inactive</td>
<td>End Date:</td>
</tr>
</tbody>
</table>

### Description:
The site is the remains of the Priest Rapids Ice House that was demolished in situ in 1975.

### Location:
The site is located west of Route 2 North, south of Federal Avenue, between Commercial Avenue and the railroad. It is approximately 260 meters (853 feet) south/southeast of the intersection of Route 2 North and Federal Avenue.

### Waste Type: Chemicals

### Waste Description:
The waste consists of the demolished facility buried in place in 1975. Occasionally small pieces of wood and clay can be observed on the surface.

## White Bluffs Suspect Automotive Repair Shop

<table>
<thead>
<tr>
<th>Code: 600-180</th>
<th>Classification: Accepted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Names: 600-180; White Bluffs Suspect Automotive Repair Shop</td>
<td>Reclassification: Rejected (10/6/1997)</td>
</tr>
<tr>
<td>Type: Maintenance Shop</td>
<td>Start Date:</td>
</tr>
<tr>
<td>Status: Inactive</td>
<td>End Date:</td>
</tr>
</tbody>
</table>

### Description:
The site is described as the remains of what appears to have been an automotive repair shop.

### Location:
The site is located west of Route 2 North and south of Federal Avenue. It is northeast of the White Bluffs Pickling Acid Cribs (600-106).

### Waste Type: Chemicals

### Waste Description:
The waste may have been solvents, grease, antifreeze, oils, gasoline. Concern was expressed by the Environmental Protection Agency (EPA) because of the types of materials usually found at an automotive repair shop. However, there is no evidence of this type of disposal. (Per Discovery Site Evaluation Checklist completed by Steve Weiss 8/6/96). Remaining surface material consists of jack stands, car parts, wooden debris, and other metallic debris. During the May 1999 visit, the following were observed: light fixtures, paint cans, a muffler, lumber, sections of what appears to be stove pipe, a 55 gallon drum marked "Property of Shell Oil," and buckets containing what appeared to be tar. The site's remains didn't suggest an automotive repair shop as much as a supply hut.

---

## White Bluffs Burn Pile and Debris Dumping Area

<table>
<thead>
<tr>
<th>Code: 600-183</th>
<th>Classification: Accepted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Names: 600-183; White Bluffs Burn Pile and Debris</td>

</tr>
<tr>
<td>Type: Dumping Area</td>
<td>Start Date:</td>
</tr>
<tr>
<td>Status: Inactive</td>
<td>End Date:</td>
</tr>
</tbody>
</table>

### Description:
The site is a burn pile and debris dumping area. Within the site is one area consisting of a burn pile of domestic type debris. The other area consists of 5 gallon military type drums.

### Location:
The site is located west of Route 2 North and south of Federal Avenue. It is approximately 680 meters (2231 feet) south of the intersection of Route 2 North and Federal Avenue.
Waste Type: Chemicals
Waste Description: The waste consists of miscellaneous debris, including domestic type debris and military drums. It is unknown if any hazardous materials remain.

Code: 600-184
Names: 600-184; White Bluffs Townsite Septic System
Type: Septic Tank
Status: Inactive
Description: The site is a concrete box with a metal lid. It is about 0.61 meters deep (2 feet) and is dry inside.
Location: The sewer junction box is located about 30 meters due north of the intersection of Route 2 North and Federal Avenue. The site is about 50 meters east of Route 2 North and 50 meters north of Federal Avenue.
Process Description: The site is the various components of a septic system serving the central area of the White Bluffs Townsite. In the rehabilitation of existing buildings containing inside toilets and plumbing facilities, whenever possible, connections were made to permanent systems (DuPont, 1945). The White Bluffs Townsite had one septic tank and 300 feet of sewer line. During field surveillance activities, a sewer junction box consisting of a shallow concrete box with a heavy steel cover was located within the confines of the city.

Waste Type: Chemicals
Waste Description: The unit received portable toilet cleaning chemicals and human waste.

Code: 600-185
Names: 600-185; Hanford Construction Camp Honey Dump Site
Type: Trench
Status: Inactive
Description: The site is described as a dumping and cleaning station for the portable toilets used at the various Hanford construction sites.
Location: The site is located southeast of the Hanford Construction Camp, 280 meters (919 feet) east/southeast of the intersection of Avenue A and 9th Street. It is south of the southernmost sewage treatment plant (600-186).

Waste Type: Chemicals
Waste Description: The unit received portable toilet cleaning chemicals and human waste.

Code: 600-189
Names: 600-189; White Bluffs Warehouse Facility French Drains; 100-H-23
Type: French Drain
Status: Inactive
Description: The site is a concrete box with a metal lid. It is about 0.61 meters deep (2 feet) and is dry inside.
Location: The sewer junction box is located about 30 meters due north of the intersection of Route 2 North and Federal Avenue. The site is about 50 meters east of Route 2 North and 50 meters north of Federal Avenue.
Process Description: The site is the various components of a septic system serving the central area of the White Bluffs Townsite. In the rehabilitation of existing buildings containing inside toilets and plumbing facilities, whenever possible, connections were made to permanent systems (DuPont, 1945). The White Bluffs Townsite had one septic tank and 300 feet of sewer line. During field surveillance activities, a sewer junction box consisting of a shallow concrete box with a heavy steel cover was located within the confines of the city.

Waste Type: Chemicals
Waste Description: The waste is sanitary sewage (if the septic tank and/or drainfield could be located).
Rev. 24
DOE/RL-88-30

**Status:** Inactive

**Description:** The site is three French drains associated with a large warehouse and temporary construction facility. The area near the French drains is littered with debris and patches of gravel. There is no oil-stained soil or other indication of hazardous waste disposal at or near the French drains.

**Location:** The site is located approximately 1100 meters (3609 feet) northwest of the intersection of Route 2 North and Federal Avenue in a large warehouse-temporary construction facility area.

**Release Description:** The use of the drains was not reported. Drains were constructed for disposal of liquid wastes and may have been used for wastewater and/or stormwater.

**Process Description:** No documentation has been found describing the purpose of the drains. French drains were used for disposal of liquid wastes and these may have been used for wastewater and/or stormwater.

**Waste Type:** Chemicals

**Waste Description:** Transite siding was scattered throughout the area.

**Waste Type:** Chemicals

**Waste Description:** The waste may have been wastewater/stormwater.

---

**Status:** Inactive

**Description:** The site is the remains of a fumigation building. During a field investigation by T. F. Johnson on October 24, 1996, there was no evidence of the fumigation chamber at the site except for a few small pieces of concrete. The area was covered with cheatgrass, rabbitbrush, and tumbleweeds. The fumigation chamber (disinfestation building) was a small wooden frame building. It was posted with "Poison Gas, Keep Out" signs and protected by an 2.4 meter (8 foot) barbed-wire security fence.

**Location:** The site is located between Avenue A and the Columbia River, between the two northernmost sewage treatment plants (600-186). The site may be approached from the north by taking a road southeast from Route 2 North between mileposts 1 and 2. Continue southeast on this road, which parallels the river, for 3.5 kilometers (2.2 miles). A group of trees is located just above the riverbank and north of the site. The site is located approximately 140 meters (459 feet) northeast of the intersection formerly known as Avenue A and 5th Street.

**Process Description:** A small building adjacent to the fumigation chamber is referred to as the "bedding storage" building, suggesting that the fumigation chamber was used to fumigate bedding.

---

**Status:** Inactive

The site is located approximately 140 meters (459 feet) northeast of the intersection formerly known as Avenue A and 5th Street.

**Process Description:** A small building adjacent to the fumigation chamber is referred to as the "bedding storage" building, suggesting that the fumigation chamber was used to fumigate bedding.

---

**Status:** Inactive

**Description:** The site is the remains of a fumigation building. During a field investigation by T. F. Johnson on October 24, 1996, there was no evidence of the fumigation chamber at the site except for a few small pieces of concrete. The area was covered with cheatgrass, rabbitbrush, and tumbleweeds. The fumigation chamber (disinfestation building) was a small wooden frame building. It was posted with "Poison Gas, Keep Out" signs and protected by an 2.4 meter (8 foot) barbed-wire security fence.

**Location:** The site is located between Avenue A and the Columbia River, between the two northernmost sewage treatment plants (600-186). The site may be approached from the north by taking a road southeast from Route 2 North between mileposts 1 and 2. Continue southeast on this road, which parallels the river, for 3.5 kilometers (2.2 miles). A group of trees is located just above the riverbank and north of the site. The site is located approximately 140 meters (459 feet) northeast of the intersection formerly known as Avenue A and 5th Street.

**Process Description:** A small building adjacent to the fumigation chamber is referred to as the "bedding storage" building, suggesting that the fumigation chamber was used to fumigate bedding.

**Process Description:** A small building adjacent to the fumigation chamber is referred to as the "bedding storage" building, suggesting that the fumigation chamber was used to fumigate bedding.
Description: The site is located in a shallow depression with heavy tumbleweed and cheatgrass growth. Prior to November 1997, the depression had been marked with a steel post and chain barrier and posted with two "DANGER KEEP AWAY" signs. The posts and chains were removed on November 19, 1997.

Location: The site is located east of Federal Avenue, south and west of Route 2 North, between the railroad tracks and the old road which was "Railroad Avenue."

Process Description: The site is the location of the White Bluffs Gas Station, that was demolished in 1975 as part of a sitewide clean up project. No documentation can be found to determine if any underground storage tanks were removed. A depressed area, that measured 4.88 X 7.62 meters (16 X 25 feet), was identified in 1989 and surrounded with steel posts and chain. Federal Avenue is located just north of the site of the depression. The west side of the site is bounded by railroad tracks and the east side is bounded by an old road believed to be "Railroad Avenue." The soil in the area is soft and sandy. The existence of the underground storage tanks could not be determined from the initial (1996) field investigation. In addition, it is possible that the tanks, if present, may have been located north of Federal Avenue and east of Railroad Avenue.

Code: 600-194 Classification: Accepted
Names: 600-194; Main Pipe Fabrication and Blacksmith Shop; White Bluffs Main Pipe Fabrication Shop Reclassification: Rejected (10/6/1997)
Type: Fabrication Shop Start Date:
Status: Inactive End Date:
Description: The site is the remnants of pipe fabrication shop. The building footprint can be discerned by observing the disturbed ground surface and the lack of rabbitbrush as compared to the surrounding terrain. In some areas near the western portion of the site, the concrete floor is visible. The floor appears to be intact, but much of it is covered by soil. Waste materials observed at the site include wood, coal, metal, metal lathe turnings, pipe, nails, brick, and concrete.

Location: The site is located approximately 60 meters (197 feet) southeast of Federal Avenue and about 230 meters (755 feet) southwest of Route 2 North. The site is just west of the old road once known as "Commercial Avenue" and between Federal Avenue and the BPA Powerlines.

Related Sites/Structures: Liquid wastes from the Main Pipe Fabrication Shop were disposed to the Pickling AcidCribs.

Process Description: The Main Pipe Fabrication Shop was used to prepare piping systems for the reactor areas. The pipe was prepared for welding by grinding, etching with acid (pickling), and then cleaning with solvent materials. This shop was the source of waste discharged to the White Bluffs Pickling Acid Cribs (600-106).

Waste Type: Chemicals
Waste Description: The site contains concrete, brick, wood, coal, metal, and small amounts of glass. The Main Pipe Fabrication And Blacksmith Shop used acids and solvents in the pipe fabrication process which may have contaminated the waste materials and soil remaining at the site. Carbon tetrachloride was a common degreasing agent at the time and may be present in the debris.

Description: The White Bluffs Technical Baseline Report states the site is two french drains and what appears to be a valve box. No additional information is known. A RARA Walkdown visit done in May 1999. They found a round clay french drain filled with rock and an additional small subsidence near the valve box. They also noticed a long narrow area of disturbed vegetation that may indicate these structures were part of an old irrigation system. A third item was observed, photographed and mapped as a new component of this site. It was a concrete, square hole that measured approximately 8 by 8 inches.

Location: The site is located north of Federal Avenue and west of Commercial Avenue. It is approximately 360 meters (1181 feet) northwest of the intersection of Commercial and Federal Avenue.

Waste Type: Process Effluent
Waste Description: The waste may have been steam condensate.

---

Code: 600-206
Names: 600-206; 101 Building Graphite Dump Site
Type: Burial Ground
Status: Inactive

Description: The site is a burial ground used for the disposal of scrap graphite and building rubble. The building was plowed into the ground when it was demolished. Remnants of the site remain on the surface. The 101 Building was used during the 1943-1944 construction program for machining graphite for the 100 Areas. It was then declared surplus and partially dismantled. It was reconstructed for machining graphite in 1948.

Location: The dump site appears to be along the southern edge of the 101 Building site, probably along the railroad right-of-way that serviced the building.

Related Sites/Structures: The 101 Building site was located at the Hanford Construction Camp, north of Roosevelt Avenue and North of the Hanford High School, west of Avenue A, in the "V" formed by Avenue A and the powerlines.

Waste Type: Process Effluent
Waste Description: The records appear to indicate that the site received debris from the demolished building. It is unlikely to contain hazardous or radioactive materials. A records review and site inspection reveal no evidence of radioactive or toxic dumping.

---

Code: 600-207
Names: 600-207; Hanford Construction Camp Powerhouse Ash Pile
Type: Dumping Area
Status: Inactive

Description: The site is a large coal ash pile. The pile is pear-shaped and oriented north to south with the wider portion to the south. It is covered with cheatgrass and tumbleweeds. A second smaller ash pile exists to the northwest.

Location: The site is located southeast of the Hanford Construction Camp, approximately 1000 meters (3281 feet) inland from the Columbia River. The site is approximately 780 meters (2559 feet)
The ash pile is located southeast of 10th Street and 740 meters (2428 feet) southwest of Avenue A. The ash pile is located adjacent to the bluff that overlooks the Hanford Construction Camp from the south. The site is accessible from the north by an overgrown gravel road.

**Waste Type:** Soil  
**Waste Description:** The waste is ash that appears characteristic of powerhouse ash and probably came from coal fired power houses used at the Hanford Construction Camp. The dirt road leading to the main site has been overlaid with ash. The waste has been placed in a discernible unit (pile).

<tr>
<td>Description:</td>
<td></td>
<td>The outfall pipeline was a 25-centimeter (10-inch) polyvinyl chloride (PVC) pipeline that was routed to the shore of the Columbia River [approximately 600 meters (2000 feet)] from the TEDF. To protect an archaeological site near the river, the pipeline was laid aboveground, until it was close to the shoreline. At this point, the pipe was routed below grade into a gravel-filled, rock- armored trench. At the shoreline the PVC pipe was transitioned to an 20 centimeter (8-inch) ductile iron pipe that transfers the effluent to the mid-channel single-point diffuser. The diffuser lies on the bottom of the river channel, and consisted of an iron pipe routed through a large, rectangular concrete casing. An angled discharge-pipe bolted directly to the concrete block.</td>
<td></td>

<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Process Description: The outfall discharged treated effluent released from the 300 TEDF. The influent to the 300 TEDF was generated by facilities discharging to the 300 Area process sewer. On September 2, 2009, the discharge from the outfall to the Columbia River was permanently terminated.

Waste Type: Chemicals

Waste Description: The outfall discharges effluent from the 300 Area TEDF to the Columbia River.

Code: 600-211
Names: 600-211; 616A; 616-A; SALDS; State Approved Land Disposal Site
Type: Drain/Tile Field
Status: Active
Description: The site is surrounded by steel posts/chain and posted as "SALDS Building 616A Disposal Field". The cobble terrain is flat with primarily cheatgrass cover. There are seven 5 inch plastic pipes (monitoring ports) that extend two to three feet above grade and one 30 inch sampling access manhole that extends one foot above grade. Two feet below grade in the gravel disposal bed are sixty-six perforated 4 inch diameter distribution laterals branching 90 degrees from an 8 inch diameter feed header. A geotextile and PVC membrane cover the disposal field and are one foot below grade.

Location: About 1200 feet north of the 200 West Area exclusion fence, 1700 feet south of Route 11A, 1100 feet east of the 200 West entrance road to gate 609, and 6500 feet west of Route 3.

Related Sites/Structures: SALDS Disposal Pipeline (600-292-PL), 200 Area Effluent Treatment Facility (2025E), Liquid Effluent Treatment Facility (LERF), 242-A Evaporator, PUREX.

Process Description: The site receives liquid waste that has been treated and verified at the 200 Area Effluent Treatment Facility in 200 East Area. The waste is distributed (below grade) to a gravel bed via perforated pipe. The liquid waste meets delisting requirements of the 216 permit #ST 4500 and is discharged as nondangerous waste; however it may contain tritium.

Waste Type: Chemicals

Waste Description: Treated and verified liquid waste received from the 200 Area Effluent Treatment Facility (ETF). The waste meets the delisting requirements of the 216 permit ST 4500 and is considered nondangerous; however it may contain tritium.

Code: 600-212
Names: 600-212; Relocatable Latrine Facility Holding Tank System
Type: Septic Tank
Status: Active
Description: The site is surrounded with fourteen steel posts painted yellow. The top of the tank is visible at grade level and measures 9 feet by 15 feet. Two concrete covers a located on top of the tank, one has a steel access port for pumping. The electrical conduit for transmitting to the alarm system is visible on top of the tank.

Location: The site is located just west of the 200E area, between Route 4 North and the 200E Perimeter Fence. The site is within the trailer village established for the HWVP Project approximately 8
meters west of MO-730.

**Related Sites/Structures:**

The tank receives waste from MO-730.

**Process Description:**

The HWVP Relocatable Latrine Facility (RLF) Holding Tank System consists of a trailer (MO-730) divided into men's and women's restrooms. Fixtures which drain into the holding tank system include ten toilets, three urinals, six sinks and four self-contained sinks. The latrine trailer is connected to a holding tank via a 4” diameter drain line. The holding tank is a recast concrete vault providing a nominal volume of 5,440 gallons and working volume of 4,500 gallons.

**Waste Type:** Chemicals

**Waste Description:**

---

**Code:** 600-213  
**Classification:** Accepted  
**Names:** 600-213; Hanford Airport Underground Fuel Storage Tanks  
**Reclassification:** Rejected (1/31/2010)  
**Type:** Storage Tank  
**Status:** Inactive  
**Start Date:**  
**End Date:**  

**Description:** The site consisted of underground fuel storage tanks that were associated with the Hanford Airport. The airstrip runways are still visible. A windsock pole is visible just off the southeast corner of the airstrip intersection. Two field walkdowns in 2007 were performed, no visual evidence of building locations or fuel storage tanks were observed. A United States Geological Survey (USGS) June 1, 1948 aerial photograph of the area shows a connecting taxiway between the south end of the north-south runway and the east end of the east-west runway. The photo shows buildings on the southeast side of the taxi-way. The taxi-way has a large north arrow painted on it that is about 61 meters (200 feet) long.

**Location:** The site is located approximately 2 kilometers (1.2 miles) east of the southeast end of Gable Mountain. The site is best approached from Route 2 North on a dirt road which heads west 0.32 kilometers (0.2 miles) north of milepost 1 on Route 2 North. The site is north of the dirt road and approximately 0.8 kilometers (0.5 miles) west of Route 2 North. A metal pipe sticking out of the ground may mark the site.

**Process Description:** The airport consisted of two landing strips, one running almost north and south, and the other east and west. Both strips were 61 meters (200 feet) wide with the north-south strip approximately 1,220 meters (4,000 feet) long and the east-west strip approximately 732 meters (2,400 feet) long. The landing strips were of bituminous stabilized construction, i.e., mixing the surface sand and gravel in place with road oil and rolling to a 15 to 20-centimeter (6 to 8-inch) thick packed surface. Two wood-frame open-type shed hangars and a 5.6 by 12.2-meter (16 by 40-foot) Pacific Hutment were erected east of the air strip intersections. Electrically-driven gasoline pumps, with underground storage tanks, were provided for refueling of Army planes. The airport was totally enclosed by a Type #2, three-strand barbed wire fence. All construction work was performed by Project forces.

---

**Code:** 600-214  
**Classification:** Accepted  
**Names:** 600-214; 600-PSTF; MODU-Tanks; 600 Area Purgewater Storage and Treatment Facility  
**Reclassification:** Closed Out (6/27/2011)
Retention Basin

Type: Retention Basin  Start Date: 1/1/1990
Status: Inactive  End Date:
Description: The site was originally occupied by the RCRA TSD Purgewater Storage and Treatment Facility. The TSD was clean closed under RCRA in June 2011. The facility was inside a fenced area that measured 210 by 150 meters (680 by 480 feet). The two original, above ground RCRA storage tanks (Units #1 and #2) were located in the southeast portion of the fenced area. East of the tanks was the truck unloading area. West of the tanks were two leak detection risers. Unit #1 was demolished in May 2011.

Location: The waste site is located outside the 200 East Area security fence and near the northeast corner of 200 East Area. It is about 400 meters (1,300 feet) north of B-Pond, 750 meters (2,460 feet) east of Canton Avenue, and 300 meters (980 feet) west of the 216-E-28 Contingency Ponds. Tank Unit #1 was south of Unit #2.

Related Sites/Structures: Purgewater from Hanford Site wells is transported to the site by tanker truck and unloaded.

Process Description: Only Unit #1 was operated. Unit #2 never received purgewater. The original Unit 1 modutank provided RCRA, greater than 90-day storage and treatment of purgewater generated from Hanford Site drilling and groundwater monitoring activities. The treatment was solar evaporation. Subsequent Modular Storage Units ( #2 and #3) continue to receive purgewater generated from Hanford Site drilling and groundwater monitoring activities, but under CERCLA authority. Modular Storage Unit #2 was relined and is being used to receive non-RCRA, investigative derived waste (IDW). Modular Storage Unit #3 was constructed and is receiving non-RCRA, investigative derived waste (IDW).

Waste Type: Chemical Release
Waste Description: Wastes include: purgewater from Hanford Facility groundwater monitoring wells. Liquid resulting from well sampling, well development, and aquifer testing. Waste may also include nonregulated purgewater from wells. By permit, purgewater may contain radioactive material, carbon tetrachloride, and other non-specific solvents (F001, F002, F003).

Achieved

Code: 600-215  Classification: Accepted
Type: Storage Pad (<90 day)  Start Date:  
Status: Active  End Date:  
Description: The storage pad is a fenced-in concrete pad covered with an open shed divided into three sections. The fence is on the east and west sides, and connects to the cinder block walls on the north and south sides, which holds up the roof. The fence has six gates, two into each section of the pad. The two northernmost sections of the pad are chained off inside the fence and marked as "Radioactive Materials Area." The floor of the pad is a metal grate that opens to a concrete basin underneath. This basin is about 20 centimeters (8 inches) deep, and is designed to catch any leaks. It does not have any other drain, but appears to be large enough to hold the entire contents of several drums, if they should leak. In April 2000, no water (that may have come from natural spring precipitation) was evident in the basin, but a small amount of vegetation debris had collected in a few spots.

Location: The site is located east of the 200 West Area. It is approximately 100 meters (300 feet) west of the Waste Sampling and Characterization Facility laboratory building.
Process Description: This site is used to temporarily store analytical laboratory waste generated at the Waste Sampling and Characterization Facility (WSCF).

Waste Type: Oil

Waste Description: Analytical laboratory waste is stored at this site.

Names: 600-216; 600-48; H-61-H Anti-Aircraft Artillery Site Building Foundations

Type: Foundation

Status: Inactive

Description: Seven concrete foundations and pads are at this site: #1. A vehicle maintenance shop with a mechanic's trench in the foundation floor and drive-through ability on each end. The dimensions are 34 meters by 14 meters (111 feet by 45 feet). The mechanic's trench is filled with tumbleweeds, but as a place to work it would also have a concrete floor and not be used to drain oil to the ground. #2. Concrete pad, 9 meters by 9 meters (29 feet by 29 feet). #3. Concrete Pad, 6.4 meters by 12.5 meters (21 feet by 41 feet). #4. Concrete kitchen foundation with floor drains and a grease trap. The dimensions are 10 meters by 12.5 meters (33 feet by 41 feet). #5. Concrete pad, 14.6 meters by 5.5 meters (48 feet by 18 feet). #6. Concrete foundation that appears to have been a toilet and shower facility. The dimensions are 14.6 meters by 6 meters (48 feet by 20 feet). #7 Concrete pad, 4 meters by 2.4 meters (13 feet by 8 feet). A large, approximately 12 by 12 meters (40 by 40 feet) open pit is at the site and fenced; the purpose and age of the pit are unknown. There is no evidence of trash in the bottom. Two old building heaters also remain at the site.

Location: This site is located just southwest of the intersection of Route 11 and Route 6. It is 640 meters (0.4 mile) south of Route 11 and just west of Army Loop Road. The site is in the east half of the northeast quarter of Section 34, Township 13 north, Range 25 east.

Related Sites/Structures: Septic system 600-217 serviced this site, and dumping area 600-218 received associated trash.

Process Description: Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

Waste Type: Chemicals

Waste Description: Concrete foundations and pads from former buildings and structures, some containing floor drains and steel anchors.
### Sewer System

**Code:** 600-217  
**Classification:** Accepted  
**Names:** 600-217; H-61-H Anti-Aircraft Artillery Site Sewer System  
**Type:** Sanitary Sewer  
**Status:** Inactive  
**Description:** The sewer system extended from the kitchen, toilet and shower building and ran into a septic tank on the eastern side of the site. The manholes and septic tank have been filled in with clean sand (September 2001). Twelve toilet drains and five floor drains were observed on the toilet and shower building foundation floor. A sewer manhole is located just NE of the toilet/shower building. The kitchen foundation has four floor drains and a grease trap. A sewer manhole is located NW of the kitchen.  
**Location:** This site is located just southwest of the intersection of Route 11 and Route 6. It is 0.4 miles south of Route 11 and just west of Army Loop Road. The site is in the east half of the northeast quarter of Section 34, Township 13 north, Range 25 east.  
**Related Sites/Structures:** This sewer system serviced Anti-Aircraft site 600-216.  
**Waste Type:** Process Effluent

### Foundation

**Code:** 600-219  
**Classification:** Not Accepted  
**Names:** 600-219; H-61-R Radar Site  
**Type:** Foundation  
**Status:** Inactive  
**Description:** A concrete block remains at the site. The concrete block measures 3.4 meters by 3.4 meters by 1.2 meters (11 feet by 11 feet by 4 feet). Wooden structures that had been on each side of the block were consumed in the July 2000 range fire; only charred wood and burlap from sandbags remain.  
**Location:** The H-61-R Radar site is located approximately 160 meters (0.1 mile) southwest of the northwest corner of the 200 West Perimeter Fence and approximately 960 meters (0.6 miles) south of Route 11 and just west of Army Loop Road.  
**Related Sites/Structures:** Site 600-216, the H-61-H Anti-Aircraft Artillery Site, is associated with this radar installation.  
**Waste Type:** Animal Waste

### Depression/Pit (nonspecific)

**Code:** 600-223  
**Classification:** Accepted  
**Names:** 600-223; H-50 Gun Site Pit; Military Camp South of 200W  
**Type:** Depression/Pit (nonspecific)  
**Start Date:**
The site was described in 1987 as a pit that is filled with blown in tumbleweeds. Fence posts and barbed wire are visible on the northwest corner of the pit. A sanitary sewer manhole is located just south of the pit. While the presence of the tumbleweeds made determining if other debris was present impossible when the site was discovered, the July 2000 fire showed that the pit is empty. A plastic orange fence surrounds the pit to warn of falling danger.

The unit is located south of the 200 West Area, 0.6 kilometers (0.4 miles) east of the Rattlesnake Gate and south of Army Loop Road. The pit is located in the southern portion of the H-50 Gun Site just north of the septic tank.

This pit is associated with site 600-39, the building foundations, and 600-224, the site septic system.

The reason for the pit is unknown, and not evident from the surrounding area. There is no evidence of spills or other hazardous material in the pit. The fencing debris at the top end may have been used to mark the site during military operations, but was left when the anti-aircraft site was decommissioned.

The septic system was properly abandoned and Closed Out. It was located in the south portion of the H-50 Gun Site. The tanks have been filled with sand and abandoned in place. Signs reading "Abandoned Septic Tank" are posted.

The system included a manhole, two concrete tanks and concrete block house between the tanks. The first tank is below grade, has three manholes, and measures approximately 3.7 meters by 0.8 meters by 1.5 meters (12 feet by 2.6 feet by 5 feet). The second tank is visible above grade, has two manholes, and measures 1.8 meters by 3.3 meters by 2.7 meters (5.8 feet by 10.7 feet by 9 feet). A concrete block house was located between the two tanks. The structure was demolished and the rubble removed.

The unit is located south of the 200 West Area and .04 miles east of the Guard House on SR 240. The septic system is located in the southern portion of the H-50 Gun Site. (southwest quarter of Section 19, Township 12 North, Range 26 East)
Debris from a demolished block house was located between the two septic tanks.

The septage was removed from both tanks sometime in the past. In July, 2000 the lids were removed from both tanks and the void space in both tanks was filled with a sand slurry. The inert rubble from the block house, which had been left from past demolition activities, was discarded in a landfill.

**Code:** 600-229  
**Classification:** Not Accepted  
**Names:** 600-229; Dumping Area Near White Bluffs Ferry Landing (East Side); RCRA General Inspection 200WFY97 Item #21 Historic Disposal Site  
**Reclassification:** None  
**Type:** Dumping Area  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The site contains several empty rusty 19 liter (5 gallon) steel containers that are partially buried or filled with soil. The site also contains wire, wire rope, and small amounts of sheet metal.

**Location:** The site is located approximately 250 meters (820 feet) downstream from the old White Bluffs Ferry Landing on the east side of the Columbia River and just above the high water mark. The Bonneville Power Administration cross the river approximately 25 meters (82 feet) south of the site.

**Waste Type:** Barrels/Drums/Buckets/Cans  
**Waste Description:** The site contains a relatively small amount of metal such as wire rope, barbed wire, wire, and sheet metal.

**Waste Type:** Barrels/Drums/Buckets/Cans  
**Waste Description:** Several empty rusty 19 liter (five gallon) steel containers are at the site. The containers are partially buried.

**Code:** 600-231  
**Classification:** Not Accepted  
**Names:** 600-231; RCRA General Inspection 200WFY97 Item #5 Historic Disposal Site  
**Reclassification:** None  
**Type:** Dumping Area  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The site contains pre-Hanford debris, including several rusty metal food containers, empty paint cans, buckets, glass, small pieces of concrete, cable, barbed wire, sheet metal, and a rubber tire.

**Location:** The site is located on the right bank of the Columbia River (facing downstream) between 100B Area and 100K Area, approximately 250 meters west of the old Hanford Irrigation Project Pumphouse and approximately 40 yards from the river.

**Waste Type:** Soil  
**Waste Description:** The debris is buckets, cans and wire.

**Waste Type:** Soil
**Waste Description:**
Small pieces of concrete, a rubber tire and glass.

**Description:**
The site is pre-Hanford farmstead debris. The site contains miscellaneous materials including cans, bottles, sheet metal, and wire. The site covers an area approximately 45.7 meters (150 feet) square.

**Location:**
The site is located approximately one mile north (upstream) of the White Bluffs Ferry Landing on the east side of an unnamed island on the Columbia River, approximately 27.4 meters (30 yards) from the edge of the water.

**Waste Type:** Chemicals

**Waste Description:**
The waste is pre-Hanford homestead waste, including metal, glass, and wire.

**Description:**
The site was a treatment facility for petroleum contaminated soil. The site is rectangular shaped with earth berms on all sides. The site is lined with black plastic, soil is spread evenly on top of the black plastic throughout the interior of the site. The site is posted on all sides with signs stating: "WIDS Site 600-236".

**Location:**
The site is located between the 200 East and 200 West areas and is located approximately 300 meters (1000 feet) east-northeast of the 200 Area Fire Station.

**Waste Type:** Soil

**Waste Description:**
Petroleum contaminated soil.

**Description:**
The borrow pits are large, shallow scraped areas along the north and south sides of the stabilized Gable Pond. The stabilized pond surface was vegetated with wheat grass, but the borrow pits are bare.
Location: The sites are located north of 200 East Area, and north of Route 11A, adjacent to the backfilled Gable Pond.

Related Sites/Structures: This borrow pit provided fill for the stabilization of site 216-A-25, Gable Pond.

Process Description: Gable Mountain Pond was backfilled and stabilized in a phased approach, over a four year time span ranging from 1984 to 1988. Clean backfill material was taken from areas adjacent to the north and south sides of the pond. No waste has been put into the borrow areas. Only clean backfill material was removed.

Code: 600-240  Classification: Accepted
Names: 600-240; 615 Hot Mix Plant Debris; Debris in Pit 17; Hanford Aggregate Pit Debris  Reclassification: Rejected (5/31/2001)
Type: Dumping Area  Start Date:
Status: Inactive  End Date:
Description: The site has been reclassified to Rejected. It is metal and wooden debris scattered within Gravel Pit #17. The debris originated from the 615 Hot Mix Plant (sitecode 600-20) and operation of the gravel pit. Some of the pipes and wood are partially buried in scattered locations. The pile is naturally revegetating to grasses and rabbitbrush. To the east of the pit is an irregularly shaped pile of a mix of asphalt pieces, soil, gravel, and cobble, about 12 meters by 3.5 meters by 1 meter high (40 feet by 12 feet by 3 feet high). Rabbitbrush plants have started to colonize the pile.

Location: This site is west of Route 2 North, on the north side of the Hot Mix Plant location.

Release Description: There is no evidence of hazardous or dangerous wastes at the site.

Related Sites/Structures: This pit is related to the adjacent Hot Mix Plant (sitecode 600-20), and adjacent to Pit #16 debris, sitecode 600-239.

Waste Type: Chemicals
Waste Description: The waste is metal pipe, coarse mesh screens, wood, sheet metal, concrete, a rubber tire, and a pile of asphalt pieces mixed with soil, gravel, and cobble.

Code: 600-244  Classification: Not Accepted
Names: 600-244; Gravel Pit #6; Gravel Pit 6; Pit 6  Reclassification: None
Type: Depression/Pit (nonspecific)  Start Date:
Status: Active  End Date:
Description: The gravel pit is a source for gravel used for bedding and backfill material. A gravel road leads into a large irregular shaped pit area. The physical boundaries of the site are larger than the area where gravel is currently being excavated. The boundaries of gravel Pit 6 were expanded in 2008 and again in 2013. The four corners of the pit's largest extents are marked with posts (railroad ties installed vertically). Stock piles of gravel and excavation equipment are present, indicating active gravel pit operations. A chain link fenced equipment storage area is located in the northwest corner of the Pit #6 property.

Location: Gravel Pit #6 is located west of 300 Area, on the west side of Highway Route 4S. It is south of the 618-7 burial ground.
Related Sites/Structures: The Bioremediation Area (WIDS Site 600-243) is located within the boundaries of the Gravel Pit #6 area, and northeast of the current excavation area. WIDS Sites 600-249 is a large spoil pile of dirt, rock, and debris is located in the northwest quadrant of Pit 6. For a short time in 1987, water treatment filter backwash solutions were trucked to this area for disposal (WIDS Site 300 IFBD). WIDS site 300-288:1 (garnet sand) is located inside the 600-249 boundary. WIDS site 300-288:2 (buried debris) is located in the eastern portion of the Pit 6 expansion.

Waste Description: The gravel pit is an approved inert landfill. Waste includes wood, concrete and asphalt.

Code: 600-248
Names: 600-248; Gravel Pit #11; Pit 11
Type: Depression/Pit (nonspecific)
Status: Active
Classification: Not Accepted
Reclassification: None
Start Date:
End Date:
Description: Gravel Pit #11 is a large, rocky excavated area north of the WYE Barricade. It is actively being used as a source of gravel for backfill.
Location: The site is located north of the WYE Barricade, on Route 2S, near mile marker 6, on the east side of the road.
Related Sites/Structures: The site is associated with WIDS Site 600-23, Dumping Area Within Gravel Pit #11.

Code: 600-249
Names: 600-249; Debris Within Gravel Pit 6
Type: Dumping Area
Status: Inactive
Classification: Accepted
Reclassification: Rejected (4/6/1999)
Start Date:
End Date:
Description: The site is areas of miscellaneous material located within Gravel Pit #6. There were spoil piles of material excavated during the construction of the Environmental Molecular Sciences Laboratory (EMSL) facility that are located in the northwest section of the Gravel Pit #6 property boundaries. Miscellaneous debris can be seen in scattered piles and protruding from the soil.
Location: The debris is located in the northwest quadrant of Gravel Pit #6.
Related Sites/Structures: The site is associated with Gravel Pit #6 (WIDS Site 600-244), and WIDS Site 300 ASH PITS. It is also associated with 300-288.

Code: 600-250
Names: 600-250; Metal Debris from RCRA General Inspection #LORIVFY97 Item #4
Type: Dumping Area
Status: Inactive
Classification: Not Accepted
Reclassification: None
Start Date:
End Date:
Description: The site contains miscellaneous debris and ash pit sludge. Visible debris includes metal pipes, PVC pipes, concrete and tires. (The tires and some other debris were removed in 1999 for proper disposal) Periodically, damp ash was trucked from the 300 Area Ash Pits (WIDS Site 300 ASH PITS) and placed in Pit #6. Eventually, the area reserved for the ash became filled. The area was covered with dirt. This is the same area where a bioremediation pad was located (WIDS Site 600-243).
**Description:** The site is a recorded cultural resources site, a historic homestead where rusty sheet metal vent ducting and other miscellaneous debris have been abandoned, including: broken bricks and concrete, old lumber, metal cables and wiring. Some of the debris extends on to the top of the bank, including some half-buried, rusty cans.

**Location:** The site is located approximately 68.8 meters (225 feet) upstream from Columbia River mile marker #26 (Hanford mile marker) and USGS river mile 362. The site is also approximately 36.6 meters (120 feet) from the water's edge (on the date of inspection).

**Waste Type:** Process Effluent

**Waste Description:** The waste is sheet metal and other debris.

**Names:** 600-251; Steel Pipe from RCRA General Inspection #LORIVFY97 Item #6

**Type:** Dumping Area

**Status:** Inactive

**Description:** The site is a near-vertical (tilted at about 20 degrees) steel pipe with the above ground portion of the pipe approximately 1.2 meters (4 feet) in length. The reason the pipe is tilted is not known. The pipe appears to be buried in the ground about 20 feet (6 meters) (John Auten, personal communication, December 19, 2001). The pipe is approximately 0.46 meters (1.5 feet) in diameter and has a 1.3 centimeters (0.5 inches) thick wall. The pipe is rusted and is filled with earth inside the pipe up to the level where it enters the ground. A well identification label is attached to its side (B8542). The pipe is covered with a flat metal lid.

**Location:** The site is located between Hanford mile markers 26 and 27 (USGS river miles 362 and 361). The site is on the south bank of the Columbia River, approximately 45.7 meters (150 feet) from the water edge (at the time of the inspection).

**Waste Type:** Process Effluent

**Waste Description:** The waste is a 40 centimeter (16 inch) diameter steel pipe extending from the ground approximately 1.5 meters (5 feet).

**Names:** 600-252; Old Tank from RCRA General Inspection #LORIVFY97 Item #8

**Type:** Dumping Area

**Status:** Inactive

**Description:** The site is an old, rusty, corrugated steel tank laying on its side. The tank is approximately 2.74 meters (9 feet) long, 0.91 meters (3 feet) in diameter, and has a 25.4 centimeter (10 inch) hole cut in its side near the bottom, and two short schedule 40 pipes on the side at either end (one pipe at each end). This item meets the specific reporting criteria of the inspection as a solid waste disposal site not previously identified for remedial action. During a site inspection on October 8, 1997 the tank was measured to be (8 feet) 2.44 meters long and (3.5 feet) 1.07 meters in diameter with a tape measure.

**Location:** The site is located on the south bank of the Columbia River at Hanford mile marker 2 (USGS
river mile marker 386) and approximately 228.6 meters (750 feet) from the water edge (at the
time of the inspection). The site is also located approximately 1.5 kilometers (0.9 miles) west,
northwest of 100 B/C Area just north of Route 6. A site warning siren located just north of
Route 6 aids in approaching the site. The site is located between the siren and the Columbia
River.

Related Sites/Structures: This tank is part of the old homestead found in the same area.

Process Description: The site was visited on September 26, 2000, with a cultural resource specialist familiar with the
history of the farms in this area. The tank was identified as a water tank because of the lack of
any oil staining inside of or below the tank, and the cuts for the pipes fit irrigation piping but
not typical oil heating or storage systems.

Waste Type: Process Effluent

<tr>
<td>Gravel Pit #24 is a large excavated area that is actively used as a source of gravel and sand material. Because the bottom of the pit reached groundwater, a wetland was deliberately created in 1999 by excavating a little deeper and contouring the bottom to form islands and different depths of water. The pit was expanded to the west in 2000 as a source of additional backfill for remedial actions in the 100 B Area. The pit is located northwest of 100-B/C Area on the north side of Route 6, near the Columbia River. This gravel pit is being used (from 1998 until end of remediation) for backfill at 100 B/C sites remediated as part of site cleanup. A rejected waste site, 600-34, is east of the gravel pit, just off the northwest corner of the 100 B/C Area. It is the site where baled tumbleweeds were dumped. The tumbleweed bales have been removed.</td>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
**Process Description:** Oil Filled Circuit Breakers (OCB's) are used in high voltage areas to extinguish any sparks caused by the triggering of any circuit breaker actions before the sparks can cause damage. The oil in the circuit breakers is usually plain mineral oil. 251-W was built in the 1940's with an underground oil pipeline to fill the circuit breakers. This process ended in the 1960's, and thus the underground oil pipeline system at 251-W has not been used since then. Because PCBs in electrical equipment has been a concern, the potential for these pipelines to be contaminated was evaluated. In the 1970's, manufacturers of new equipment began to use oil that contained polychlorinated biphenyls (PCB's), such as a brand name oil called Askeral. During pumping activities of oil from one circuit breaker to another across the Hanford Site, the equipment became cross contaminated with PCB's. But, because the underground pipelines at 251-W were abandoned in the 1960s, they were not used to carry PCB-containing mineral oil. PCB's became regulated as a hazardous material in 1976. By 1980, the Hanford Electrical Utilities had separate equipment for PCB equipment and non-PCB equipment to stop further cross contamination of equipment and material.

**Waste Type:** Process Effluent

**Waste Description:** In 1996, a section of pipe was removed from the 251-W yard, taken to 212-P, cut up and placed in a barrel. Wipe samples were collected from the outside and inside of the pipe and analyzed at WSCF. All three samples contained less than 1 ppm of PCB and the pipe is considered to be non-PCB material. Since the oil pipeline had been abandoned several years prior to the introduction of PCB oil to the Hanford Site, no PCB contaminated oil would have passed through the pipeline.

<tr>
<td>Description:</td>
<td>The site is a very large, unlined basin. It has a gravel bottom and coble covered sloped sides. There are two effluent pipes protruding from the east wall of the basin. Using the contour patterns on Arcview, it was determined the site is approximately 90 meters (295 feet) long and 30 meters (98 feet) wide.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Location:</td>
<td>The basin is located west of 300 Area, on the west side of Highway 4S.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Process Description:</td>
<td>The stormwater is directed to two collection points inside the 300 Area, located adjacent to the west 300 Area perimeter fence, behind the 3745-B building that has a packed gravel surface. The perimeter fence of the 300 Area is posted with &quot;Underground Radioactive Material&quot; signs. There is no documentation to confirm that contamination exists beneath the gravel surface behind the 3754 Building, but the possibility exists anywhere inside the 300 Area fence. Since no weeds are growing in the gravel, it is possible the gravel is sprayed with herbicide. The water flows through piping, under the highway, to the basin.</td>

Status: Inactive
End Date: 1/1/1995

Description: The concrete foundation pads and portions of the tower structures still remain in the field. There is no visual evidence of a spill at this location. The site is not marked or posted.

Location: Eight 61 meter (200 foot) tall towers were located between 200 West Area and 200 East Area, north of Route 3. They are located near semi-circular gravel roads known as the Arc Roads. The tower of concern was the southern most tower, 9 arc's out from the Met station.

Release Description: In 1995, a decision was made to dismantle the towers and ship them off site to another Federal agency. On April 10, 1995, when the contractor attempted to cut the base of the first leg of the first tower, green liquid was noticed draining out of the tower leg. The contractor stopped work and reported the situation. A maximum of 2.7 liters (0.72 gallons) of liquid had been released to the soil. One cubic foot of damp soil was removed from the spill site and six, 10 gram soil samples were collected. Three soil samples found less than detectable levels of ethylene glycol. Two samples contained ethylene glycol levels below quantities of concern. One sample contained 3830 milligrams of ethylene glycol per kilogram of soil. In order to avoid repeat releases during the tower removals, holes were drilled into the legs of the remaining towers. About 57 liters (15 gallons) of liquid was collected from the remaining tower legs. The rest of the towers were removed without incident.

Process Description: Eight, 61 meter (200 foot) tall towers were used by PNNL to collect data during atmospheric dispersion tests. The eight towers were constructed of aluminum with hollow legs. Atmospheric detection equipment was mounted on the towers.

Waste Type: Chemicals

Waste Description: While dismantling an atmospheric testing tower, approximately 2.7 liters (0.72 gallons) of ethylene glycol was released to the soil on 4-10-95. The damp contaminated soil was removed and place in a barrel. Each year approximately 5.5 liters (1.5 gallons) of ethylene glycol needed to be added to the tower legs. During the 30 year use of the eight towers, it is possible that a maximum of 170 liters (45 gallons) of ethylene glycol could have been released over time to the soil near the bases of the eight towers.

Code: 600-258
Classification: Not Accepted

Names: 600-258; Item #1; RCRA General Inspection Summary Sheet HIRIVFY99
Reclassification: None

Type: Dumping Area
Start Date: 
End Date: 

Status: Inactive

Description: The site is surface debris from pre-Hanford activities. It is on the riverbank, facing the White Bluffs, and is covered with vegetation matching the surrounding terrain. The debris on the ground is mostly old metal wire used to wrap wooden irrigation pipes. It appears to have been pushed over the edge as a way to clean up the fields. A small concrete structure is at the northern edge of the site. The structure appears to have been filled in with dirt, although the dirt could have been piled on top of the cover, posing a cave-in hazard. The debris is very scattered over the length of the site.

Location: The site is located to the northeast of the road that follows the Columbia River, north of the 100-H Area. While the site cannot be seen from the road, it can be found by looking for the marker post shown in the photos.

Waste Type: Chemicals

Waste Description: The material consists of rusted metal wire used to wrap wooden irrigation pipes, old bedsprings, food cans, a small concrete box (filled in with soil), and a little broken glass.

<td>There are seven cans scattered within a distance of 2 meters (6.6 feet) of each other. The cans are rusty and approximately 20 centimeters (8 inches) long. Most of the cans are broken open, revealing their current contents of calcium carbonate. No vegetation stress was noticed. A few of the cans were intact, but appeared to be empty. Some lettering could be seen on the cans. Some of the cans were marked &quot;RL - HAR, 300 Order, -------MMABLE, Sealed For Use&quot; One intact canister is located approximately 6 meters (20 feet) from the group of ruptured cans. It has lettering that reads &quot;-------RAY, ___HARGE, Y-45-SE-6&quot;. The cans are located in the White Bluffs area. They are northeast of the intersection of Route 2 and Federal Avenue, and northeast of the old White Bluffs Bank building. Conversations between the Hanford Fire Department and the U.S. Army Corp of Engineers determined the cans originally held calcium hydride, which was used to produce hydrogen for weather balloons. In the presence of water calcium hydroxide produced hydrogen and calcium hydroxide; calcium hydroxide exposed to the environment becomes calcium carbonate. The chemical originally in the cans was calcium hydride, with a chemical formula of CaH2-. Hydrogen and calcium hydroxide are produced when calcium hydride is mixed with water. Calcium hydroxide rapidly decomposes to calcium carbonate in the environment.</td>

When discovered, the 55 gallon drum was laying on its side, surrounded by orchard smudge pots. The drum was inside a recently erected "Caution" tape barrier. No soil discoloration was noted in March 2000, but according to Ron Del Mar, who made the report when the drum was removed (April 18, 2000), there had been past spills to the ground from the drum. A field visit in September 2000 showed a small area of old, hardened oil-soaked ground. This oiled area was removed in June 2001. Two other drums were nearby, one to the south and one to the north. Both of these drums were empty and neither showed discolored soil underneath.

The site is located 1333 meters (0.83 miles) northwest of Gravel Pit 24, west of 100-B Area.

Process Effluent

The oil remaining has hardened on the ground surface.

600-265

Unidentified Pipes Near the 618-10 Burial Ground

Depression/Pit (nonspecific)

The site consists of two, 5 centimeter (2 inch) diameter, stainless steel pipes protruding approximately 10 centimeters (4 inches) above ground. The pipes are approximately 1.5 meters (5 feet) apart. Each stainless steel pipe has a rusted pipe inserted in the center that extends approximately 0.6 meters (2 feet) above ground.

The site is located approximately 15.25 meters (50 feet) west of the 618-10 Burial Ground.

618-10; 300 North Solid Waste Burial Ground; 318-10

This site was discovered after the June 2000 fire. Large sagebrush had been concealing the debris. After the fire destroyed the sagebrush, an area of about 20 by 20 meters (65 by 65 feet) containing most of the trash was noted. Other material trailed off to the north. The debris (except for the cable) was removed within a month after the fire exposed it.

The site is about 50 meters (150 feet) northwest of Highway 240, about 300 meters (1,000 feet) west of Gate 117A.

Ash

Metal, glass, cinder blocks, and transite debris had been disposed here, but are now removed.

- Inactive
- Inactive

**Start Date:**
- 1/1/2000
- 1/1/1995
- 1/1/1998

**End Date:**
- 1/1/2000
- 1/1/1998

**Description:**
- When active, the waste at the 90 Day Pad was stored in steel drums inside a locked metal shed on the east side of the 622 F Weather Station building.
- The storage area and laydown yard are enclosed by a 2.4 meter (8 foot) chain link fence. The center coordinates for this site as mapped are N138108.06, E575288.25. The 90-Day Storage Pad was located in the northeast corner of the fenced area. In May 2004, the locked chain link fence was empty, except for a single conex box. The sign on the gate says PNNL, Bob Reidel and CAT 2 Non Traceable.
- The area used for 90 Day accumulation area was part of a larger laydown area enclosed by the chain link fence, located in the northeast corner of the pipe yard. It was used to store 17 drums of mixed and radioactive waste from well maintenance activities, generated between 1993 to 1996.
- Seventeen drums of mixed and radioactive waste from 200 West Area well drilling activities (generated between 1993 and 1996) were stored at the site. The groundwater in 200 West Area is contaminated with carbon tetrachloride. The drums contained a mixture of solids, sand and slurry. The drums were designated as F001/carbon tetrachloride. No leaking, damage or evidence of spills was ever recorded at this site. All the drums were removed in May 1998. They were shipped offsite.

**Location:**
- The weather station complex is located on Route 6, east of 200 West Area and north of the Waste Sampling Characterization Facility (WSCF). The storage area was located on the east side of the 622-F building.
- The 90-day accumulation area was located inside the 200 East Pipe Laydown Area, north of the 200 East Area 810 gate.

**Waste Type:**
- Equipment
- Process Effluent

**Waste Description:**
- The waste was stored in steel drums, inside a metal shed on the east side of the 622 F Weather Station. The pad was closed on August 29, 2000. At closure, all dangerous waste and dangerous waste residues were removed from the containment system. Remaining containers, liners, bases and soil or contaminated residues were decontaminated or removed. No spills occurred at this site. There is no future need for this storage area and the area has been officially closed in compliance with the closure requirements of WAC 173-303-630(10).
- The area used for 90 Day accumulation area was part of a larger laydown area enclosed by the chain link fence, located in the northeast corner of the pipe yard. It was used to store 17 drums of mixed and radioactive waste from well maintenance activities, generated between 1993 to 1996.
- Seventeen drums of mixed and radioactive waste from 200 West Area well drilling activities (generated between 1993 and 1996) were stored at the site. The groundwater in 200 West Area is contaminated with carbon tetrachloride. The drums contained a mixture of solids, sand and slurry. The drums were designated as F001/carbon tetrachloride. No leaking, damage or evidence of spills was ever recorded at this site. All the drums were removed in May 1998. They were shipped offsite.
**Names:** 600-269-PL; Cross Site Transfer Line Replacement; Lines SNL-3150 and 3160; New Cross-Site Transfer Line  
**Type:** Direct Buried Tank Farm Pipeline  
**Status:** Active  
**Start Date:** 1/1/1995  
**End Date:**  
**Description:** The site is an underground pipeline. It is marked on the surface with Underground Radioactive Material - Pipeline signs. It passes through Diversion Box 6241-A, located east of Beloit Ave. in 200 West Area. The line continues to the Vent Station 6241-V, located between 200 East and West areas, and runs northwest of the 241-EW-151 Vent Station. A short portion of the pipeline ties into the former termination point at the 244-A Lift Station. A segment of pipeline was extended to 241-AN Tank Farm.

**Location:** The pipeline extends from 241-SY Tank Farm inside 200 West Area to the 244-A Lift Station in 200 East Area. A large portion of the line is located between the 200 West and 200 East areas, south of Route 3. A segment of pipeline was extended to 241-AN Tank Farm.

**Related Sites/Structures:** The pipeline is associated with the 244-A lift station, Diversion Box 6241-A and Vent Station 6241-V.

**Waste Type:** Process Effluent

**Waste Description:** The underground encased line transfers tank farm liquid waste between 200 West Area and 200 East Area.

---

**Names:** 600-276; Cold Test Facility; GEDF; Hanford Geotechnical Engineering and Development Facility; Little Egypt  
**Type:** Laboratory  
**Status:** Inactive  
**Start Date:** 1/1/1982  
**End Date:**  
**Description:** The site is surrounded with light posts and chain. A vehicle gate is posted "Authorized Personnel Only". The site is a large open field with a high mound of soil in the center. Several pipes extend vertically through the surface of the soil in some areas. A small pallet containing damaged bags of bentonite is located in the southeast corner of the area adjacent to some vertical pipes. Two steel hinged plates cover access holes to underground culverts used as monitoring stations for buried waste tests.

**Location:** The site is located approximately 4 miles northwest of 300 Area, west of Route 4 South.

**Related Sites/Structures:** This waste site is associated with sitecode 600-367, buried mobile office.

**Process Description:** The Hanford Geotechnical Engineering and Development Facility became operational in 1982 to test burial ground subsidence control alternatives. The original site consisted of three test areas. Each test area was a cluster of buried simulated waste with a center monitoring caisson. The monitoring caissons were underground rooms constructed of a circular corrugated metal, measuring 3 meters (10 feet) in diameter and 2.5 meters (8.5 feet) deep. The monitoring caissons had a metal roof and a personnel access hatch. Each caisson contained an array of monitoring equipment. Each cluster contained three areas of buried simulated waste. The
simulated waste consisted of boxes containing styrofoam and wood chips and stacks of buried 208 liter (55 gallon) drums. Later, the site was used to perform "cold test" demonstrations of geotechnical engineering prototype systems for in situ isolation and stabilization of waste disposal structures. Mock up burial trenches, caissons, vertical pipe units, drain fields, waste transfer lines and cribs were installed in the area for grout treatment and equipment testing purposes. The site contains nine areas containing simulated buried waste. The 1994 Technical Task Plan Proposal states the site also includes four tile fields and two underground storage tanks. However, Steve Phillips stated that no storage tanks or tile fields were ever placed at this site. In 1986, an area containing caissons, designed to represent the types of caissons used for Hanford waste, was installed.

**Waste Type:** Process Effluent

**Waste Description:**
Only simulated buried waste was placed into this test site.

**Hanford Site Waste Management Units Report**

February 2015
### Unplanned Release

**Type:** Unplanned Release  
**Status:** Inactive

**Description:** During the 2010 geophysical investigation it was noted that the site was flat terrain with grasses and occasional rabbit brush. Originally the site was thought to consist of potential underground components of a service station, including storage tanks, associated piping, and contaminated soils.

**Location:** The site's historical location is on the east side of Division Street, south of Avenue A and west of the administration building (IN-323). Further historical research indicated that the service station maybe located on the east side of Division Street, south of Avenue A and east of the theater building (IN-163 and IN-321). The coordinates for the site are E585804.0, N139435.0.

**Process Description:** This site was used for the dispensing of petroleum products for automotive use. The specific location of underground storage tanks and associated piping for this site are unknown.

**Waste Type:** Chemicals

**Waste Description:** The waste consists of underground storage tanks, associated piping and underlying soil.

---

### Code 600-335

**Classification:** Accepted  
**Reclassification:** Rejected (6/10/2010)

**Names:** 600-335; Service Station and UST

**Type:** Unplanned Release

**Status:** Inactive

**Description:** During the 2010 geophysical investigation it was noted that the site was flat terrain with grasses and occasional rabbit brush. Originally, the site was thought to consist of potential underground components of a service station, including storage tanks, associated piping, and contaminated soils, that were identified in historical photo # P-8244. The photo also appears to show two gasoline pumps.

**Location:** The coordinates for the site are E585924.0, N139746. The site is located approx. 54 meters (177 feet) to the SW of the former 145 Building.

---

### Code 600-336

**Classification:** Accepted  
**Reclassification:** Closed Out (11/4/2009)

**Names:** 600-336; 609-G Septic Tank and Tile Field; 6607-03; 6607-3

**Type:** Septic Tank

**Status:** Inactive

**Description:** The waste site is an underground septic tank and tile field. It was properly abandoned in 1998. A new regional septic system, built in 1997, replaced the need for individual septic tanks.

**Location:** The septic tank and tile field are located south of Route 3, southwest of the 200 Area Fire Station.

**Related Sites/Structures:** The septic system was associated with the 609-G office facility.

**Closure Info:** The septic tank and tile field were abandoned per WAC codes in 1998.
**Code:** 600-337  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 600-337; 6290 Building Drain Field; 6607-01; 6607-1; Rigging Services Facility Septic  
**Type:** Septic Tank  
**Status:** Active  
**Start Date:** 1/1/2003  
**Location:** This septic system is located outside the west perimeter fence of 200 East Area. It is northeast of the 6290 Rigging Facility.  
**Process Description:** A new tank was installed to meet facility expansion requirements.

**Code:** 600-396  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 600-396; 600-396 Debris Pit near Riverland Dumping Area  
**Type:** Dumping Area  
**Status:** Inactive  
**Start Date:**  
**End Date:**  
**Description:** The waste site is a soil depression filled with rusted cans and broken bottles.  
**Location:** The pit is located about 100 feet south of Riverland Rd (aka Priest Rapids Rd) and west of Route 24. It is south of WIDS sitecode 600-101. Coordinates for the pit are N143410.28 E558809.12.

**Code:** 616  
**Classification:** Accepted  
**Reclassification:** Closed Out (10/24/2001)  
**Names:** 616; 616 Building Non-Radioactive Dangerous Waste Storage Facility; 616 Nonradioactive Dangerous Waste Storage; 616 NRDWSF  
**Type:** Storage  
**Status:** Inactive  
**Start Date:** 1/1/1986  
**End Date:** 1/1/2001  
**Description:** The 616 Nonradioactive Dangerous Waste Storage Facility (NRDWSF) is a Clean Closed Resource Conservation and Recovery Act Treatment, Storage unit (RCRA TSD). The above ground building was partitioned into six areas, referred to as cells, for storage of different types of hazardous waste. The facility also contains an office and a material handling area.  
**Location:** This site is located on the north side of Route 3, between 200 East and 200 West across from the fire station.  
**Related Sites/Structures:** Drains in the two outdoor loading pads discharged to the 616-WS-1 French Drain. The building is connected to the 6607-5 Septic System.  
**Process Description:** This facility provided container storage for nonradioactive dangerous waste generated in the research and development laboratories, process operations, construction, waste site cleanup/remediation, environmental monitoring, maintenance, and transportation functions throughout the Hanford Facility and approved off site facilities. The 616 NRDWSF operated as a clean, well maintained, nonradioactive dangerous waste container storage unit. Detailed storage records were maintained. Only containers of the proper type and in good condition were accepted. Storage and loading area containment was designed to preclude spills from reaching soil, and containment surfaces were maintained to ensure integrity. Waste was managed to minimize the potential for spills. The latest operating methods and administrative
controls required waste spills to be cleaned up promptly and completely and the waste removal area to be analytically verified.

**Waste Type:** Process Effluent  
**Waste Description:** No wastes remain in the facility. The facility had provided container storage for nonradioactive dangerous wastes. These wastes consisted of listed wastes, wastes from nonspecific sources, characteristic wastes, and state-only wastes.

**Closure Info:** Because operating records did not demonstrate that early operations within the 616 facility met spill cleanup requirements, the building was considered potentially contaminated and underwent decontamination. Equipment used for waste handling was removed. The storage cell floors, sumps, trenches, and outdoor loading pads were cleaned using nonregulated detergents. The rinsates were collected, analyzed, designated and disposed of as nondangerous waste. Some minor residual staining/discholoration of coated surfaces remained after decontamination. This was allowed in the closure plan.

Completion of closure plan requirements was certified by a Professional Engineer on 6/13/2001. The RCRA permit Closure Certification was transmitted to the Washington Department of Ecology on 9/5/2001. Ecology accepted the Closure Certification on 10/24/2001.

Sampling of theFrench drain was required as part of the Closure Plan for the 616 facility. The gravel within the French drain was removed and stored pending sampling results. A single soil sample was taken from the center of the drain. The sample was analyzed for pH, volatile organic compounds, semi-volatile organic compounds, RCRA (Resource Conservation and Recovery Act) metals, PCBs, herbicides, pesticides, phosphorous pesticides, cyanide, total organic halides, anions, phenols, and chrome VI. The sample met closure standards for all constituents.

---

**Code:** 618-6  
**Classification:** Accepted  
**Reclassification:** Rejected (10/7/1998)

**Names:** 618-6; Solid Waste Burial Ground #6  
**Type:** Burial Ground  
**Start Date:** 1/1/1943  
**End Date:** 1/1/1944  
**Status:** Inactive  
**Description:** The 618-6 Burial Ground was originally located in the southeast corner of 300 Area near where the 325 Building is currently located. The waste was exhumed and relocated twice to allow for 300 Area construction expansions. In 1962, the contents were permanently moved to the 618-10 Burial Ground.

**Location:** This burial ground has been moved twice. The site was first located in the southeast corner of the 300 Area. Then the contents of the site were moved to just south of the 316-1 Process Pond. Finally, the contents were exhumed again and moved to the 618-10 Burial Ground.

**Waste Type:** Process Effluent  
**Waste Description:** The unit contained solid uranium waste.

---

**Code:** 622-1  
**Classification:** Accepted  
**Reclassification:** Rejected (5/31/2001)

**Names:** 622-1; Construction and Demolition Debris  
**Type:** Dumping Area  
**Start Date:**  
**End Date:**  
**Status:** Inactive

*Hanford Site Waste Management Units Report*  
February 2015
Description: The site is no longer marked or posted.

Location: This site is located south of the intersection of Sixteenth Street and Albany Avenue outside the perimeter fence of the 200 West Area.

Waste Type: Process Effluent
Waste Description: Some 208-liter (55-gallon), 19-liter (5-gallon), and 4-liter (1-gallon) containers were present at the site.

Waste Type: Process Effluent
Waste Description: The site contained miscellaneous trash.

Waste Type: Process Effluent
Waste Description: The site contained friable asbestos.

Waste Type: Process Effluent
Waste Description: The site contained transite siding.

Code: 622-R ST  Classification: Accepted
Names: 622-R ST; 6607-02; 6607-2; 622-R Atmospheric Physics Laboratory Septic Tank; 622-R Septic Tank  Reclassification: None
Type: Septic Tank  Start Date: 1/1/1965
Status: Inactive  End Date:
Description: This site consists of a septic tank, distribution box, and tile field. The septic tank is available for use as an emergency holding tank. The rest of the system has been abandoned.
Location: This site is located just northwest of the 622-R Atmospheric Physics Laboratory Building. This building is northwest of the 200 West Area between Route 2 and Route 3.
Related Sites/Structures: The associated structure is the 622-R Building.
Process Description: This site provided sanitary sewage disposal for the 622-R Building. A pump station was added in 1997 to reroute raw sewage to Septic System 6607-09. The septic tank was emptied and will remain available as an emergency holding tank in case of pump failure. The effluent has been routed to 6607-9.
Waste Type: Soil
Waste Description: The unit received sanitary wastewater.

Code: 6241-A  Classification: Accepted
Names: 6241-A; 6241-A Diversion Box  Reclassification: None
Type: Diversion Box  Start Date: End Date:
**Description:** 6241-A is a booster station for the new cross site transfer pipeline. The building is a radiological facility.

**Location:** The site is located southeast of 221-U, east of Beloit Avenue, between 13th and 16th Street.

**Related Sites/Structures:** The diversion box is associated with the Replacement Cross Site Transfer Line (WIDS sitecode 600-269).

**Process Description:** The main structure (room 105) is an underground building with the top of the roof approximately 0.75 meters (2.5 feet) above finish grade. This structure houses two booster pumps and is designed for maintenance access on an infrequent basis. It is cast-in-place concrete equipped with a stainless steel floor liner at the base floor level. A steel shield floor is located 1 meter (3.3 feet) above the base floor with the process piping underneath.

**Waste Type:** Process Effluent

**Waste Description:** Some residual waste will be found in the dead legs of the piping systems.

---

**Code:** 6241-V  
**Classification:** Accepted

**Names:** 6241-V; 6241-V Vent Station  
**Reclassification:** None

**Type:** Control Structure  
**Start Date:**

**Status:** Active  
**End Date:**

**Description:** The vent station is a radiologically controlled facility. Contamination is on the surfaces below the deck plates.

**Location:** The site is located half way between 200 East and 200 West Areas, south of Route 3, south of the 200 Area Fire Station.

**Related Sites/Structures:** The vent station is associated with the Replacement Cross Site Transfer Line (WIDS sitecode 600-269).

**Process Description:** The vent station is located at the hydraulic high point of the RCSTS, and the pipeline slopes down continuously from this point to the two ends. The main structure (room 105) is an underground building with the lower half of the building below finish grade. It houses the transfer piping and other items that support operation of the RCSTS and is designed for maintenance access on an infrequent basis. The main structure is cast-in-place concrete equipped with a stainless steel floor liner and a carbon steel shielding floor located above the transfer piping.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** Some residual waste will be found in the dead legs of the piping systems.

---

**Code:** 6607-1  
**Classification:** Accepted

**Names:** 6607-1; H-40 Gun Site Septic Tank  
**Reclassification:** Rejected (9/10/2010)

**Type:** Septic Tank  
**Start Date:** 1/1/1945

**Status:** Inactive  
**End Date:** 1/1/1958

**Description:** This site includes a manhole located near the kitchen/mess hall and toilet/shower foundations and a below ground concrete septic tank with three manholes. The manholes and the septic
tank have been backfilled with clean pit run material and are no longer visible, and the ground over the tank is gravel as of June 2001.

**Location:**
This site is located 1.1 kilometers (0.7 miles) southeast of the southeast corner of 200 East Area, on the south side of Route 4 South. Trees viewed from Route 4 South aid in locating the site. The septic tank is located in the eastern portion of the H-40 Gun Site.

**Related Sites/Structures:**
The site is associated with 600-227 (the H-40 Gun Site Building Foundations kitchen and toilet/shower buildings).

**Process Description:**
This site provided sanitary sewage disposal for a former U.S. Army facility. Typically, Camp Hanford's anti-aircraft artillery sites were each roughly 20 acres in size and contained any number of buildings (typically around 20), various utility distribution systems, roads, and sidewalks. Each site consisted of emplacements protected by revetments made of sandbags and wood planking, wooden structures, prefabricated metal buildings, and, later, permanent, concrete block structures. The prefabricated buildings had aluminum walls and roofs with wooden or concrete floors set on concrete pier blocks and were the most commonly constructed. The permanent structures included barracks, latrines, mess halls, craft shops, pump houses, motor pools, and radar facilities. Each site typically had a small arms range, water storage cistern, sanitary, and sewage disposal facilities. Pathways, sidewalks, roadways, and parking lots connected the structures.

**Waste Type:**
Steam Condensate

**Waste Description:**
The unit received unknown amounts of sanitary sewage.

**Waste Type:**
Steam Condensate

**Waste Description:**
The tank contains water to a depth of 0.9 meters (3 feet).

<tr>
<td>Description:</td>
<td>This site includes a manhole, two septic tanks and connecting tile field. In May 2001, the open holes associated with the septic system were backfilled. The original manhole measured 71 centimeters (28 inches) diameter by 86 centimeters (34 inches) deep, with two inlet pipes, one outlet pipe and is constructed of cement bricks and mortar. The large septic tank is below grade and had three manholes and a concrete box structure visible above grade. The manholes were covered with concrete covers. The center manhole was broken providing visual access to the interior of the tank, prior to being backfilled. In 1997, the tank contained water. An above ground structure, located at the west end of the tank, appears to have been used as a pumping station to pump liquid to the smaller tank located to the west. The overall site dimensions of the large tank are 21 by 9 meters (70 by 30 feet). The small tank to the west measures 2.2 by 1.7 meters (7.3 by 5.8 feet) and has one covered manhole. The structures had been surrounded by orange plastic fencing, but the fencing was destroyed in the 2000 grass fire. The open features were backfilled in 2001.</td>

**Location:**
The site is located 6.4 kilometers (4 miles) south of 200 East Area, on the south side of Army Loop Road and east of the powerline road to Rattlesnake Mountain.
Process Description:
This site provided sanitary sewage disposal for a U.S. Army Facility.

Related Sites/Structures:
The site received sanitary sewage from the 600-49, H-42 Gun Site Building toilet/shower building and the kitchen/mess hall building.

Waste Type: Process Effluent
Waste Description:
The unit received unknown amounts of sanitary sewage.

Waste Type: Process Effluent
Waste Description:
The septic tank contained water at the time of the inspection.

---

Code: 6607-3
Classification: Accepted

Names: 6607-3; Anti-Aircraft Artillery Site H-51 Septic Tank
Reclassification: Rejected (9/10/2010)

Type: Septic Tank
Start Date: 1/1/1945
End Date: 1/1/1955

Status: Inactive

Description:
The septic tank is constructed of concrete, has three open manholes and an above ground square concrete box-like structure located on the east end. This box-like structure may have been used to support a pump for pumping liquid to the drain field. The tank is below grade. The roped off section measures 17 by 4.6 meters (55 by 15 feet) and the tank interior is 3.4 meters (11 feet) deep. The drain field is located east of the septic tank. The septic tank and four manholes are delineated by orange plastic fencing.

Location:
This site is located approximately 2.4 kilometers (1.5 miles) southwest of 200 West Area just west of Army Loop Road between Highway 240 and Army Loop Road.

Related Sites/Structures:
The site is associated with the former U.S. Army Anti-Aircraft Gun Site H-51, which is sites 600-53 (the building foundations) and 600-220 (the dumping areas).

Process Description:
This site provided sanitary sewage disposal for a U.S. Army Facility.

Waste Type: Process Effluent
Waste Description:
The unit received unknown amounts of sanitary sewage.

---

Code: 6607-4
Classification: Accepted

Names: 6607-4; 6607-4 Septic System; Replacement for 2607-FSN; 609A Building Septic Tank; 6607-04
Reclassification: None

Type: Septic Tank
Start Date: 1/1/1989
End Date: 

Status: Active

Description:
The septic tanks consist of two concrete tanks placed in series. The design capacity of the tanks was 1800 gallons (6813 liters) with the first tank being 1200 gallons (4542 liters) (minimum) and the second being between 600 and 1000 gallons (2271 liters and 3785 liters).

Location:
The septic system is located east of the 609-A Building (200 Area Central Fire Station) and...
south of Route 3. The septic tanks are approximately 100 feet east of the northeast corner of the 609-A building. The drainfield is located just east of the tanks.

**Related Sites/Structures:**
The 6607-4 septic system is associated with the 609-A building and the 2607-EP septic system.

**Waste Type:** Chemicals

**Waste Description:** The system receives sanitary sewage from the 609-A building.

<td>Status: Inactive</td>
<td>End Date: 1/1/1995</td>
</tr>
</tbody>
</table>

Description: The site consisted of two demolition areas that were used by the Hanford Patrol to detonate discarded explosive chemical products generated on the Hanford Site. These products were either excess material or beyond their designated shelf life. The RCRA TSD permit was closed on 10/26/1995.

The site was a treatment unit for nonradioactive explosive, ignitable, shock-sensitive, and/or reactive discarded chemical products. The discarded chemical products treated at the site all exhibited the dangerous waste characteristics of ignitability and reactivity. Some of the discarded chemical products also exhibited the dangerous waste characteristic of corrosivity and may have had the state-only designations for toxic extremely hazardous waste, toxic dangerous waste, persistent halogenated hydrocarbons, extremely hazardous waste, persistent polycyclic aromatic hydrocarbons, extremely hazardous waste, and/or carcinogenic dangerous waste.

The treatment design capacity of the site was 568 liters (150 gallons) of discarded explosive chemical products per day. The last detonation event at the site took place on October 27, 1991.

Location: The site is located northwest of 1100 Area and west of 300 Area.

Waste Type: Steam Condensate

Waste Description: The unit was used for the treatment of shock-sensitive or potentially explosive chemical wastes. The following detonations took place: 1984: Ethyl Ether 169 g (0.37 lb), Perchloric Acid 44.3 kg (97.7 lb), Nitric Acid 1.42 kg (3.13 lb); 1985: 2,4,6-Trinitrorescorcinol 25 g (0.06 lb), 2,4-Dinitrorescorcinol 70 g (0.15 lb), 2,4-Dinitrophenol 500 g (1.10 lb), Alpha-Nitosomethylisobutylketone 174 g (0.38 lb), Trinitrotoluene 100 g (0.22 lb), Tetrahydrofuran 36 kg (79.4 lb), Picryl Chloride 300 g (0.66 lb), Picric Acid 100 g (0.22 g), Perchloric Acid 4.4 kg (9.7 lb), Ethyl Ether 4.7 kg (10.4 lb), Hexadinitrophenylamine 70 g (0.15 lb), Glycol Dimethyl Ether 500 g (1.1 lb), Carbon Trichloride 600 g (1.3 lb), Carbon Disulfide 1,100 g (2.4 lb), Butyl Ethanol 9.5 kg (20.9 lb), Butyl Cellosolve 100 g (0.22 lb), Benzene with N-Butyl Lithium 100 g (0.22 lb); 1986: None; 1987: Ethyl Ether 20 kg (44.1 lb), Picric Acid 200 g (0.44 lb).

Description: The 90 Day Storage Area was inside the 1164 Building, a small (15 by 11 meters [48 by 36 feet]) steel structure surrounded by gravel and pavement. The Building is closed, and has transferred to the Port of Benton. However, the Port has not started to use it yet.
**Location:** The 1164 Building is northeast of the 1167A Excess Salvage Office Building. The 1164 Building is also marked as the 2453 Building. The exact location of the pad within the building is not known.

**Related Sites/Structures:** The pad held waste paint aerosol cans and associated equipment waste used at the Excess Salvage Yard.

**Process Description:** The 90 Day Storage Area was used by the Investment Recovery group to process aerosol cans, which were used to identify sensitive equipment for central stores and investment recovery, along with rags, brushes, and other miscellaneous wastes.

**Waste Type:** Barrels/Drums/Buckets/Cans

**Waste Description:** The wastes stored here were materials (for example, rags and brushes) and paints left over from marking sensitive equipment.

**Names:** 1100-12; 1100-12 Dumping Areas

**Type:** Dumping Area

**Status:** Inactive

**Description:** The site is miscellaneous pre-Hanford debris consisting of old concrete, glass, and metal (e.g., camp stove, food cans, buckets, and wire). The decayed batteries previously reported were not seen on May 4, 2000. Two separate areas of debris were reported in 1996 and 1998, but only one is evident in 2000.

**Location:** The debris fields are located in the northern portion of the 1100 area and just south of the powerline road that runs east-west. They are east of the ATG facility and 500 meters west of Stevens Drive.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** Dry cell batteries were observed at the site in 1996. Vegetation surrounding the batteries was reported to be stressed in 1996, but no sign of the batteries was found in 2000.

**Names:** 1100-13; Gravel Pit #1; Pit 1

**Type:** Depression/Pit (nonspecific)

**Status:** Active

**Description:** The site is a pit where sand was excavated to be used for bedding and backfill material. The northern perimeter is marked with post and chain.

**Location:** Pit #1 is located north of the 1100 Area, north of the 1171 Laydown Yard.

**Related Sites/Structures:** UPR-1100-6 is located adjacent to Pit 1.
### Reclassification: 1100-14; Gravel Pit #2; Pit 2
### Depression/Pit (nonspecific)
### Inactive

**Start Date:** 1/1/1954  
**End Date:** 1/1/1985

**Description:** The pit was a source of gravel for backfill material. It also was used as a dumping site for miscellaneous debris, paint and solvents.

**Location:** The pit is located north of 1100 Area and north of the 1171 Laydown yard.

**Related Sites/Structures:** 1100-2 Paint/Solvent dump

### Reclassification: 1100-15; Gravel Pit #3; Pit 3
### Depression/Pit (nonspecific)
### Inactive

**Start Date:** 1/1/1979  
**End Date:** 1/1/1985

**Description:** The site was used as a source of gravel for backfill material. It was also used as a disposal site for construction material (concrete rubble and roofing material). Occasionally antifreeze and degreaser solutions from the 1171 building were disposed into the pit.

**Location:** The pit is located north of 1100 Area, north of the 1171 Laydown Yard, on the west side of the railroad tracks.

**Related Sites/Structures:** The site was associated with 1100-3 Antifreeze, Degreaser Pit.

### Reclassification: 1100-18; Cistern and Possible Historic Disposal Site Identified During RCRA General Inspection 1100FY’98 Item #3
### Dumping Area
### Inactive

**Description:** The site appears to be a cistern. In the general area of the cistern is a homestead dump site. There appears to have been a well casing inside of the cistern. The casing is plugged approximately 1.5 meters (5 feet) below the ground surface.

The cistern is in the middle of an old concrete pad and is lined with concrete (at least as much as is visible). The area between the sides of the cistern and the metal well casing is filled with large rocks and cobbles. Connected to this concrete pad, there appears to be another concrete-lined, rock-filled hole. The second hole is now very overgrown and is filled with large rocks and cobbles. It appears to have been rectangular and may have had a wooden cover. A snake was living under the remains of this wooden cover. North of the cistern are the remains of a wire mesh fence and an old household dump (cans primarily, some glass and ceramics). Further north, there is a smaller concrete structure. It is square and is now filled with dirt and vegetation. Overall, the site is mostly grass-covered, with some mature sagebrush and tumbleweeds. Debris is concentrated in the household dump, but there is some scattered debris across the site, including the metal frame of a coil mattress. The features mentioned thus far...
(with the exception of the small concrete structure) are south of an extensive ditch (irrigation). Northeast of the cistern and north of the ditch, a cement pipe was found extending into the ditch. Just north of this feature, some of the cement pipe is exposed. This could considered a physical hazard. Southeast of the cistern are the remains of an old foundation. The cellar presents a physical hazard. Adjacent to the foundation is a small, thin area of coal, level with the ground surface.

**Location:** The site is located approximately 274 meters (900 feet) west of Stevens Drive and 91 meters (300 feet) north of the east/west power line and dirt road to the Allied Technical Group (ATG).

**Waste Type:** Misc. Trash and Debris

**Waste Description:** The waste consists of a cistern (with an interior well casing), several other concrete structures, a foundation, and miscellaneous debris (cans, glass, ceramics, an old mattress frame).

*Hanford Site Waste Management Units Report*

February 2015
Waste Type: Stormwater Runoff
Waste Description: The unit was never used to process neutralized current acid waste. However, cell and tank contamination from previous operations may have been transferred to the filter.

Code: BTTF
Names: BTTF; Biological Treatment Test Facilities
Type: Laboratory
Status: Inactive
Description: The unit consisted of various laboratories in the 324, 325, and 331 Buildings. The processing equipment covered under this unit included lab, bench, pilot, and full-scale treatment equipment. The RCRA Part A Permit Application for this unit was procedurally closed on December 12, 1996.
Location: The unit was located in various laboratories throughout the 324, 325 and 331 Buildings.
Related Sites/Structures: Structures related to these treatment facilities included the 300 Area Process Sewer, similar laboratories in the other buildings, and the remaining laboratories in each building.
Process Description: Various technologies were used to treat radioactive mixed waste and hazardous waste via biological treatment research and development processes. These technologies treated radioactive mixed waste and hazardous waste constituents in soil, effluents, and groundwater through the use of microorganisms (naturally present or organisms that were environmentally enhanced) to treat various chemical constituents, such as organics, nitrates, chromium, and cyanide. Biological treatment processes were capable of treating up to a maximum of 151, 400 liters (40,000 gallons).

Waste Type: Stormwater Runoff
Waste Description: Wastes treated by the unit included listed waste, waste from non-specific sources, characteristic wastes, and state-only wastes.

Closure Info: The RCRA Part A Permit Application for this unit was closed on December 12, 1996. Therefore, the WIDS site was reclassified to Closed Out.

Code: CWC
Type: Storage
Status: Active
Description: The Central Waste Complex consists of the 2401-W Storage Building, 23 low-flash-point mixed waste storage modules, the twelve 2402-W series storage buildings, a mixed waste storage pad, the 2403-W mixed waste storage buildings, and the waste receiving and staging area. The 2401-W, 2402-W, and 2403-W Storage Buildings are pre-engineered steel structures.
Process Description: The unit provides safe storage for mixed waste until burial in disposal units at the Hanford Site, or shipment to a Transuranic Waste Disposal Site.

Waste Type: Chemicals

Waste Description: The unit receives and stores designated mixed waste.

Related Sites/Structures: The Central Waste Complex is associated with the Waste Receiving and Packaging Facility (WRAP).

Process Description: The facility included the Transportable Grout Equipment and an underground feed pipeline from the 241-AP-102 tank. The fenced area previously known as the Grout Treatment Facility has been transitioned to the construction contractor that will build the new Waste Treatment Facility (vitrification plant). The head end of the 216-A-29 ditch was located within this fenced area. The ditch has been backfilled and stabilized.

Location: The Grout Treatment Facility was located east of the 241-AP Tank Farm, east of the 200 East Area. It is west of the Grout Treatment Facility Landfill area.

Related Sites/Structures: The Grout Treatment Facility was associated with the Dry Materials Receiving and Handling Facility, the AP-Tank Farm and the Grout Treatment Facility Landfill (Near Surface Disposal Facility).

Process Description: The Grout Treatment Facility was put on long term standby and the project was later cancelled. The feed transfer system was disconnected from the 241-AP-102 Tank. The High Efficiency Particulate Air filters were removed from the Liquid Collection Tank/Mixer Module (Transportable Grout Equipment) ventilation system. This reduced the level of contamination in the facility. A failed mixer pump in Tank 241-AP-102 was removed in 1995. The Grout Treatment Facility was to be used as an emergency option in the event that tank space is not available to resolve tank safety issues. During operations, the waste was stored in Tank 241-AP-104 and pumped to the Grout Feed Tank 241-AP-102. The dry materials (from the Dry Materials Receiving and Handling Facility) were trucked to the Transportable Grout Equipment. The Transportable Grout Equipment mixed the dry blend with liquid additives and aqueous waste to form a cementitious slurry. The slurry was pumped to a below grade vault located in the Grout Treatment Facility Landfill, where it hardened. Excess water from the vaults and flush solutions from the Transportable Grout Equipment were pumped to feed Tank 241-AP-102 or other tanks in the tank farms.

Waste Type: Stormwater Runoff

Waste Description: The liquid waste at this facility had low concentrations of radioactive and other hazardous materials. The facility had the capacity to treat 101,000 gallons (382,285 liters) per day.

<tr>
<th><strong>Type:</strong> Burial Ground</th>
<th><strong>Start Date:</strong> 1/1/1986</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Status:</strong> Inactive</td>
<td><strong>End Date:</strong> 1/1/1991</td>
</tr>
<tr>
<td><strong>Description:</strong> The Grout Treatment Facility Landfill had been located within a fenced area, now designated for construction of the Waste Treatment Plant (vitrification plant). Access is currently controlled by the construction contractor. Five underground vaults were constructed of reinforced concrete with cover blocks to support the Grout Treatment facility. The vault floors are sloped toward a leachate collection trench. The site consists of five rectangular vaults known as 101, 102, 103, 104, and 105.</td>
<td></td>
</tr>
<tr>
<td><strong>Location:</strong> The Grout Treatment Facility Landfill is located east of the 200 East Area fence. It was located inside the fence that currently surrounds the Waste Treatment Facility construction site. The landfill is east of the area formerly known as the Grout Treatment Facility. The vaults are located in the western portion of the Grout Treatment Facility Landfill.</td>
<td></td>
</tr>
<tr>
<td><strong>Related Sites/Structures:</strong> The vaults are associated with the Grout Treatment Facility.</td>
<td></td>
</tr>
<tr>
<td><strong>Process Description:</strong> The vaults at the Grout Treatment Facility Landfill received liquid grout slurry from the Transportable Grout Equipment. The liquid feed contained low activity (8.4E-5 curies per liter) phosphate-sulfate waste. The grout slurry hardened in the vaults. The excess liquid was pumped back to the feed tank (241-AP-102 or another tank at the tank farms). After the excess water was removed, the void space between the grout surface and vault roof was filled with nonradioactive grout.</td>
<td></td>
</tr>
<tr>
<td><strong>Waste Type:</strong> Water</td>
<td></td>
</tr>
<tr>
<td><strong>Waste Description:</strong> As of 1992, the Grout Treatment Facility Landfill Vaults had a total capacity of approximately 185 acre feet (228,200 cubic meters). The waste feed had low concentrations of radionuclides and hazardous materials.</td>

Facilities

Type: Laboratory
Start Date: 1/1/1979
Status: Inactive
End Date: 1/1/1995

Description: The unit consisted of the use of the 324 Building Biological Treatment Test Facilities, the 324 Building Radiochemical Hot-Cell Complex, and the 325 Building Shielded Analytical Laboratory to test treatment technologies for radioactive mixed waste and hazardous waste. The processing equipment covered under this unit included lab and bench-scale treatment equipment. The RCRA Part A Permit Application for this unit was procedurally closed on May 13, 1996.

Location: The unit was located in various laboratories in the 324 and 325 Buildings.

Related Sites/Structures: Structures related to these treatment facilities included the 300 Area Process Sewer, and laboratories in the 324 and 325 Buildings.

Process Description: Treatment processes are usually small, bench-scale operations. The processes included pH adjustment, ion exchange for selective removal of contaminants from waste solution, waste concentration by evaporation, waste dissolution such as waste retrieval from storage tanks by pH adjustment or fusion, precipitation/filtration and solvent extraction from solutions, slurries, and sludges, solids washing for separation of contaminants from sludges, catalytic destruction methods, e.g., electrolytic generation of oxidants such as silver, cerium, and other electrochemically enhanced processes for decontaminating metals and oxidizing non-metals, and grouting. Most treatment processes were small, bench-scale operations.

Waste Type: Chemicals

Waste Description: Waste treated by various processes included listed wastes, wastes from non-specific sources, characteristic wastes, and state-only wastes. Petroleum refining wastes were also included. The processes used in this unit included pH adjustment, ion exchange processes, waste concentration, precipitation/filtering, solids washing, catalytic destruction, and grouting.

Closure Info: The RCRA Part A Permit Application for this unit was closed on May 13, 1996. Therefore, the WIDS site was reclassified to Closed Out.

Code: SHLWSTS
Classification: Accepted
Names: SHLWSTS; Simulated High-Level Waste Slurry Treatment/Storage
Reclassification: Closed Out (9/6/1995)
Type: Process Unit/Plant
Start Date: 1/1/1987
Status: Inactive
End Date: 1/1/1995

Description: The site has been cleaned and turned over to the Port of Benton. This site was three roped off areas within the fenced-in 1234 Storage Yard. The site consisted of a treatment area, a storage area, and a less than 90 day accumulation area. The RCRA TSD was clean closed September 6, 1995.

Location: This site is located within the 1234 Storage Yard which is southwest of the intersection of Stone Street and "W" Avenue. It is south of the 300 Area, east of Stevens Dr.

Related Sites/Structures: The associated structure is the 1234 Storage Yard.

Process Description: This site was used to store containerized simulated high-level waste slurry. The slurry was treated at this site in a grout/stabilization process. The slurry treatment program was initiated on September 13, 1988 and ended on October 28, 1988. The treatment process consisted of
neutralization and mixing with grout within lined 55-gallon containers. The treatment eliminated the characteristics of ignitability, corrosivity and EP Toxicity. The grouted slurry was stored in drums at the site of treatment until tests (EP Toxicity, Acute Fish and Rat Toxicity) were completed. These tests verified that the treated waste exhibited no dangerous waste characteristics.

**Waste Type:** Chemicals

**Waste Description:** The 90-day pad stored waste from various Battelle research activities including the slurry treatment wastes.

**Waste Type:** Chemicals

**Waste Description:** The slurry was dangerous waste containing toxic constituents and dissolved metals. The treated slurry was managed as non-radioactive solid waste.

---

**Code:** TFS OF 218-E-4  
**Classification:** Accepted

**Names:** TFS OF 218-E-4; Tile Field South of 218-E-4; 2607-E3 Tile Field  
**Reclassification:** Consolidated (4/12/2004)

**Type:** Drain/Tile Field  
**Start Date:** 1/1/1944  
**End Date:** 1/1/1997

**Status:** Inactive  
**Description:** The tile field south of 218-E Burial Ground is comprised of vitrified clay pipe and drain tile. The laterals of the tile field are open jointed and are spaced 7.9 feet (2.4 meters) apart.

**Location:** This tile field is located southwest of the 218-E-4 Burial Ground and north of the 2607-E3 Septic Tank.

**Related Sites/Structures:** This tile field is associated with the 2607-E3 Septic Tank and received sanitary wastewater and sewage from B-Plant Facilities.

**Process Description:** The tile field was designed to percolate wastewater into the ground without exposing it to the open air. The 2607-E3 Septic Tank was abandoned in place in 1997.

**Waste Type:** Process Effluent

**Waste Description:** The 2607-E3 Septic Tank has received approximately 5.45 cubic meters (3,800 gallons) of sanitary wastewater and sewage per day from the B Plant Aggregate Area Facilities. The waste is discharged to the tile field located north of the 2706-E3 and South of the 218-E-4 Burial Ground.

**This Site Was Consolidated With:**

**Code:** 2607-E3

**Names:** 2607-E3; 2607-E3 Septic System; 2607-E3 Septic Tank and Drainfield; TFS of 218-E-4; Tile Field South of 218-E-4

---

**Code:** TRUSAF  
**Classification:** Accepted

**Names:** TRUSAF; 224-T TRUSAF; Transuranic Assay Facility  
**Reclassification:** None

**Type:** Storage  
**Start Date:** 1/1/1985  
**End Date:** 1/1/1997

**Status:** Inactive  
**Description:** The building is a RCRA compliant storage unit occupying 2/3 of the 224-T building and adjacent outdoor areas. One third of the building (224-T Canyon) was sealed off in 1975. The
storage capacity is 2,000 (55-gallon) drums (110,000 gallons). Access to the building is restricted with a locked, chain link fence.

**Location:**
This is a three story concrete building located southeast of 221-T and south of 222-T.

**Related Sites/Structures:**
The TRUSAF activities are associated with waste management operations.

**Process Description:**
The building was originally constructed in 1943 as part of the T Plant bismuth-phosphate fuel processing complex. From 1944 to 1956 it functioned as the Plutonium Concentration Facility. Six radiologically contaminated process cells are located in the eastern 1/3 of the building. The cells were sealed off from the rest of the building in 1975. The amount of radiological or regulated material remaining within the process cells is unknown. This section of the building is documented in WIDS Sitecode 224-T. The TRUSAF process included the exterior inspection of waste drums, neutron assay of waste containers to determine the isotope content and an X-ray examination of the waste containers to confirm the absence of prohibited contents (e.g. free liquids). After examination the containers were stored on the second and third floors, in rows (following a pattern marked on the floor) or in storage modules. All TRUSAF waste was removed from the 224-T building in August 1997. The building is on standby. No operations are currently taking place in 224-T except for routine building surveillance.

**Waste Type:** Chemicals

**Waste Description:** The TRUSAF facility operation consisted of a nondestructive analysis of TRU waste. The hazardous waste that may be allowed into this facility could be any of the listed or characteristic wastes as defined by RCRA and Washington Administrative Code 173-303. The waste was generated by DOE processing facilities and will eventually be shipped to the WIPP in New Mexico for disposal. Prior to placing the building on standby, all of the waste was removed from 224-T.

---

**Code:** TTTF

**Classification:** Accepted

**Names:** TTTF; Thermal Treatment Test Facilities

**Reclassification:** Closed Out (5/13/1996)

**Type:** Laboratory

**Start Date:** 1/1/1978

**End Date:** 1/1/1996

**Description:** The process and equipment consisted of various laboratories inside the 324 and 325 Buildings and the in-situ vitrification (ISV) unit, which was a transportable treatment unit. The processing equipment covered under this unit included bench, engineering, pilot, and full-scale treatment equipment. The RCRA Part A Permit Application was administratively closed on May 13, 1996.

**Location:** The unit was located inside various labs throughout the 324 and 325 Buildings. The in-situ unit was able to be transported across the Hanford Site.

**Related Sites/Structures:** Structures related to these treatment facilities included the 300 Area Process Sewer, engineering development laboratory (EDL), EDL high bay and hot cell complex of the 324 Building. Additionally, the in-situ treatment unit had ancillary structures providing power, filtration and control. The 116-B-6A Crib was used for testing as were other laboratories located in the 324, 325 and 331 Buildings.

**Process Description:** These units treated mixed and hazardous waste with in-situ vitrification or waste vitrification treatment processes. The equipment and processes were used to treat the waste included bench, pilot, engineering, and full-scale treatment equipment.

ISV was a thermal treatment process that converted contaminated soils and sludges into a glass and crystalline product. An electrical current was passed among an array of four electrodes
imbedded in the contaminated soil or sludge, melting and glassifying it. The process continued outward and downward until the appropriate vitrification depth was obtained. Radioactive mixed waste and dangerous waste constituents were stabilized in the glass and crystalline product. Organic contaminants were destroyed by pyrolysis, and the pyrolysis products oxidized as they migrated to the surface. PNL operated four treatability testing units (bench, engineering, pilot, and large-scale). The engineering and bench-scale units were located in the 324 Building in the 300 Area. The pilot and large-scale units were transportable within the Hanford Site. The design capacity of the units varied from 18.9 liters (5 gallons) per day (bench-scale) to 64345 liters (17,000 gallons) per day (large-scale).

Waste vitrification prototype equipment was located in the 324 Building. Treatability studies were performed using simulated and actual radioactive mixed waste samples. Radioactive mixed waste was mixed with glass-forming materials and vitrified into a highly durable glass for disposal. The design capacity ranged from 5.7 liters (1.5 gallons) per day (bench-scale) to 113.6 liters (30 gallons) per day (pilot-scale).

In some treatability studies with ISV, vitrified soil was left in place for additional study before either being removed or designated as nonhazardous.

Other thermal treatment processes covered by this permit included plasma arc pyrolysis, in situ heating of soils and sludges for removal of organics, metal melting for volume reduction and immobilization of contaminated metals, gamma induced oxidation of organic chemicals, thermal treatment for the drying and decomposition of liquid slurries, in can melting of soil wastes and liquid slurries, and microwave heating to dry and immobilize liquid and solid wastes.

Waste Type: Process Effluent
Waste Description: Wastes treated by these processes included listed wastes, wastes from non-specific sources, characteristic wastes, and state-only wastes. In-situ vitrification is a thermal process that converts contaminated soil and sludges into a glass and crystalline product. Non-volatilized contaminants are immobilized in the glass and crystalline product. Volatilized contaminants are recovered in a filtration system. Other vitrification processes explored in these units included plasma arc pyrolysis, melters, and gamma-induced oxidation.

Closure Info: This RCRA process was Administratively Closed Out with appropriate Part A forms. Therefore, the WIDS site was reclassified to Closed Out.

Code: UPR-100-N-15
Names: UPR-100-N-15; 108-N Neutralization Sump Spill; Acid Spill at 108-N; UN-100-N-15; UN-116-N-15
Type: Unplanned Release
Status: Inactive
Description: The release site is concrete structures and a graveled field. There is no evidence of the spill at the site.
Location: The release occurred at the 108-N Sump. The volume of contaminated soil was less than 1.4 cubic meters (50 cubic feet).
Release Description: On March 20, 1981, during the 8-4 shift, while sulfuric acid was being transferred from the 108-N storage tanks to the 163-N day tanks, a leak developed in a connection in the discharge line from the acid transfer pumps. The operator noticed the leak spraying across the interior of the 108-N building, but knowing the piping of the 108-N building to be prone to leaks over the past several years, he continued to fill the 163-N day tanks (10-15 minutes) until the desired level
was reached in accordance with procedure. After the tanks were filled, the operator shut the system down and notified his supervisor of the problems. The pressure in the leaking line during the transfer operation resulted in spraying a large portion of the interior of the 108-N building with highly corrosive sulfuric acid. The operator wore adequate protective clothing and received no injuries. The building interior sustained considerable acid damage. After supervision was notified, cleanup of the 108-N building began. The interior of the building was hosed down with water and drained to the 108-N neutralizing sump. When this sump became filled to capacity, it became necessary to transfer the neutralized mixture to another neutralizing pit. During this transfer a "water leak" was observed coming from the ground outside of the 108-N building. Following pH tests, the leak was traced to the discharge line from the 108-N neutralizing sump. During the transfer of the liquid, the outside of the 108-N building became flooded and was roped off. The Environmental Control Subsection was notified of the spill; and upon their recommendation, the surface leakage was neutralized with soda ash. No further actions were deemed necessary at that time. On March 23, 1981, during the 8-4 shift, Rockwell cement finishers reported to an N Plant Maintenance Analyst requesting permission to enter the 108-N building to clean the area around the base of the two acid transfer pumps to prepare the base for a new surfacing. Since no "hands on maintenance of any equipment" was required, the N Plant Maintenance Analyst saw no need for the preparation of a formal work authorization form. The Maintenance Analyst left the cement finishers at the job site and returned to his office. The cement finishers dressed in protective clothing and went about their assigned task. While scraping the surface of loose debris, the Rockwell cement finishers struck and broke off a small drain pipe coming off the suction header of the acid transfer pumps. Residual acid from the previously isolated line sprayed out on the interior of the 108-N building. Both cement finishers, dressed in appropriate protective clothing, were uninjured. Subsequent cleanup operations similar to those performed on 3/20/1981, again forced the usage of the transfer line from the 108-N neutralizing sump. The Environmental Control Subsection was notified prior to the transfer. They advised similar precautions be taken as those on 3/20/1981. Residual liquid on the ground outside of the 108-N was neutralized with soda ash.

Related Sites/Structures: This release is associated with the 108-N Chemical Unloading Facility.

Waste Type: Barrels/Drums/Buckets/Cans
Waste Description: The release consisted of sulfuric acid.

**Type:** Unplanned Release  
**Status:** Inactive  
**Description:** The release occurred in a concrete trench in a graveled lot. There is no evidence of the spill at the site.

**Location:** The release occurred at the southwest corner of the 120-N-5, 108-N/163-N Transfer Line And Neutralization Pit.

**Release Description:** Washington Public Power Supply System (WPPSS) supervision called the 105-N Control Room and reported a large cloud of steam in the vicinity of the WPPSS trestle. An investigation revealed liquid spurt ing several feet into the air from a sulfuric acid and sodium hydroxide line encasement at the encasement sump. The weekly sulfuric acid transfer from 108-N to 163-N was in process. It was subsequently determined that the sulfuric acid had been transferred from the storage tank at 108-N, and none had been received at the 163-N Storage Tank. Approximately 12,870 liters (3,400 gallons) of 94% sulfuric acid was released to the ground. Contamination was limited to the region near the sulfuric acid transfer line in the vicinity of the sump. The release occurred on May 12, 1980. While the CMS reports a spill of 3,800 liters (1,000 gallons), historical records [e.g., Stenner et al. 1988] lists a release of 12,870 liters (3,400 gallons).

**Waste Type:** Barrels/Drums/Buckets/Cans  
**Waste Description:** The release was a solution containing 94% sulfuric acid.

**Type:** Unplanned Release  
**Status:** Inactive  
**Description:** The site is level and graveled. A pipe is present that carried sodium hydroxide from the tankers to the 1310-N Facility (116-N-2). The site is located in a radiation zone, but the sodium hydroxide should not have been radioactively contaminated. The 116-N-2 Facility complex consists of piping, pumps, a transfer tank (commonly referred to as the silo) and a large, spherical storage tank (commonly referred to as the golf ball). The site was used as a collection tank for N Reactor primary piping decontamination wastes. The 3.4E+06-liter (9.0E+05-gallon) spherical tank is partially buried in the ground. A compacted soil radiation barrier, 7.6 meters (25 feet) high, borders the tank on three sides.

**Location:** The spill occurred in the 100-N Area, west northwest of 1310-N.
**Process Description:** The sodium hydroxide was used to neutralize the radioactively contaminated and hazardous decontamination solution pumped from the N Reactor to the 116-N-2 (1310-N Facility).

**Related Sites/Structures:** The 116-N-2 (1310-N Chemical Waste Treatment and Storage Facility) is associated with the site.

**Waste Type:** Chemicals

**Waste Description:** Three hundred eighty liters, (100 gallons) of sodium hydroxide was spilled to the ground during offloading operations in a radiation zone.

</table>
**Release Description:** A spill of acidic wastewater (pH 1.1) from the 163-N Demineralized Water Treatment Plant occurred on June 30, 1986. The spill happened when a temporary 15-centimeter (6-inch) hose became dislodged for approximately 4 minutes during a discharge cycle, spilling approximately 3,800 liters (1000 gallons) of the liquid. The corrective action was to add 82 kilograms (180 pounds) of soda ash to the spill to neutralize the acid. Subsequent pH of the spill was 10.1 standard units. No cleanup action is mentioned in the occurrence report.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** The liquid released was regeneration waste consisting of sulfuric acid from ion exchange columns in the 163-H Facility. Soda ash was added to the spill to help neutralize the liquid.

<td></td>
</tr>
<tr>
<td>Release Description:</td>
<td>On March 20, 1951, a cascade outlet became plugged, contaminating the soil near the 241-BX-102 Tank. Approximately 348,000 liters (91,600 gallons) of metal waste was released.</td>
<td></td>
</tr>
</tbody>
</table>
**Process Description:**
In 1951, this tank was receiving the "metal waste" stream from the Bismuth Phosphate plutonium separation process at B Plant. The metal waste stream was the first waste stream discharged after the fuel rod dissolution. It was a large volume waste stream that contained high concentrations of uranium and 90 percent of the radionuclides originally present in the irradiated fuel rods.

**Waste Type:** Steam Condensate

**Waste Description:** The waste stream involved with this release was the Bismuth Phosphate process metal waste stream. It typically contained approximately 0.5 pound of uranium per gallon of liquid waste. The waste released contained approximately 20.4 metric tons (22.5 tons) of depleted uranium.

  - **Description:** WIDS site UPR-200-E-13 has been reclassified based on documentation that verified it was a DUPLICATE of UPR-200-E-15. Future updates and closeout information will only be added to UPR-200-E-15. This site will no longer be updated. The unplanned release contaminated both the soil and blacktop areas between the 291-A Turbine House and the 216-A-4 Crib. The release site was not separately marked or posted.

---

*Hanford Site Waste Management Units Report*

February 2015
**Location:** The release occurred south of PUREX, between the 216-A-4 Crib and the 291-A Turbine House.

**Release Description:** In December 1958, the 216-A-4 Crib became plugged during the jetting of the 216-A-2 Catch Tank which resulted in contaminated material backing into the 291-A Turbine House through the floor drains. The floor was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). In addition, an area of ground and blacktop outside the turbine house was contaminated up to 8 rads/hour.

**Waste Type:** Steam Condensate

**Waste Description:** The 216-A-4 crib plugged during the jetting of the 216-A-2 catch tank. Contaminated liquid backed up into the 291-A Turbine House floor drains. The floor of the Turbine House was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). The liquid effected an area of ground and blacktop outside the turbine house that was contaminated with beta/gamma levels up to 8 rads/hour.

**This Site Was Consolidated With:**

**Code:** 200-E-103

**Names:** 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

**Code:** UPR-200-E-14

**Names:** UPR-200-E-14; 216-B-3 Pond Dike Break; UN-200-E-14

**Type:** Unplanned Release

**Status:** Inactive

**Start Date:** 1/1/1958

**End Date:** 1/1/1958

**Description:** The site is an unplanned release that occurred as a result of a dike break in 216-B-3 Pond. In 1983, the 216-B-3A Pond lobe was built over the top of this release site. There is no visible evidence of this release. It is not physically marked or posted. There is a large percolation trench in the center of the 216-B-3A pond that is posted as a Soil Contamination Area. However, the percolation trench was dug in 1984 and this Unplanned Release occurred in 1958. This site has been consolidated with 216-B-3B RAD.

**Location:** The release site was located east of the 200 East Area perimeter fence. The release occurred on the east side of the 216-B-3 Main Pond.

**Release Description:** A break in the dike at 216-B-3 Pond in 1958 caused ground contamination in a ravine east of the pond. The "A" lobe of 216-B-3 Pond was built in 1983, over the top of the area where this release occurred. The release site was probably removed when the pond lobe was dug out.

**Related Sites/Structures:** The release is associated with 216-B-3 Pond and 216-B-3A lobe.

**Waste Type:** Steam Condensate

**Waste Description:** A dike break had the potential to carry material from any of the sources listed here. Waste streams flowed from the 216-A-29 and 216-B-3-3 Ditches into the 216-B-3 Pond. Discharges to 216-B-3 via 216-B-3-3 included: 221-B Building steam condensate and process cooling water; 284-E Powerhouse water; 244-CR Vault cooling water; 244-AR Vault and 242-A Evaporator cooling water; 202-A process cooling water, condenser cooling water, and air sampler vacuum pumps seal cooling water; 241-BY Tank Farm condenser cooling water; and Waste Encapsulation Storage Facility cooling water. Discharges to 216-B-3 via 216-A-29.
included 202-A chemical sewer and acid fractionator condensate. The main pond received corrosive and toxic dangerous waste from two primary sources: the regeneration of the Plutonium Uranium Extraction (PUREX) plant demineralizer columns and from spills of dangerous or mixed waste from PUREX. The spills included hydrazine, cadmium nitrate, and ammonium fluoride/ammonium nitrate. The backwash from the regeneration of the demineralizer columns included nitric acid, sulphuric acid, sodium hydroxide, and potassium hydroxide.

<tr>
<td>UPR-200-E-24</td>
<td>Accepted</td>
<td>The release is associated with the burial of contaminated PUREX equipment. This release is also associated with UPR-200-E-24.</td>
</tr>
</tbody>
</table>

Related Sites/Structures:
The release is associated with the burial of contaminated PUREX equipment. This release is also associated with UPR-200-E-24.

Process Description: Large boxes of contaminated equipment were routinely transported to solid waste burial grounds on railroad flat cars. The 200 East Area Waste Burial Ground logbook states that two PUREX concentrator tube bundles, contained in a wooden burial box measuring 6.1 by 3.3 meters (20 by 11 feet), were buried in Trench #1 of 200 East Burial Ground 10, at coordinates N45058/W54765 (Hanford Plant coordinates). The maximum dose rate recorded on the box during burial was 5 rad per hour at a distance of 30 meters (100 feet). The box was covered with dirt, but not completely backfilled on June 10, 1960.

Waste Type: Sanitary Sewage
Waste Description: The contamination originated from PUREX process tube bundles (from F-11 and H-4). Radiological readings ranged from a maximum of 60 millirad/hour beta/gamma at the burial ground to approximately 1,000 counts/minute outside the 200 East Area fence.

The release is associated with the burial of contaminated PUREX equipment. This release is also associated with UPR-200-E-24.

Process Description: Large boxes of contaminated equipment were routinely transported to solid waste burial grounds on railroad flat cars. The 200 East Area Waste Burial Ground logbook states that two PUREX concentrator tube bundles, contained in a wooden burial box measuring 6.1 by 3.3 meters (20 by 11 feet), were buried in Trench #1 of 200 East Burial Ground 10, at coordinates N45058/W54765 (Hanford Plant coordinates). The maximum dose rate recorded on the box during burial was 5 rad per hour at a distance of 30 meters (100 feet). The box was covered with dirt, but not completely backfilled on June 10, 1960.

Waste Type: Sanitary Sewage
Waste Description: The contamination originated from PUREX process tube bundles (from F-11 and H-4). Radiological readings ranged from a maximum of 60 millirad/hour beta/gamma at the burial ground to approximately 1,000 counts/minute outside the 200 East Area fence.

**Description:** The contaminated area is not currently marked or posted.

**Location:** Contamination spread from the 200 East Burial Ground (218-E-10) to as far as 3 miles (4.83 kilometers) beyond the 200 East Area perimeter fence.

**Release Description:** On Friday, June 10, 1960, a burial box containing two PUREX process steam tube bundles was placed in the 218-E-10 Burial Ground. It was covered with dirt, but not completely backfilled. Over the weekend, the box collapsed, causing a contamination spread. On Monday, June 13th, the burial ground was found to be contaminated with radiological levels ranging from 10 to 60 millirads/hour. It was also determined that wind had carried the contamination southeast across the 200 East Area to mile post 7 on Highway 4-S. Contamination levels beyond the 200 East area fence were approximately 1000 counts per minute. Two private vehicles were decontaminated that had been located in the PUREX parking lot. The incident was investigated and reported as Radiation Exposure Occurrence Type C, CPD 60-1. The date of the incident is probably June 10, 1960 instead of the June 17, 1960 as reported in PNL-6456. However, it is likely that the distant contamination (identified at mile marker 7 southeast of 200 East Area) was not documented until June 17th.

**Related Sites/Structures:** This site is associated with UPR-200-E-23.

**Process Description:** Large boxes of contaminated equipment were routinely transported to solid waste burial grounds on railroad flat cars.

**Waste Type:** Sanitary Sewage

**Waste Description:** The release was caused from a burial box containing PUREX tube bundles. The average radiation level on the soil surfaces inside the burial ground fence was 30 millirads/hour at 10.16 centimeters (4 inches). The contamination diminished as it traveled from the burial site. Less than one particle of contamination per 9 square meters (100 square feet) was found outside the 200 East Area perimeter fence.

### This Site Was Consolidated With:

- **Names:** 218-E-10; Equipment Burial Ground #10; 200 East Industrial Waste No. 10

---

**Code:** UPR-200-E-25

**Names:** UPR-200-E-25; Contamination Spread from the 241-A-151 Diversion Box; UN-200-E-25

**Type:** Unplanned Release

**Start Date:** 1/1/1960

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Consolidated (12/7/2004)

**Description:** The area south of PUREX, inside the facility fence had been posted as a Contamination Area. In 1999, the large posted Contamination Area was covered with clean backfill and changed to an Underground Radioactive Material Area (200-E-103). It is possible this release contributed to the contamination in the area. The release is not separately marked or posted, but is documented on a sign hung on the PUREX south perimeter fence.

**Location:** The area of contamination extended southwest of PUREX, as far as 61 meters (200 feet) beyond the 200 East Area fence.
**Release Description:** On September 5, 1960, steam released from the 241-A-151 Diversion Box during jumper testing contaminated an area southwest of PUREX. A plume of contaminated particles extended 200 feet (61 meters) beyond the 200 East Area fence. The average ground deposition was approximately five particles per 9.3 square meters (100 square feet). The maximum contamination level per particle was 100,000 counts per minute. Seven of ten Hanford Site buses, parked at the 200 East Area Badge House, were contaminated on the outside. No private vehicles were involved.

**Related Sites/Structures:** The site is associated with 241-A-151 and 200-E-103.

**Waste Type:** Stormwater Runoff

**Waste Description:** Steam rising from the diversion box caused a spread of beta/gamma (specks) with readings up to 100,000 counts per minute per particle. The average ground deposition (specks) was approximately five particles per 9.3 square meters (100 square feet).

**This Site Was Consolidated With:**

**Code:** 200-E-103

**Names:** 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

---

**Code:** UPR-200-E-26

**Classification:** Accepted

**Reclassification:** Consolidated (12/7/2004)

**Type:** Unplanned Release

**Start Date:** 1/1/1960

**Status:** Inactive

**End Date:**

**Description:** The area south of PUREX, inside the facility fence had been posted as a Contamination Area. In 1999, the large posted Contamination Area on the south side of PUREX was covered with clean backfill and changed to an Underground Radioactive Material Area (200-E-103). The release is not separately marked or posted, but is documented on a sign hung on the PUREX south perimeter fence. It is possible this release contributed to the contamination in the area.

**Location:** Contamination from this release spread southwest of the 241-A-151 Diversion Box, outside of the 200 East Area perimeter fence and across Route 4S.

**Release Description:** On September 30, 1960, a recently installed jumper was being tested. A gross leak was observed in the 241-A-151 Diversion Box causing an operator to stop test. However, the E-1 process tank emptied causing a cloud of steam to blow out of the faulty jumper connection, contaminating the area around the diversion box and beyond the PUREX fence. Beta/gamma readings ranged from 1 to 3 rad per hour near the diversion box. Just outside the PUREX exclusion fence, the general contamination decreased to 3,000 counts per minute. Contamination concentrations of approximately 5 particles per 9.3 square meters (100 square feet) were found as far away as the BC Crib Area. Several employees and government vehicles at the job site were contaminated.

**Related Sites/Structures:** The release is associated with the 241-A-151 Diversion Box and 200-E-103.

**Waste Type:** Chemicals

**Waste Description:** A cloud of contaminated steam escaped from a faulty connection inside the diversion box. Beta/gamma contamination (specks) with readings ranging from 1 to 3 millirads per hour were found near the diversion box. The general contamination levels on surfaces further away averaged 3,000 counts per minute. The waste line being tested was used for routing PUREX strontium interim storage to 244-CR vault.

**Description:** The release site, within the Tank Farm fenceline, is not specifically marked or posted.

**Location:** The release originated from the 244-CR Vault and spread eastward, contaminating the inside of the tank farm and also several hundred feet beyond the tank farm perimeter fence.

**Release Description:** On November 1, 1960, during work in the 244-CR Vault, winds spread contaminated particles eastward. Contamination levels around the vault, inside the fence, ranged between 50 and 100 millirads/hour. Particles reading as high as 40,000 counts per minute were found outside the fence. The original incident report says work was being done in a diversion box when the release occurred. The 241-CR-151 Diversion Box is adjacent to the 244-CR Vault.

**Waste Type:** Barrels/Drums/Buckets/Cans

**Waste Description:** Beta/gamma contamination (specks) with readings of 50 to 100 millirads/hour was found near the vault. Readings of particles on surfaces outside the tank farm fence area were up to 40,000 counts/minute.

**Description:** The burial ground has been surface stabilized. The burial ground is posted as Underground Radioactive Contamination.

**Location:** The release occurred within 218-E-10 site boundary. It is located in the northwest corner of 200-East Area, south of 12th Street.

**Release Description:** HW-69443 (document dated 5-22-61) states that on April 20, 1961 a wooden burial box, containing 83 highly contaminated process jumpers, collapsed as it was being covered over with soil in the burial trench. Contamination (maximum 500 millirad/hour) was spread over a 400,000 square foot area within the burial ground. The majority of the contamination was confined to the burial ground.

**Waste Type:** Sanitary Sewage

**Waste Description:** The release consisted of dried contamination from process jumper with readings up to 500 millirads/hour that were inside a wooden burial box.
This Site Was Consolidated With:
Code: 218-E-10
Names: 218-E-10; Equipment Burial Ground #10; 200 East Industrial Waste No. 10

Code: UPR-200-E-31
Names: UPR-200-E-31; 241-A-151 Release; UN-200-E-31
Type: Unplanned Release
Status: Inactive
Description: The area south of PUREX, inside the facility fence had been posted as a Contamination Area. In 1999, the large posted Contamination Area, located on the south side of PUREX, was covered with clean backfill and changed to an Underground Radioactive Material Area (200-E-103). The release is not separately marked or posted, but is documented on a sign hung on the PUREX south perimeter fence. It is possible this release contributed to the contamination in the area.
Location: In 1961, the contamination spread from the 241-A-151 Diversion box (located on the south side of 202-A), affected the PUREX exclusion area, areas northeast of PUREX and east of the 200 East Area fence.
Release Description: Several attempts were made to enter the 241-A-151 Diversion Box, (located on the south side of PUREX [202-A]) on October 7, 1961 during the 12 to 8 and the 8 to 4 shifts. Each attempt detected steam coming out of the diversion box when the cover block was being lifted. On those two shifts, the cover block was replaced and the job was canceled. On the 4 to 12 shift no steam was detected. The cover blocks were removed and the work inside the diversion box proceeded. After the work was completed, a radiological survey found 80,000 counts per minute on the blacktop on the north side of 202-A (the opposite side of the building from the diversion box) that triggered a radiological investigation. Smearable contamination of 80 millirem per hour was found on the PUREX roof. Contamination levels in the vicinity of the PUREX facility ranged from 40,000 to 100,000 counts per minute. Further surveys identified more contamination north of PUREX at 275-EA and east of Canton Avenue. Surveys of the Hanford environment continued through October 20,1961. Approximately 20 vehicles were found to be contaminated up to 40,000 counts per minute. Some low level contamination (2 particles per 100 square feet) was found as far away as the west bank of the Columbia River.
Related Sites/Structures:
The release is associated with the 241-A-151 Diversion Box and 200-E-103.

Process Description: The 241-A-151 Diversion Box provided routing for high level waste going from 202-A to the 200 East Area Tank Farms. Several leaks in the jumpers caused gross contamination inside the diversion box.
Waste Type: Oil
Waste Description: Steam rising from the 241-A-151 Diversion Box resulted in a spread of beta/gamma contamination (specks) with readings ranging from 40,000 to 100,000 counts per minute in the vicinity of PUREX. Readings on surfaces outside of the limited area fence decreased to 1,000 counts per minute. The diversion box provided routing for high level waste from the PUREX F and G cells to the tank farms.

Code: 200-E-103
Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Hanford Site Waste Management Units Report
February 2015
Reclassification: UPR-200-E-32; Coil Leak from 221-B; UN-200-E-32

Unplanned Release

Start Date: 1/1/1963

End Date: 1/1/1963

The site is an unplanned release that affected the 207-B Basin and the 216-B-2-1 Ditch. The unplanned release is not visually marked or posted. The 207-B Basin is labeled and posted as a Contamination Area. The 216-B-2-1 ditch is marked with AC-540 markers and is included within a larger Underground Radioactive Material area. This site has been consolidated with the 207-B Retention Basin.

Location: The release occurred at B-Plant and affected the 207-B Retention Basin and the 216-B-2-1 Ditch. The basin and the ditch are located inside the 200 East Area, east of Baltimore Ave. and south of 241-B Tank Farm.

Release Description: On November 7, 1963, a coil failed in the 221-B Building (6-1 Rare Earth Storage Tank) and caused a liquid release, contaminating the 207-B Retention Basin and the head end of the 216-B-2-1 Ditch. Document HW-79768 states the general dose rates ranged from 500 millirem per hour to 2 Rad per hour. Tumbleweeds driven into the contaminated ditch by high winds were found to be reading 50 rads per hour. The tumbleweeds were removed and transported to the burial grounds.

Related Sites/Structures: The release was related to B-Plant (221-B) 6-1 Tank inside 221-B. The pipeline from B Plant to the 207-B Basin is sitecode 200-E-112-PL.

Waste Type: Water

Waste Description: The B Plant 6-1 Rare Earth Storage Tank coil failed and cause a release to the retention basin and 216-B-1 ditch. A sample of the effluent released to the 207-B Retention Basin was analyzed in 1963. It was primarily Cerium-144 (30 curies) and .05 curies of strontium-90. Dose rates up to 500 millirad per hour were documented. Tumbleweeds that had blown into the ditch read up to 50 rad/hr.

This Site Was Consolidated With:

Code: 207-B
Names: 207-B; 207-B Retention Basin; B Plant Retention Basin
**Release Description:** On June 12, 1964, a coil leak in the F-15 Plutonium Uranium Extraction (PUREX) Tank contaminated 216-B-3 (B Pond) and 216-A-25 (Gable Mountain Pond). Approximately one fourth of the release was discharged to 216-B-3 Pond and the remaining three fourths of the contamination was released to 216-A-25 (Gable) Pond.

**Related Sites/Structures:** The release is associated with the PUREX facility, 216-A-25, 216-A-29 and 216-B-3.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** The ponds and ditch were contaminated with approximately 10,000 curies of mixed fission products from a coil leak in the PUREX F-15 tank. Water and biota samples found niobium-95, zirconium, yttrium, strontium-89, cerium-144, praseodymium-144, strontium-90 and cesium-137.

Type: Unplanned Release

Status: Inactive

Description: 241-B Tank Farm is enclosed with a chain link fence. The release is not separately marked or posted.

Location: The release occurred in the southwest corner of 241-B Tank Farm, adjacent to the 241-B-152 Diversion Box.

Release Description: A line, carrying 221-B cell drain waste, leaked causing a subsidence at the southeast corner of the 241-B-152 Diversion Box. Liquid was observed in the hole. Dose rate levels included 5 rad per hour at a distance of 10 meters (30 feet) and 30 millirem per hour at a distance of 45 meters (150 feet). Contamination spread in a northeast direction from the diversion box. Ground contamination levels ranged from 2,000 to 6,000 counts per minute at a distance of 183 meters (600 feet). Contamination levels decreased to background levels before reaching the 200 East Area perimeter road and fence.

Related Sites/Structures: The release is associated with the 241-B-152 Diversion Box.

Waste Type: Stormwater Runoff

Waste Description: Dose rates ranged from 5 rad per hour to 30 millirem per hour. Ground contamination readings ranged from 2,000 to 6,000 counts per minute. The waste came from the 221-B 9-2 tank and contained ruthenium and cerium.

This Site Was Consolidated With:

Code: 200-E-120

Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-40

Names: UPR-200-E-40; Release from the 216-A-36B Crib Sampler; UN-200-E-40

Type: Unplanned Release

Status: Inactive

Description: The site is an unplanned release. The site is not separately marked or posted. It has been consolidated with 200-E-103, because it is located within the boundaries of the larger site. 200-E-103 is a surface stabilized area that is posted Underground Radioactive Material.

Location: The release occurred on the ground and blacktop area outside the 216-A-36B Crib Sampler Shack (#295-A). The sample shack is located inside the PUREX Exclusion fence, south of 202-A, adjacent to the west side of the PUREX Storage Tunnel.

Release Description: On August 5, 1968, the valve to the vent line at the 216-A-36B Crib Sampling Shack was inadvertently left open. Liquid was noted spewing from the vent on the 216-A-36B Crib Sample Shack (295-A). The release contaminated approximately 4.65 square meters (50 square feet) of the blacktop outside the shack. The maximum contamination was 150 millirad/hour.

Related Sites/Structures: The site is associated with the 216-A-36B Crib, the 295-A Sample Shack, UPR-200-E-39 and the surface stabilized area known as 200-E-103.

Waste Type: Oil
## Soil Contamination in the Vicinity of R-13 Stairwell (221-B)

### Unplanned Release

**Location:**
The site is located in the vicinity of the R-13 stairwell on the south side of the 221-B Building.

**Release Description:**
This site was originally reclassified as Rejected. The reclassification form states that the site was reclassified because it is a duplicate of another site. The reclassification occurred before a Consolidated reclassification status was available. The reclassification status was administratively changed to Consolidated. The reclassification date was not changed.

Elevated dose rates were found inside a concrete electrical utility pit during a routine radiation monitoring survey on July 19, 1972. The maximum dose rate levels were up to 12.5 rad per hour, including 1.5 rad per hour of gamma. The release occurred in the ion exchange loading waste export line from tank 18-1 going to 241-BX Tank Farm via the 241-BX-154 diversion box. This waste line is located adjacent to the electrical utility pit. Contaminated waste seeped from the waste line and effected the electric utility pit.

**Waste Type:**
Process Effluent

**Waste Description:**
An estimated 30 curies of cesium-137 with readings of 12.5 rad per hour was released to the soil around the pipeline that carried tank 18-1 waste. Half of the cesium released was removed with the soil excavated to expose the line leak.

## Soil Contamination in the Vicinity of R-13 Stairwell (221-B)

### Unplanned Release

**Location:**
The contamination spread affected the parking lot east of the 702-A Building and ground surfaces inside the 241-A Tank Farm Complex.
### Release Description:

Contamination in the form of small white specks was detected in the 241-A Tank Farm on October 14, 1974. The specks covered an area approximately 30 meters (100 feet) by 76 meters (250 feet), extending in a northwesterly direction from the 702-A Vessel Ventilation Building. Contamination levels ranged from 30,000 counts per minute near the building to 1,000 counts per minute at the edge of the spread. It was assumed the material had come from the 702-A stack. The next day, a few specks were noticed in the parking area, east of the 702-A building. The contamination levels ranged from 500 to 2000 counts per minute. It is believed the specks had blown out of the tank farm onto the parking area. The contaminated soil was removed and the area was released for normal service.

### Related Sites/Structures:

The release is associated with the 702-A Vessel Ventilation Building.

### Process Description:

Six High Efficiency Particulate Air Filter (HEPA) units were connected in parallel to adequately filter the tank farm exhaust. An inspection of the filters following the incident indicated that the number one filter had failed. It was removed from service for repairs.

### Waste Type:

Stormwater Runoff

### Waste Description:

Beta/gamma contamination assumed to be particulates from the 702-A stack, with readings of 500 to 20,000 counts per minute, spread across the 241-A Tank Farm.

### Location:

The release affected the inside of the 241-A Tank Farm and the 241-A parking area.

### Release Description:

During the installation of a new pump at the 241-A-106 pump pit, wind caused contamination to spread, effecting the 241-A Tank Farm, several personnel, five vehicles and the 241-A Tank Farm parking area. Contamination levels ranged from 700 to 2000 counts per minute.

### Waste Type:

Stormwater Runoff

### Waste Description:

Wind caused contamination to spread during the installation of a new pump at the 241-A-106 tank. Contamination included beta/gamma readings ranging from 700 to 2,000 counts per minute.

**End Date:** 1/1/1975

**Description:** The sites of the release are not currently marked or posted.

**Location:** The two contaminated areas were on the roadway between the 241-AY Tank Farm and 218-E-12B Burial Ground.

**Release Description:** On February 7, 1975, a thermocouple well was removed from the 241-A-104 Storage Tank by pulling the well into a plastic tube as it was withdrawn from the tank. The contained well was placed on a flatbed truck for transportation to the burial ground. When leaving the Tank Farm gate, the plastic tube was ripped at the end closest to the front of the truck. At each of two downhill grades on the road, condensate in the plastic tube dripped out of the rip. Because the road was covered by 15 centimeters (6 inches) of snow, the driver thought the drips were probably melting snow. Upon arrival at the burial ground, the driver informed the foreman of the drips. A monitoring survey showed the release of contamination, which was limited to the snow cover and did not reach the roadway. The cleanup was begun that day and finished by noon on February 10, 1975.

**Waste Type:** Steam Condensate

**Waste Description:** The road was contaminated with beta/gamma with readings of 100,000 counts/minute while transporting a thermocouple from the 241-A-104 tank to the burial ground.

**Names:** UPR-200-E-51; Liquid Release from Purex to B-Pond; UN-200-E-51

**Type:** Unplanned Release

**Status:** Inactive

**Description:** The site is an unplanned release that discharged to 216-A-29 Ditch, 216-B-3-3 Ditch, and 216-B-3 Pond. There is no visual evidence of this release. It is not separately marked or posted. The 216-B-3 Pond, 216-A-29 Ditch and the 216-B-3-3 Ditch have all been backfilled and surface stabilized. They are posted Underground Radioactive Material areas. This site has been consolidated with the 216-A-29 Ditch.

**Location:** The incident involved a release to 216-B-3 Pond via the PUREX Building chemical sewer and the 216-B-3-3 Ditch. All of these waste units are located east of the 200 East Area perimeter fence.

**Release Description:** On May 15, 1977, a maximum of 15 kilograms (33 pounds) of cadmium as a nitrate solution was released from the PUREX storage tank, TK-324, to the chemical sewer (216-A-29 Ditch), 216-B-3-3 Ditch, and eventually released into the 216-B-3 Pond (B Pond). The incident occurred during an attempted transfer in the PUREX Building from storage tank TK-324 to storage tank TK-F18. A total of 61 drums that had previously contained cadmium nitrate were rinsed out and the solution was put in storage tank TK-324. TK-324 was discharged to the chemical sewer (216-A-29 Ditch). The cadmium nitrate solution was supposed to be transferred to TK-F18 for ultimate disposal to an underground storage tank, however, the Instrument Engineering Flow Diagram was not correct regarding the discharge routing from TK-324.

**Related Sites/Structures:** The release is associated with the PUREX facility, 216-B-3, 216-B-3-3 and 216-A-29.

**Waste Type:** Abandoned Chemicals

---

*Hanford Site Waste Management Units Report*  
February 2015  
2232
**Waste Description:** A cadmium nitrate solution containing 15 kilograms (33 pounds) of cadmium was released to the pond and ditch system. Water samples found levels of cadmium to be 5 times the drinking water standard.

**Code:** UPR-200-E-53  
**Classification:** Accepted  
**Reclassification:** Consolidated (5/6/2004)  
**Start Date:** 1/1/1978  
**End Date:**

**Description:** The burial ground is surrounded with concrete markers and Underground Radioactive Material signs. The release site is not marked or posted.

**Location:** The release occurred at the south end the 218-E-1 Burial Ground.

**Release Description:** On October 17, 1978, a contamination spread occurred during backfilling operations when shallow buried contaminated waste in an adjacent trench was uncovered by a bulldozer blade. Numerous spots of radioactive contamination were detected throughout an area of approximately 15.3 meters (50 feet) by 45.8 meters (150 feet) at the south end of the dry waste trench. A spot of contamination measuring up to 150 millirads/hour was also detected on the bulldozer which had been used during backfilling operations at the trench on October 12, 1978.

**Waste Type:** Chemicals  
**Waste Description:** Beta/gamma with readings to 150 millirads/hour were detected on the bulldozer blade after working in the 218-E-1 Burial Ground uncovered a portion of the buried waste. Contamination spots were detected in an area at the south end of the waste trench.

**Code:** UPR-200-E-58  
**Classification:** Accepted  
**Reclassification:** Rejected (7/28/2008)  
**Start Date:** 1/1/1980  
**End Date:**

**Description:** The release location is not currently marked or posted. The contaminated tumbleweeds were removed in 1980.

**Location:** A dirt roadway leading from 241-BX Tank Farm to the Dry Waste Burial Ground was contaminated. The location description is vague, but indicates the dirt road leading from the 241-BX tank farm to the 218-E-10 Burial Ground.

**Release Description:** On March 4, 1980, the Radiation Monitoring group, using a truck mounted road monitor, detected a high background on the dirt road to the Dry Waste Burial Ground from the 241-BX Tank Farm. A follow-up survey revealed bits and pieces of a crushed tumbleweed spread over about 22.9 meters (75 feet) of roadway. The maximum beta/gamma radiation was 100,000
counts per minute. No other contaminated weeds were found.

**Waste Type:** Steam Condensate

**Waste Description:** The maximum beta/gamma with reading on the tumbleweed fragments was 100,000 counts per minute.

<td></td>
</tr>
</tbody>
</table>

**Type:** Unplanned Release

**Status:** Inactive

**Description:** The 216-A-40 Retention Basin was backfilled and stabilized in 1994. It is surrounded with cement posts and Underground Radioactive Material signs. The contaminated mud nests were removed from the 244-AR Vault building.

**Location:** Contaminated mud was found in swallow nests at 244-AR Vault and contaminated tumbleweeds and mud were found outside the 216-A-40 Retention Basin bladder. The contamination source was determined to be the 216-A-40 Basin.

**Release Description:** On May 23, 1979, swallow nests, made of contaminated mud, were found attached to the outside of the 244-AR Vault building. It was determined that mud from the 216-A-40 retention basin was being used by the birds to build nests at the 244-AR Vault. Contaminated tumbleweeds and mud, with radiological readings up to 20,000 counts per minute, were found outside the containment bladder of the 216-A-40 retention basin. The cause of the contaminated mud was found to be water, from holes in the upper surface of the bladders, combined with dust blown into the basin that created mud. The holes were probably caused by environmental stresses, i.e. winter freeze.

**Related Sites/Structures:** The release is associated with the 216-A-40 Retention Basin and 244-AR Vault.

**Process Description:** The 216-A-40 Retention Basin was constructed with two 108,310-gallon rubber bladder type bags. They were used to contain contaminated cooling water and steam condensate from 244-AR Vault.

**Waste Type:** Steam Condensate

**Waste Description:** Contaminated mud containing cesium-137 and cobalt-60 with readings of 10,000 to 20,000 counts/minute was found on the outside of the 244-AR building and in the 216-A-40 basin. Mud collected from the top of the bladder contained 120 picocuries/gram of cesium-137 and 116 picocuries/gram of cobalt-60.

**Type:** Unplanned Release

**Status:** Inactive

**Description:** The 1981 release site was cleaned up immediately, and thus is not marked or posted. It is a paved roadway.
The release occurred north of PUREX. An area of blacktop roadway near Building 275-EA was contaminated.

The release occurred on June 3, 1981. The J. A. Jones Construction Company was excavating dirt from a crib near the 203-A Building. The excavated dirt was loaded into a truck for transport to the burial ground. The dirt was kept damp prior to loading to minimize dust and sheet plastic was used over the top of the truck bed load during transport. While transporting the load to the burial ground, the vehicle hit a bump and dirt spilled from the truck bed to the blacktop roadway near 275-EA. The driver stopped the vehicle, and Tank Farm Radiation Monitoring was contacted. A trail of dirt 0.3 to 0.6 meters (1 to 2 feet) wide and 12.2 meters (40 feet) long was noted on the roadway. General beta-gamma levels of 200 to 500 counts per minute (with one pebble to 3,000 counts per minute) were detected.

Radioactive contaminated soil, with beta/gamma readings from 200 to 500 counts per minute (with one pebble to 3,000 counts per minute), was spilled on the roadway while in route to the burial ground. The contaminated soil was removed from a crib near 203-A.

The site is located at the railroad right-of-way within the area mapped as the Industrial Burial Grounds (218-E-10). The site is an area of contamination found after a concrete burial box was off-loaded from railroad cars to the 200 East burial grounds. The box had left B-Plant with unacceptable levels of contamination that were not found until after the box had been off-loaded. Both the railroad car and the offloading ramp showed smearable contamination. The UPR was decontaminated within a few days after it was discovered.

Radioactive contamination was found on the drag-off ramp, the spacer cars and the flat car following the offloading and burial of contaminated B-Plant equipment and waste contained in a concrete burial box. The burial box had been transported to the burial ground on a flat car, with several spacer cars to shield the engine from dose rates. A survey of the spacer cars found smearable contamination levels of 10,000 to 40,000 counts per minute. Removable contamination up to 100,000 counts per minute was found on the flat bed car and the drag off ramp, and was decontaminated to background levels within 2 weeks.

The release is associated with the 200-E Industrial Burial Ground (218-E-10).

Contaminated equipment from B-Plant and PUREX canyon operations was often placed into concrete burial boxes and transported by railcar to the "drag-off ramp" at the 218-E-10 Burial Ground. The burial boxes had high dose rates and were remotely dragged off the flat bed rail cars by connecting long chains to Caterpillar tractors.

Contaminated particles from a B Plant burial box effected the drag-off ramp and several railcars. After it was discovered that the unloading ramp was contaminated to 100,000 counts per minute the ramp was decontaminated and brought back into use.

The site is located at the railroad right-of-way within the area mapped as the Industrial Burial Grounds (218-E-10).
per minute with beta/gamma, the site was decontaminated to background levels (within two weeks).

<td>General contamination was identified from 244-AR Vault to 241-C Tank Farm. The source was determined to be the 241-C-151 Diversion Box, located inside the C Tank Farm fence.</td>
<td></td>
</tr>
<tr>
<td>Release</td>
<td>On January 11, 1985, A Radiation Protection Technologist reported finding 2,000 counts per minute removable contamination in the vicinity of the 244-AR Vault. He asked for assistance to define the contamination boundaries. All available Radiation Protection personnel were directed to assist in characterizing the situation. PUREX, B-Plant and 241-A Tank Farm were determined not to be the source. The characterization efforts were complicated by the presence of low level contamination with a rapid decay that was determined to be radon from a prolonged weather inversion. The affected area was in the vicinity of the 241-C Tank Farm. Environmental samples and roadway and surface surveys indicated the 241-C-151 Diversion Box was the source of the contamination spread. Dose rates of 5 rad per hour were found on the cover blocks.</td>

The site is not separately marked or posted. The release site is located near the 241-B-151 Diversion Box, inside the 241-B Tank Farm. The diversion box is in the southwest corner of the 241-B Tank Farm.

The soil around the 241-B-151 Diversion Box was contaminated as a result of work activities in the diversion box in the fall of 1951 and again in the summer of 1952.

The release is associated with the 241-B-151 Diversion Box.

Approximately 10 curies of contamination was released from the 241-B-151 Diversion Box.

### Code: UPR-200-E-81  
**Classification:** Accepted  
**Reclassification:** Consolidated (6/13/2002)  
**Start Date:** 1/1/1969  
**End Date:** 1/1/1969  
**Description:** The release, inside the tank farm fenceline, is not separately marked or posted.  
**Location:** UPR-200-E-81 occurred in the waste transfer line near the 241-CR-151 Diversion Box, inside the 241-C Tank Farm.  
**Release Description:** On October 15, 1969, a puddle of contaminated liquid, measuring approximately 1.8 meters by 12.2 meters (6 feet by 40 feet), was discovered about a few feet west of the 241-CR-151 Diversion Box. The source of release was determined to be a leak in a underground transfer line from the PUREX facility (F-18 cell drainage line) to the 241-C-102 Waste Storage Tank, via the 241-CR-151 Diversion Box. When the leak was stopped, most of the liquid seeped into the soil. The contaminated area was covered with about 0.5 meters (18 inches) of backfill and clean gravel. A maximum dose rate of 5 rad per hour at distances of 6.1 meters (20 feet) was recorded.  
**Related Sites/Structures:** UPR-200-E-81 is associated with the 241-CR-151 Diversion Box, the 241-C-102 Tank, and the PUREX 202-A Building.  
**Process Description:** The original transfer line had a carbon steel segment between the 241-CR-151 diversion box and 241-C-102. The leak occurred at the welded connection between the carbon steel portion of the line and the stainless steel portion of the pipeline. The transfer line is now all stainless steel.  
**Waste Type:** Sludge  
**Waste Description:** Approximately 136,800 liters (36,000 gallons) of PUREX coating waste was released to the soil. The release included strontium-90 (360 curies), cesium-137 (720 curies), cerium-144 (360 curies), zirconium-95/niobium (1,080 curies), and ruthenium-103 (1,080 curies) at the time of release.

### Code: UPR-200-E-82  
**Classification:** Accepted  
**Reclassification:** Consolidated (6/13/2002)  
**Start Date:** 12/19/1969  
**End Date:** 12/19/1969  
**Description:** A large mound of shotcrete is currently on top of the area where the leak surfaced, inside the tank farm fence.
Location: UPR-200-E-82 occurred at the 241-C-152 Diversion Box (inside the tank farm) and flowed to the northeast, downgrade, until it pooled into an area outside the 241-C Tank Farm fence.

Release Description: On December 19, 1969, an underground waste line (V122) leak was discovered near the 241-C-152 Diversion Box. The source was determined to be the feed line (V122) that ran from 241-C-105 tank to the 221-B Building. Approximately 3800 liters (1000 gallons) of the total liquid released collected on the surface and was visually noticed by a Radiation Monitor. The liquid traveled downgrade, in a northeast direction, until it pooled into an area measuring approximately 0.46 square meter (5 square feet), outside the tank farm fence. The precise location of this area is not provided in the references.

Related Sites/Structures: UPR-200-E-82 was associated with the 241-C-152 Diversion Box, the 241-C-105 Tank, 200-E-116-PL and the 221-B Canyon Building.

Process Description: The feed for the B Plant cesium ion exchange process was pumped from the 241-C-105 (lag storage) tank through an underground pipeline and several diversion boxes, to the 221-B building.

Waste Type: Chemicals

Waste Description: The waste line leak consisted of B Plant Ion Exchange waste containing cesium-134 (100 curies), cesium-137 (11,300 curies), cerium-144 (260 curies), ruthenium-106 (130 curies) and zirconium-95/niobium (260 curies) at the time of release.

This Site Was Consolidated With:
Code: 200-E-133
Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-86
Names: UPR-200-E-86; 241-C Tank Farm Line (V812) Break Southwest Corner; UN-200-E-86; UN-216-E-14
Type: Unplanned Release
Status: Inactive
Start Date: 1/1/1971
End Date: 1/1/1971

Description: The site is an area covered with shotcrete, with concrete AC-540 marker posts at each corner. It is posted with Underground Radioactive Material signs.

Location: UPR-200-E-86 occurred near the southwest corner of the 241-C Tank Farm, outside the tank farm fence.

Release Description: On February 25, 1971, routine line (leak detection) monitoring equipment detected a leak in the vicinity of transfer line number 812. The line was being used to transfer process waste (containing approximately 25,000 curies of cesium-137) from the 244-AR Vault to 241-C-106 in 241-C Tank Farm. The leak occurred at the welded junction of a carbon steel segment and a stainless steel segment of the pipeline. The pipeline is identified as line V108/812.

Related Sites/Structures: UPR-200-E-86 is associated with the process transfer line number 812 (Site Code 200-E-153 PL), the 244-AR Vault, and the 241-C Tank Farm.

Process Description: The 812 transfer line is a 5 centimeter (2 inch) diameter carbon steel line with stainless steel joints. It is buried 2.4 meters (8 feet) below ground.

Waste Type: Construction Debris
Waste Description: A leak of approximately 65802 liters (17,385 gallons) of process waste, containing 25,000 curies of cesium-137, caused approximately 36 cubic meters (1,300 cubic feet) of soil to be contaminated. The waste contained approximately 1.35 curies per gallon of cesium-137.

**Description:** This release site is not separately marked or posted. A 1991 site visit found the area around the 291-B Sand Filter delimited by a light weight chain link fence and marked with surface contamination warning signs.

**Location:** The site location is described as being approximately 300 feet (92 meters) south of the 221-B Building and adjacent to the 291-B Stack Sand Filter.

**Release Description:**

A correspondence from Harold Maxfield dated September 24, 1981 states UN-216-E-18 (aka UPR-200-E-90) is an operational dose rate zone, established because of high gamma dose rates emitting from the 291-B Stack Area. It was mistakenly designated as an Unplanned Release Site.

**Related Sites/Structures:** UPR-200-E-90 is associated with the 291-B Stack Sand Filter.

**Waste Type:** Chemicals

**Waste Description:** In September 1980 the area surrounding the 291-B Stack sand filter (inoperable) and filtration system was found to have high gamma dose rates. Millions of curies of radionuclides filtered through these systems and is the source of the radiation according to BHI-00179.

**Description:** This site was released from radiation zone status after the contaminated soil was removed in 1981. It is no longer marked or posted.

**Location:** UPR-200-E-92 had been located along the exterior of the eastern 200 East Area perimeter fence.

**Release Description:** UPR-200-E-92 was the result of contaminated Russian thistle being blown from some of the 200 East Area waste sites and lodging against the east perimeter fence. The thistles decomposed and released radioactive strontium and cesium into the blown sand along the...
The contaminated soil from UPR-200-E-92 was excavated and placed in UPR-200-E-56, which was the site of a leak from the 216-A-24 Retention Basin. WIDS site 200-E-109 addresses the reoccurring contamination of the 200 East Area perimeter fence due to contaminated tumbleweeds accumulating along the fence line.

Waste Type: Demolition and Inert Waste

Waste Description: Small amounts of strontium and cesium were deposited into the sand from contaminated Russian thistle fragments.

This Site Was Consolidated With:

Name: 200-E-109; Contaminated Tumbleweed Accumulation; Contamination Spread in Northeast Corner of 200 East Area

This unplanned release is no longer marked or posted.

Location: UPR-200-E-93 was located along the interior of the eastern 200 East Area perimeter fence, extending from the 207-A Retention Basin to the northeast corner of the 200 East Area.

Release Description: UPR-200-E-93 is the result of contaminated Russian thistle being blown from some of the 200 East Area waste sites and lodging against the east perimeter fence. Over a number of years, the thistles decomposed and formed a layer of radioactivity under the sand along the fence.

Related Sites/Structures: The contaminated soil from UPR-200-E-93 was excavated and placed in UPR-200-E-56, which was the site of a leak from the 216-A-24 Retention Basin. WIDS site 200-E-109 addresses the reoccurring contamination of the 200 East Area perimeter fence due to contaminated tumbleweeds accumulating along the fence line.

Process Description: Contamination areas are often identified that are attributed to the accumulation of blowing contaminated tumbleweeds and tumbleweed fragments.

Waste Type: Chemicals

Waste Description: Small amounts of contamination were deposited into the sand from the contaminated Russian thistle that collected and then decomposed along the fence line.

This Site Was Consolidated With:

Name: 200-E-109; Contaminated Tumbleweed Accumulation; Contamination Spread in Northeast Corner of 200 East Area

This unplanned release is no longer marked or posted.

Location: UPR-200-E-94 was located along the interior of the eastern 200 East Area perimeter fence, extending from the 207-A Retention Basin to the northeast corner of the 200 East Area.

Release Description: UPR-200-E-94 is the result of contaminated Russian thistle being blown from some of the 200 East Area waste sites and lodging against the east perimeter fence. Over a number of years, the thistles decomposed and formed a layer of radioactivity under the sand along the fence.

Related Sites/Structures: The contaminated soil from UPR-200-E-94 was excavated and placed in UPR-200-E-56, which was the site of a leak from the 216-A-24 Retention Basin. WIDS site 200-E-109 addresses the reoccurring contamination of the 200 East Area perimeter fence due to contaminated tumbleweeds accumulating along the fence line.

Process Description: Contamination areas are often identified that are attributed to the accumulation of blowing contaminated tumbleweeds and tumbleweed fragments.
Inactive Status: 1/1/1979

**Description:** The site was a large gravel pit that was sometimes used to decontaminate equipment. The gravel pit had been posted with Surface Contamination Area (SCA) signs. The radiological posting was removed from the gravel pit in 1984. The gravel pit was obliterated by heavy construction equipment in the area during the stabilization of the 216-B-3-1 and 216-B-3-2 ditches. The gravel pit is no longer visible or marked.

**Location:** The site was located inside a gravel pit located north of the 216-B-3-1 Ditch. The 216-B-3-1 Ditch is located east of the 200 East Area perimeter fence.

**Release Description:** In June 1979, the Radiation Monitoring Department was informed that moisture was being encountered in the excavation east of the 200 East Area perimeter fence adjacent to the 216-A-24 Crib, where fill dirt was being obtained for the construction of the 241-AN Tank Farm (see Site Code UPR-200-E-56). Follow-up surveys revealed a maximum of 8,000 counts per minute beta/gamma contamination in the moisture, on the earth moving equipment and in the newly hauled-in soil around the new 241-AN Tank Farm. The contaminated equipment was taken to the large gravel pit north of the 216-B-3 Ditch Diverter Station, where it was decontaminated. The designation of the gravel pit as UPR-200-E-94 (alias UN-216-E-22) is the result of the contamination residue on the bottom of the gravel pit, with beta/gamma activity reading 300 counts per minute.

**Related Sites/Structures:** The site is associated with UPR-200-E-56, 216-B-3-1 and 216-B-3-2.

**Process Description:** In 1970, the gravel pit was posted as a Radiation Zone and used to park regulated (contaminated) equipment during the decontamination of the 216-B-3-2 Ditch. It was used again in 1979 to decontaminate earth moving equipment that became contaminated by digging too close to the 216-A-24 Crib (see UPR-200-E-56). The gravel pit remained posted as a radiological area until 1984.

**Waste Type:** Equipment

**Waste Description:** An earth moving vehicle was found to be contaminated with a maximum of 8000 counts per minute. Equipment decontamination efforts done in the gravel pit left a 300 counts per minute residue on the bottom of the pit. The waste was unknown beta and gamma contamination.

**Code:** UPR-200-E-97

**Classification:** Accepted

**Reclassification:** Consolidated (7/19/2004)

**Type:** Unplanned Release

**Start Date:** 1/1/1980

**Status:** Inactive

**Description:** The site is not separately marked or posted. It had been located near the 216-A-21 crib, inside the stabilized area now known as 200-E-103. The area was surface stabilized in 1999.

**Location:** The site is located south of the 202-A Building near the railroad tunnel. A map attachment to RHO-CD-1048 indicates it was adjacent to the west side of tunnel 218-E-14.

**Release Description:** Ground contamination from an unknown source was detected around the cribs south of PUREX, west of the railroad tunnel (218-E-14).

**Related Sites/Structures:** The release site is associated with the 200-E-103 stabilized area.
Waste Type: Water
Description: Surface soil contamination was identified from an unknown source.

This Site Was Consolidated With:
Code: 200-E-103
Names: 200-E-103; PUREX Stabilized Area; Radiologically Controlled Area - South Side of PUREX

Code: UPR-200-E-105
Names: UPR-200-E-105; Liquid Release in the 241-BY Tank Farm; UN-200-E-105
Type: Unplanned Release
Status: Inactive
Description: The release site is located within the 241-BY tank farm fence. It is not separately marked or posted.
Location: The contaminated liquid discharge occurred at the manifold header at the 241-BY-107 Tank, inside the 241-BY Tank Farm.
Release Description: On December 16 and 17, 1952, first cycle waste leaked from the manifold header at the 241-BY-107 Tank in the 241-BY Tank Farm onto the ground surface. A mechanic forgot to replace and tighten the bolts on the manifold header after breaking one of the bolts at the flange connection to the manifold header while removing a waste pump. On December 16, 1952, at 2:55 PM liquid waste started being pumped from the 241-BX-107 Tank to the 241-BY-107 Tank. A pool of contaminated liquid next to 241-BY-107 was discovered by a chemical trainee on December 17, 1952, just after midnight, when he went to the wrong tank by mistake. He took a dose reading, which was well up on the third scale of the CP meter, and immediately left the area. The pumping at the 241-BX-107 Tank was stopped when they realized where the liquid was coming from. About 87,055 liters (23,000 gallons) of first cycle waste was discharged onto the ground surface in a low, well confined area, measuring about 27.9 square meters (300 square feet).
Waste Type: Stormwater Runoff
Waste Description: The release consisted of first-cycle waste. The exposure rate to the chemical operator trainee was 7.5 rad per hour about 0.91 meters (3 feet) from the liquid. Estimated dose to the individual was 60 millirems. Radiation surveys revealed a maximum dose rate of 150 rad per hour at 5.08 centimeters (2 inches) from the surface of the release.

This Site Was Consolidated With:
Code: 200-E-132
Names: 200-E-132; 241-BX/BY Tank Farm Contaminated Soil; Contamination Migration Beyond the 241-BX/BY fence

Code: UPR-200-E-106
Names: UPR-200-E-106; Contamination at a Burning Ground; UN-200-E-106
Type: Unplanned Release
Status: Inactive
Description: UPR-200-E-106 is an unplanned release that occurred in a burning ground in the 200 East Area.
There is no visual evidence of contaminated material remaining in the 200-E Burn Pit. This Unplanned Release is not marked or posted.

**Location:** The location information contained in the 1946 Occurrence Report is vague. The authors of the PUREX Plant Aggregate Area Management Study Technical Baseline Report (BHI-00178) have assumed that this incident occurred within the 200-E Burning Pit.

**Release Description:** On September 5, 1946 contaminated towels showing radiation levels as high as 2.4 rads/hour (originally measured as 2.5 reps/hour) were found in one of the "burning grounds". The towels were traceable to the Control Laboratory since they were contained with waste from that location. The acronym rep stands for Roentgen Equivalent Physical with one rep equaling 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

**Waste Type:** Water

**Waste Description:** The waste consisted of radiologically contaminated towels.

---

**This Site Was Consolidated With:**

**Code:** 200-E BP  
**Names:** 200-E BP; 200-E Burning Pit; 200 East Burn Pit

**Code:** UPR-200-E-107  
**Classification:** Accepted  
**Names:** UPR-200-E-107; Contamination Spread in 241-C Tank Farm; UN-200-E-107  
**Reclassification:** Consolidated (6/13/2002)  
**Type:** Unplanned Release  
**Start Date:** 1/1/1952  
**End Date:** 1/1/1952  
**Description:** The site is not separately marked or posted from the rest of the tank farm postings.

**Location:** UPR-200-E-107 occurred within the 241-C Tank Farm.

**Release Description:** On November 26, 1952, process waste was being directed to the first tank in a three tank cascade series. The waste failed to cascade to the second tank, indicating the overflow line was plugged. Since there was an urgent need to discharge the waste to these tanks, an overground transfer was attempted. The foreman wanted to check the pump operation. He believed the pump was not yet submerged into the waste and opened the air valve. Since the pump leg was already in the liquid, it discharged waste with sufficient force to be propelled 6 meters (20 feet) away. Approximately 19 liters (5 gallons) of waste was discharged to the ground with a dose rate of 4 rad per hour.

**Related Sites/Structures:** UPR-200-E-107 is associated with the 241-C-110 Tank in the 241-C Tank Farm.

**Waste Type:** Oil

**Waste Description:** The waste was tributyl phosphate (TBP) from the 221-U uranium recovery process. Approximately 18.9 liters (5 gallons) of contaminated liquid was discharged to the ground before the pump could be shut off. The maximum dose rate was 4.2 rad per hour at the surface, including 200 millirem per hour at a distance of 2 inches.

**This Site Was Consolidated With:**

**Code:** 200-E-133  
**Names:** 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm
### Code: UPR-200-E-108
### Classification: Accepted
### Reclassification: Consolidated (6/13/2002)

#### Names:
- UPR-200-E-108; 241-B-102 Tank Release; UN-200-E-108

#### Type: Unplanned Release

#### Status: Inactive

#### Start Date: 1/1/1953
#### End Date: 1/1/1953

#### Description:
The release is not separately marked or posted from the rest of the tank farm.

#### Location:
Contamination spread in and around the 241-B-102 heel jet pit inside the 241-B Tank Farm. The tank is located in the eastern portion of the 241-B Tank Farm.

#### Release Description:
On April 14, 1953, a high level contamination spread was caused when supernatant pumped from 241-B-102 to 241-B-101 spilled to the ground inside the tank farm because a blank was not installed on the heel jet discharge line. The heel jet pit is located near the surface in the center of the tank. Personnel contamination of 4,000 counts per minute on a shoe led to the discovery of the incident. Ground contamination up to 10 rad per hour was identified 3.05 meters (10 feet) from the pit. No significant exposures were known to have occurred. The incident was investigated by the Manufacturing Department as Incident #64, and published as HW-27914. The same incident (same date, location, and circumstances) was later documented by the Radiological Sciences Department on November 5, 1953, as Incident #279 in HW-29957.

#### Waste Type:
Water

#### Waste Description:
Metal waste supernatant from 241-B-102 was released to the ground. Visible evidence of ground contamination was noted with dose rates up to 10 rad per hour on the surface.

#### Status: Inactive

#### Start Date: 1/1/1953
#### End Date: 

#### Description:
The site is not separately marked or posted from the rest of the tank farm.

#### Location:
The release occurred inside the 241-B Tank Farm near the north side of tank 241-B-104.

#### Release Description:
On November 11, 1953, tributyl phosphate (TBP) waste liquid contaminated the ground around the 241-B-104 Tank due to a blocked riser. The incident was created by a pump float jammed in the riser. About noon on November 10, 1953, operations and maintenance personnel were attempting a routine placement of a portable pump within a 30.48 pump float became jammed about 3.35 meters (11 feet) below the flange and broke loose from the pump. Pending salvage of the float, the concrete riser plug was replaced. Shortly after this happened, a routine transfer of 15140 liters (4000 gallons) of TBP waste, followed by a 757 liter (200 gallon) hot water flush, was made into the 241-B-104 Tank without apparent incident. About 12 hours later another 15140 liter (4000 gallon) waste transfer was made, followed by a steam sparge for 10 to 20 minutes. After the steam sparge, a process operator entered the tank farm to determine if the transfer was complete. An area of approximately 27.9 square meters (300 square feet) surrounding the jammed riser was visibly discolored, with exposure rates of 18 rad per hour at a distance of 15.24 centimeters (6 inches) and 100 millirads per hour at a distance of 9.1 meters.
(30 feet). Approximately 567.75 liters (150 gallons) of concentrated waste is estimated to have spread onto the ground. It is assumed that the float partially obstructed the waste flow. When steam pressure was applied, the waste was forced up the riser around the gasketed plug and onto the ground.

**Waste Type:** Barrels/Drums/Buckets/Cans

**Waste Description:** 567.75 liters (150 gallons) of tributyl phosphate waste contaminated the ground at the 241-B-104 Tank. The exposure rate was 18 rad per hour at a distance of 15.24 centimeters (6 inches).

**This Site Was Consolidated With:**

**Reclassification:** Consolidated (6/13/2002)

**Type:** Unplanned Release

**Start Date:** 1/1/1955

**End Date:** 1/1/1955

**Description:** The release occurred in the 241-BY Tank Farm. A crescent shaped area around a valve pit was contaminated. The area is not separately marked or posted.

**Location:** UPR-200-E-110 occurred around the 241-BY-112 Valve Pit, inside the 241-BY Tank Farm.

**Release Description:** UPR-200-E-110 occurred when liquid contaminant spread through the soil from the 112-BY Valve Pit. Several employees were potentially over-exposed as a result of the release at the 241-BY Tank Farm. A crescent shaped area around the 112-BY Pit was contaminated. A fire hose and two worker's gloves were also contaminated.

**Related Sites/Structures:** UPR-200-E-110 was associated with the 241-BY-112 Tank, the 241-BY-112 Valve Pit and the 241-BY Tank Farm.

**Waste Type:** Construction Debris

**Waste Description:** The release consisted of first cycle waste from the 241-BY-112 Tank. UPR-200-E-110 covered approximately 700 cubic meters (25,000 square feet) of ground around the 112-BY Valve Pit. Contamination levels up to 22 rad per hour were recorded.

**This Site Was Consolidated With:**

**Reclassification:** Rejected (4/20/2000)

**Type:** Unplanned Release

**Start Date:** 1/1/1974

**End Date:** 1/1/1974

**Description:** The documented release describes a personnel contamination. The location where the employee became contaminated was not identified beyond "a valve pit outside 202-A."

**Location:** The event occurred in an unidentified valve pit outside the 202-A Building.
An employee had been working in an area where contamination was found. Smearable contamination of 8,000 counts per minute beta-gamma and 1,000 disintegrations per minute of alpha were recorded on the employee. The telephone report documents that an americium lung count was also done on the employee. The results of the lung count reported less than 0.16 nanocuries of americium-241.

Waste Type: Chemicals
Waste Description: Readings of 8,000 counts/minute beta and 1,000 counts/minute alpha were detected on an employee. Americium was detected in a lung count.

Code: UPR-200-E-115
Names: UPR-200-E-115; Contamination Spread Inside 241-AX; UN-200-E-115
Type: Unplanned Release
Status: Inactive
Description: UPR-200-E-115 was liquid release to the soil around the 241-AX-103 Pump Pit inside the tank farm. The site is not separately marked or posted.
Location: The release occurred on the ground adjacent to the 241-AX-103 Pump Pit, inside the 241-AX Tank Farm fence.
Release Description: During bleeding of air from a line, air flowed up (instead of down) causing contaminated liquid to spray onto two employees and the ground adjacent to the 241-AX-103 Pump Pit. The employees were wearing coveralls and assault masks. The 241-AX-103 pump pit was contaminated with levels up to 5 rad per hour. The ground around the pump pit had maximum contamination levels of 2 rad per hour.
Related Sites/Structures: UPR-200-E-115 was associated with the 241-AX-103 Pump Pit and the 241-AX Tank Farm.

Waste Type: Sanitary Sewage
Waste Description: Contaminated liquid from the 241-AX-103 pump pit effected the ground adjacent to the pump pit. Dose rates up to 2,000 millirad per hour were detected.

This Site Was Consolidated With:
Code: 200-E-131

Names: UPR-200-E-116; 241-BY-112 Flush Release; UN-200-E-116
Type: Unplanned Release
Status: Inactive
Description: The site is not separately marked or posted.
Location: The release occurred inside the 241-BY Tank Farm, effecting the area surrounding the 241-BY-112 pump pit.
Release Description: On November 20, 1972, while backflushing a pump in the 241-BY-112 tank, an employee and his surroundings were sprayed with caustic, contaminated flush water due to a gasket failure.
Maximum contamination on the operators outer coveralls was 12 rad per hour at a distance of one inch. Contamination levels around the pit varied from 1 to 3 rad per hour a distance of six inches. The area around the pit was covered with dirt.

**Waste Type:** Process Effluent  
**Waste Description:** An unknown amount of caustic flush water containing cesium-137, yttrium-90, and strontium-89/90 was released with dose rates up to 3 rad per hour at 15 centimeters (6 inches).

Location: The release occurred inside the 241-C Tank Farm, at the 241-C-107 Tank.

Release Description: On April 20, 1957, an airborne particle release caused contamination to spread inside the 241-C Tank Farm fence and extended 91 meters (300 feet) to the south of the badge house and an additional 270 meters (900 feet) to the north of the badge house. The contamination also spread outside of the fence, affecting the south bank of the parking lot. The highest dose rate at the surface was estimated at 50 millirad per hour, with one particle deposited per square foot.

Related Sites/Structures: UPR-200-E-118 is associated with the 241-C-107 Tank and the 241-C Tank Farm.

Waste Type: Water

Waste Description: The contaminated particles on the ground surface read up to 3,000 counts per minute.

This Site Was Consolidated With:

Code: 200-E-133
Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-119
Names: UPR-200-E-119; Contamination Spread Inside 241-AX; UN-200-E-119
Type: Unplanned Release
Status: Inactive
Start Date: 1/1/1969
End Date: 1/1/1969
Description: The release occurred on the ground near the 241-AX-104 Tank. It is not separately marked or posted from the rest of the tank farm.

Location: UPR-200E-119 occurred adjacent to the 241-AX-104 Tank, inside the 241-AX Tank Farm fence.

Release Description: An employee mistakenly pulled a contaminated electrode cable out of Tank 241-AX-104 and set it on the ground. He then removed his contaminated gloves and set them on the ground. Contamination was limited to a small area near the 241-AX-104 Tank, the employee, and the change house. Due to the high dose rate on the electrode, the employee received a whole body and extremity dose.

Related Sites/Structures: UPR-200-E-119 was associated with the 241-AX-104 Tank and Change House.

Waste Type: Stormwater Runoff

Waste Description: The release consisted of high-level waste from Tank 241-AX-104 dripping onto the soil from a contaminated electrode cable that had been inside the 241-AX-104 tank.

**Description:** This site is the soil surrounding and beneath the 241-B-201 Tank in the 241-B Tank Farm.
Location: The tank is located on the north side of the 241-B Tank Farm, inside the fence.

Release Description: In 1968, it was reported the tank had lost 4560 liters (1200 gallons) of waste containing 420 curies of cesium-137. Slowly decreasing liquid levels prompted the tank to be categorized as Questionable Integrity in 1971. In June of 1982, tank 241-B-201 was classified as a confirmed leaker. It was documented on Operating Limit Deviation Report 82-04.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: Approximately 4,500 liters (1,200 gallons) of waste containing 420 curies of cesium-137 leaked from the 241-B-201 Tank.

This Site Was Consolidated With:
Code: 200-E-120
Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Code: UPR-200-E-130
Names: UPR-200-E-130; 241-B-203 Leak; UN-200-E-130
Type: Unplanned Release
Status: Inactive
Description: The release, under the 241-B-203 Tank, is not separately marked or posted.
Location: This release is the soil surrounding and underneath the 241-B-203 Tank, located inside the 241-B Tank Farm. The tank is in the northwest corner of the 241-B Tank Farm.
Release Description: Between 1951 and 1977, unplanned release (UPR) occurred when about 300 gallons (1,136 L) of lanthanum fluoride escaped from tank 241-B-203 and contaminated the soil surrounding and beneath the tank. The leak was determined by decreasing liquid level measurements.
Waste Type: Chemicals
Waste Description: Approximately 1,135 liters (300 gallons) of waste containing lanthanum fluoride leaked from the 241-B-203 Tank.

This Site Was Consolidated With:
Code: 200-E-120
Names: 200-E-120; Contaminated Soil at 241-B Tank Farm; Contamination Migration Beyond the 241-B fence

Names: UPR-200-E-131; 241-BX-102 Release; UN-200-E-131
Type: Unplanned Release
Status: Inactive
Description: The release is not separately marked or posted.
Location: The release includes the soil around and underneath the 241-BX-102 tank, inside the 241-BX Tank Farm.
Release Description: The tank was determined to be leaking based on liquid level measurements and dry well radiation detection profiles. Over time, approximately 266,000 liters (70,000 gallons) of tank waste leaked into the soil. Nineteen new wells were added in 1970 to determine the extent of the plume. An estimated 930 cubic meters (31,000 cubic feet) of soil were affected by the leak. The plume extends eastward in a 1.8 meters (6 foot) band for approximately 30 meters (100 feet).

Waste Type: Water
Waste Description: Approximately 266,000 liters (70,000 gallons) of high-level, nonboiling liquid waste from the 241-BX-102 Tank was released. It contained 51,000 curies of cesium-137.

Waste Type: Storage Tank

Waste Description: Approximately 1520 liters (400 gallons) of liquid, containing high level PUREX waste, has leaked from the 241-C-203 tank.

This Site Was Consolidated With:
Code: 200-E-133
Names: 200-E-133; Contaminated Soil at 241-C Tank Farm; Contamination Migration Beyond the fence at C Farm

Code: UPR-200-E-138
Names: UPR-200-E-138; UPR-200-W-66; Liquid Release from B-Plant; UN-200-E-138
Type: Unplanned Release
Status: Inactive
Description: This is a liquid Unplanned Release from 221-B to the 216-B-2-2 Ditch that terminated in the 216-B-3 Pond. The ditch is within a large, surface stabilized, Underground Radioactive Material area that includes the 216-B-2-1, 216-B-2-2 and 216-B-2-3 Ditches. The Unplanned Release is not separately marked. This release has been consolidated with the 216-B-2-2 Ditch.

Location: The origin of the release occurred at the 8-1 Tank, inside the 221-B Building, in the 200 East Area. The release contaminated an area in the 216-B-2-2 Ditch and the 216-B-3 Pond.

Release Description: On March 22, 1970, a leaking manometer sensing line from the 8-1 Tank inside the 221-B Building was flushed down a floor drain connected to a chemical sewer that contaminated an area in the 216-B-2-2 Ditch and the 216-B-3 Pond. The 207-B Retention Basin was bypassed and was not contaminated as a result of this release. The dose rate on the manometer line in the B Plant pipe gallery was 500 R/hr at a distance of 4 inches. On March 23, 1970 at 6:00 am, a dose rate of 5 R/hr was noted at check point one of the 216-B-2-2 Ditch. On March 24, 1970 at 6:00 am, the dose rate at check point one of the 216-B-2-2 ditch was 2 R/hr. Check point two was 10 mr/hr, check point three was 5 mr/hr, check point four was 2 R/hr and check point five was 1 R/hr.

Related Sites/Structures: UPR-200-E-138 was associated with a manometer sensing line from the 8-1 Tank (inside the 221-B Building), the 216-B-2-2 Ditch, the 216-B-2-3 Ditch and the 216-B-3 Pond. The pipeline associated with this release is sitecode 200-E-188-PL (line 2904-2).

Process Description: After UPR-200-E-138 occurred, the chemical sewer piping from the 221-B Building was flushed to the 216-B-2-2 Ditch (see 200-E-188-PL). Due to the contamination levels from the release, the ditch was then backfilled and a replacement ditch (216-B-2-3) was excavated parallel to and south of the entire length of the old ditch. B Plant effluent was then routed to the new ditch. This pipeline bypasses the 207-B Retention Basin.

Waste Type: Process Effluent

Waste Description: Radioactive liquid was released while attempting to measure the liquid level in the Storage Tank 8-1, located inside the 221-B Building. A breakdown of the radioactive material released indicates 1,495 curies (total beta) was discharged to the ditch including approximately 950 curies of strontium-90, 96 curies of cerium/promethium-144 and 1 curie of cesium-137.

This Site Was Consolidated With:
Code: 216-B-2-2
Names: 216-B-2-2; 216-B-2-2W; 216-B-1 Ditch
### Code: UPR-200-E-140
#### Classification: Accepted

**Names:** UPR-200-E-140; PCB Oil Spill at 211-B Bulk Chemical Storage Area; UN-200-E-140

**Type:** Unplanned Release

**Status:** Inactive

**Description:** No warning signs or evidence of the unplanned release were observed during a 1991 site visit. Later, a single post was placed into the ground, with a WIDS Sitecode number sign, to mark the approximate location where the release occurred.

**Location:** The 211-B Bulk Storage area is located north of the 221-B building. The spill site is located at the southwest corner of the 211-B Bulk Chemical Storage Area in the 200 East Area.

**Release Description:** The Hanford Site Waste Management Units Report (1987) states that UPR-200-E-140 occurred on April 23, 1986. Less than 7.6 liters (2 gallons) of oil containing between 1 to 38 parts per million of polychlorinated biphenyl (PCB) was spilled to the ground at the southwest corner of the 211-B Bulk Storage Area.

**Related Sites/Structures:** UPR-200-E-140 was associated with the 211-B Bulk Chemical Storage Area.

**Waste Type:** Storage Tank

**Waste Description:** The release consisted of oil contaminated with polychlorinated biphenyls (PCBs) at a concentration of 1 to 38 parts per million.

### Code: UPR-200-E-141
#### Classification: Not Accepted

**Names:** UPR-200-E-141; 2718-E Building Uranyl Nitrate Spill to Ground; UN-200-E-141

**Type:** Unplanned Release

**Status:** Inactive

**Description:** The site is a release of corrosive uranyl nitrate onto asphalt and soil that occurred at the 2718-E Building. The site was located within a fenced area that includes the 209-E facility. The contaminated asphalt and soil were removed until only background levels remained. The site is not currently marked or posted.

**Location:** The site had been adjacent to the 216-C-7 Crib and the southeast corner of the 2718-E building. It was southwest of the 209-C Building.

**Release Description:** In September 1984, a 208-liter (55-gallon) container failed due to corrosion, releasing its contents.

**Related Sites/Structures:** UPR-200-E-141 was associated with the 2718-E Building.

**Waste Type:** Storage Tank

**Waste Description:** The release consisted of uranyl nitrate (corrosive), and 84% uranium-235 (source radioactive) from a 207 liter (55 gallon) drum being stored on an asphalt pad.

### Code: UPR-200-E-142
#### Classification: Accepted

**Names:** UPR-200-E-142; 202-A Diesel Fuel Spill; UN-200-E-142

**Type:** Unplanned Release

**Status:** Inactive

The site was located within a fenced area that includes the 209-E facility. The contaminated asphalt and soil were removed until only background levels remained. The site is not currently marked or posted.

**Location:** The site had been adjacent to the 216-C-7 Crib and the southeast corner of the 2718-E building. It was southwest of the 209-C Building.

**Release Description:** In September 1984, a 208-liter (55-gallon) container failed due to corrosion, releasing its contents.

**Related Sites/Structures:** UPR-200-E-141 was associated with the 2718-E Building.

**Waste Type:** Storage Tank

**Waste Description:** The release consisted of uranyl nitrate (corrosive), and 84% uranium-235 (source radioactive) from a 207 liter (55 gallon) drum being stored on an asphalt pad.
Type: Unplanned Release  
Start Date: 1/1/1986

Status: Inactive
End Date:

Description: The release site is not physically marked.

Location: The site is located north of the 202-A Building at the 202-A Building diesel fuel tank.

Release Description: The Hanford Site Waste Management Units Report (1987) states that on November 17, 1986, the tank of a diesel-fueled compressor overflowed during filling. The release consisted of 76 liters (20 gallons) of diesel fuel.

Waste Type: Storage Tank
Waste Description: The release consisted of approximately 75.7 liters (20 gallons) of diesel fuel.

Code: UPR-200-W-7  
Classification: Accepted

Names: UPR-200-W-7; Contamination Spread from the 241-T-151 and 241-T-152 Diversion Boxes; UN-200-W-7
Reclassification: Consolidated (6/13/2002)

Type: Unplanned Release  
Start Date: 1/1/1950

Status: Inactive
End Date:

Description: The release occurred inside the 241-T Tank Farm. The Tank Farm is surrounded with a chain link fence and posted with radiological warning signs. The diversion boxes have been covered with a protective foam layer. The unplanned release is not separately marked or posted.

Location: The 241-T-151 and 152 Diversion Boxes are located in the southeast corner of the 241-T Tank Farm - inside the tank farm fence.

Release Description: Work done in the spring of 1950 at the 241-T-151 and 241-T-152 diversion boxes resulted in contamination spread to the ground around both boxes.

Waste Type: Storage Tank
Waste Description: Dried, loose specks spread from the diversion box and contaminated the surrounding area.

This Site Was Consolidated With:  
Code: 200-W-93
Names: 200-W-93; Contaminated Soil at 241-T Tank Farm

Code: UPR-200-W-10  
Classification: Accepted

Names: UPR-200-W-10; Contamination Spread at 203-S UNH Tanks; UN-200-W-10
Reclassification: Consolidated (7/19/2004)

Type: Unplanned Release  
Start Date: 1/1/1952

Status: Inactive
End Date: 1/1/1952

Description: The site consisted of an area around the 203-S Uranium Nitrate Hexahydrate (UNH) tanks. The 203-S facility area has been decommissioned and surface stabilized (see 200-W-22). It is currently posted with Underground Radioactive Material signs. The release is not separately marked or posted.

Location: The 203-S Uranium Nitrate Hexahydrate (UNH) tanks were located northwest of the 202-S
Building.

**Release Description:** In the summer of 1952, the ground around the 203-S Uranium Nitrate Hexahydrate storage tanks were contaminated with uranium. A maximum of 10,000 counts per minute at 25 centimeters (1 inch) was found in this area. The contaminated area was covered with blacktop and surrounded with a wooden rail fence. The fence was posted with Radiation Zone signs in 1952.

**Related Sites/Structures:** The site is associated with the 203-S tanks and sitecode 200-W-22.

**Process Description:** The 203-S, 204-S and 205-S Facilities were constructed in the early 1950's as a process unit for the decontamination of uranyl nitrate hexahydrate (UNH) produced by Reduction Oxidation (REDOX) operations. The primary process unit consisted of a column filled with silica gel that removed traces of fission products from the UNH. The silica gel column (SG-1) was located in the underground 205-S vault. The vault also contained a waste neutralization tank. Operations in the vault were accomplished remotely. The 205-S facility was a two story, aboveground, chemical make-up building. It contained two chemical make-up tanks, a UNH sample room and extensive piping connected to the REDOX facility and the underground vault. The 203-S facility was an aboveground UNH storage facility that consisted of two 19,000 liter (5,000 gallon) stainless steel tanks that were set in an open concrete basin. A UNH Unloading Facility was located at the adjacent railroad siding. An aboveground UNH pipeline connected the 203-S, 204-S, 205-S Area to the 224-U (UO3 Plant). During the REDOX Plant operation, the UNH solution was pumped from REDOX to the 205-S silica gel column for purification. The purified UNH was stored in the 203-S and 204-S tanks and then routed to 224-U for final processing via the above ground pipeline.

**Waste Type:** Storage Tank

**Waste Description:** The release was described as uranium contamination of the soil with a maximum reading of 10,000 counts per minute at 25 centimeters (1 inch).

**This Site Was Consolidated With:**

- **Code:** 200-W-22
- **Names:** 200-W-22; 203-S/204-S/205-S Stabilized Area

**Description:** This site was a result of a spontaneous fire in the 218-W-1 Burial Ground. It is also a duplicate of UPR-200-W-16, which was mapped correctly on the 218-W-1 Burial Ground.

**Location:** The unplanned release occurred in and surrounding one of the trenches located in the 218-W-1 Burial Ground. The trench where the fire occurred runs east and west and was roughly in the center of the burial ground. A fire in the dry waste, spread plutonium contamination to the north and south sides of the trench and outside the burial ground in the vicinity of 231-W (also known as 231-Z). The earliest document (HW-25227) described the release as "in the vicinity of the Z Facility" and also as "the area north of the Isolation Building" (231-W).

**Release Description:** A fire occurred on July 9, 1952 in the "200 West Burial Ground," causing a spread of plutonium contamination to the north of the Isolation Building. Spotty airborne plutonium contamination from this fire fell out of the smoke in the vicinity of the Z Facility. The fire was
This fire actually occurred at the 218-W-1 Burial Ground, and not immediately outside the PFP Building, as it was mis-mapped. The correct location (WIDS site UPR-200-W-16) was verified in Selby and Soldat (1958).

**Waste Type:** Storage Tank  
**Waste Description:** Eighteen air samples were collected near the 200 West Area Burial Ground during the fire of July 9. Only one of the samples showed detectable alpha activity, this being 2.6 by 2.6E+12 microcuries/cubic centimeter. A vegetation sample collected near the Meteorology Tower on the following day showed an activity density from alpha emitters of 1.5E+06 microcuries/gram. Resamples collected several days later did not confirm this result.

<td>The unplanned release was a liquid contamination release that effected the 207-S Retention Basin and the 216-S-17 Pond (REDOX Swamp). Both the pond and the basin have been surface stabilized and posted as &quot;Underground Radioactive Material&quot;. The unplanned release is</td>
</tr>
</tbody>
</table>
not separately marked or posted.

**Location:** The 207-S Retention Basin is located inside the 200 West Area, southwest of 202-S. The 216-S-17 Pond is located southwest of 200 West Area, outside the perimeter fence.

**Release Description:** In November 1952, a leak in the Oxidizer Vessel (H-4) steam coil at the REDOX Facility caused further gross contamination of the 207-S Retention Basin and the swamp area outside the 200 West Area (216-S-17). Over a three day period following the release, dose rates at the pond inlet increased from 6 millirems per hour to 700 millirems per hour. The REDOX process was shut down at the end of the month to replace the leaking coil.

**Related Sites/Structures:** The release is associated with the REDOX facility (202-S), the 207-S Retention Basin, and the 216-S-17 Pond.

**Process Description:** The 216-S-17 Pond was the only pond receiving REDOX process cooling water when the release occurred. The pond was used from 1951 to 1954 and was taken out of service because it exceeded contamination limits.

**Waste Type:** Storage Tank

**Waste Description:** In a three day period, the dose rate 15 centimeters (6 inches) over the inlet water stream to the pond increased from 6 millirems/hour to 700 millirems/hour. The acronym "rep" stands for Roentgen equivalent physical. One rep equals 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

**Release Description:** In October 1952, a steam coil failure in the REDOX "D-12" Waste Concentrator caused gross contamination of process cooling water, the 207-S Retention Basin, and the swamp area outside of the 200 West Area (216-S-17). Dose rates at the swamp up to 2 Rad per hour were recorded. A dike was constructed to maintain a constant water level.

**Related Sites/Structures:** The release is associated with the REDOX facility (202-S), the 207-S Retention Basin, and the 216-S-17 Pond.

**Process Description:** The 216-S-17 Pond was the only pond receiving REDOX process cooling water when the release occurred. The pond was used from 1951 to 1954 and was taken out of service because it exceeded contamination limits.

**Waste Type:** Storage Tank
Rev. 24

DOE/RL-88-30

According to the October 1952 monthly report, fission product activity was detected in the 207-S Retention Basin and at the edge of the 216-S-17 Pond. Measurements taken of dry sand at the periphery of the pond were as high as 2200 millireps/hour (CP window open) and 80 millirads/hour (CP window closed). The acronym "rep" stands for Roentgen equivalent physical. One rep equals 95 ergs/gram (0.0095 joules/kilogram). One rep is roughly equivalent to 1 rad.

Description: The Unplanned Release is the result of a 1952 spontaneous fire in the 218-W-1 Burial Ground. Alpha contamination was found outside the boundary of the burial ground.

Location: The unplanned release occurred in and surrounding one of the trenches located in the 218-W-1 Burial Ground. The trench where the fire occurred runs east and west and is roughly in the center of the burial ground. A fire in the dry waste spread plutonium contamination to the north and south sides of the trench and outside the burial ground in the vicinity of 231-W (also known as 231-Z).

Release Description: A fire in the Dry Waste Burial Ground occurred on July 9, 1952, spreading alpha contamination from waste boxes. A survey of the area found a maximum of 20,000 disintegrations inside the burial ground and 30,000 disintegrations outside the burial ground.

Related Sites/Structures: This fire occurred in the 218-W-1 Burial Ground.

Waste Type: Process Effluent

A fire occurred in the 200 West Area Dry Waste Burial Ground on July 9, 1952. Surveys after the fire did not reveal any contamination spread to personnel or equipment. However, appreciable alpha contamination was found on the ground. The maximum reading was 200,000 disintegrations per minute in the burial ground and 30,000 disintegrations outside the burial ground. The burial trench contained cardboard boxes used to dispose of dry waste such as rags, paper, gloves, etc. Procedures limit the amount of plutonium to 5 grams per box, although most boxes contained less than one gram of plutonium. It was estimated that less than 500 grams of plutonium would have been present in the burial trench at the time of the fire.

Hanford Site Waste Management Units Report
February 2015

2264
Description: The release occurred inside the tank farm fence. The tank farm is surrounded with a chain link fence and radiological warning signs. The release is not separately marked or posted.

Location: The release occurred inside the 241-TX Tank Farm fence, extending southward from the 241-TX-106 Tank to the 244-TXR Vault area and northward from 241-TX-106 to the 241-TX-114 Tank.

Release Description: On September 12, 1952, contamination spread in the 241-TX Tank Farm during the removal of a temporary process waste pump from the 241-TX-106 Tank. Waste was being transferred from 241-TX-106 to 241-TX-114 Tank via an overground line. The contamination on a pump seal was not sufficiently removed or packaged prior to moving the assembly, affecting the ground, personnel, and vehicles at the job site. Adverse wind conditions developed before the contamination could be totally removed or fixed, which caused the contamination spread to enlarge.

Waste Type: Equipment

Waste Description: Contamination consisted of cerium, cesium, nobelium, ruthenium, strontium, and zirconium.

After the wind had subsided, the southern area of the 241-TX tank farm was found to be contaminated generally up to 6,000 c/m with isolated spots up to 50,000 c/m. The "major construction zone" immediately south of the 241-TX area had lesser amounts of contamination up to 2000 c/m with a maximum of 35,000 c/m detected. Less than 1 g of solvent was dispersed by the wind.

This Site Was Consolidated With:

Code: 200-W-94
Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

Code: UPR-200-W-18
Names: UPR-200-W-18; Liquid Release to 216-U-9
Type: Unplanned Release
Status: Inactive

Description: WIDS site UPR-200-W-18 has been reclassified based on documentation that verified it was a DUPLICATE of UPR-200-W-139. Other documentation verified that WIDS site UPR-200-W-139 was located within the boundary of the larger site of 216-U-9 Ditch and has been consolidated into that site. Future updates and closeout information will only be added to 216-U-9 Ditch. This site will no longer be updated.

Location: The site is located in the 200 West Area.

Release Description: In September 1953, contamination from an unknown source was detected in the 216-U-9 Ditch.

Related Sites/Structures: The site is associated with the 216-U-9 Ditch.

Waste Type: Storage Tank

Waste Description: The waste was unknown contamination of the 216-U-9 ditch.

This Site Was Consolidated With:

Code: 216-U-9
Names: 216-U-9; U Swamp-S Swamp Ditch; 216-U-6

<tr>
<td>Release Description: On April 30, 1953, a contamination spread was caused by a violent chemical reaction in the 002 Blending Tank of the 244-UR Vault. The incident occurred when metal waste supernate was being pumped from the 241-U-109 Tank into the 002-UR Blending Tank inside the 244-UR Vault. Pressure built up from the waste reacting with acid in the 002 tank and was suddenly relieved through a riser. A geyser of liquid was seen rising 9 meters (30 feet) above the vault cover blocks, persisting for approximately 30 seconds. Five people in the area were found to be contaminated with maximum contamination levels of 4,000 counts per minute. Wind (estimated at 20 miles per hour) blew the contamination in a southeast direction beyond the tank farm fence and across the road (Camden Avenue). Ground surface contamination varied from 35 rad per hour at the point of origin (on the 244-UR cover blocks) inside the tank farm,</td>
<td></td>
</tr>
</tbody>
</table>
Uranium metal waste supernate was being pumped from the 109-U tank to the 002-UR blending tank prior to being fed into 221-U for continuation in the Tri butyl Phosphate separations process.

Waste Type: Storage Tank

Waste Description: Waste included metal waste supernate combined with nitric acid, with readings varying from 35 rad/hour at the source of the contamination to a few hundred counts per minute at a distance of 305 meters (1,000 feet) from the source.

This Site Was Consolidated With:

Code: 200-W-95
Names: 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

Code: UPR-200-W-26
Names: UPR-200-W-26; Contamination Spread During Burial Operation
Type: Unplanned Release
Status: Inactive
Start Date: 1/1/1953
End Date: 1/1/1953

Description: The release is not marked or posted. All the inactive 200 West Area burial grounds are marked and posted Underground Radioactive Material. Only portions of the railroad tracks are currently posted with radiological signs. No specific location or maps are included in the Radiation Incident Investigation Report to indicate where the contamination was found.

Location: Contamination was identified in the railroad burial ground and along the railroad tracks.

Release Description: On November 27, 1953, a box of used connectors was removed from 221-T and buried in the railroad burial garden. While unloading the box from the flatcar, the box lid was dislodged and contamination was spread to the flatcar and to the surrounding ground. Before the contamination had been removed, a sudden strong wind resulted in additional contamination spread. More contamination was discovered when a comprehensive traverse survey was made of the burial garden and adjacent areas, the T plant railroad spur, and (following discovery of previously unsuspected railroad contamination) the main railroad line between the burial garden and REDOX. The Radiation Incident Investigation report did not include any recommendations for reducing the contamination at the burial ground.

Related Sites/Structures: This release is probably associated with the 218-W-1A Burial Ground, near T Plant.

Waste Type: Process Effluent

Waste Description: A comprehensive traverse survey was made of the burial garden and adjacent areas, the T plant railroad spur, and (following discovery of previously unsuspected railroad contamination) the main railroad line between the burial garden and Reduction Oxidation (REDOX). Survey results were as follows: general particulate contamination in and near the burial garden with spots up to 600 mrep/hour (uncorrected for source size) at the surface; numerous spots along the T plant spur of similar levels, with one spot of 15 rep/hour at surface; general particulate contamination in large areas to the southeast and southwest of the burial garden; and numerous spots on both sides of the main railroad line to REDOX having dose rates up to 2 rep/hour (uncorrected for source size) at surface. Highest concentrations of particles (greater than one particle per square yard) were found along the main line west of U plant and west of the powerhouse, and in a large area southwest of the burial garden. Analysis of three spots of...
contamination, taken from (1) the area southwest of the burial garden, (2) from the T plant spur, and (3) the main line near U plant, revealed the activity to be greater than 95% ruthenium.

This Site Was Consolidated With:

Names: 218-W-1A; Equipment Burial Ground #1; 200-W Area Industrial Waste Burial Ground #1

Code: UPR-200-W-27
Names: UPR-200-W-27; Duplicate of UPR-200-W-29; Transfer Line Leak at 23rd and Camden; UN-200-W-27; UN-216-W-5
Type: Unplanned Release
Status: Inactive
Description: This is a DUPLICATE of UPR-200-W-29, which occurred on November 15, 1954 at the corner of 23rd and Camden Avenue.
Location: The site is located at the southeast corner of the intersection of Camden Street and 23rd Street.
Release Description: The release was caused by the failure of an un-encased first-cycle waste line from T Plant, which resulted in a cave-in, run-off of solution, and high ground-surface dose rates.
Waste Type: Equipment
Waste Description: The release was approximately 3800 liters (1000 gallons) of first-cycle process waste from T Plant. (This is a duplicate of UPR-200-W-29)

This Site Was Consolidated With:
Code: UPR-200-W-29
Names: UPR-200-W-29; 23rd and Camden Line Break; Transfer Line Leak; UN-200-W-27; UN-200-W-29; UN-216-W-5; UPR-200-W-27

Code: UPR-200-W-30
Names: UPR-200-W-30; 216-S-12; UN-200-W-30
Type: Trench
Status: Inactive
Description: WIDS site UPR-200-W-30, has been reclassified based on documentation that verified it was a DUPLICATE of 216-S-12. Future updates and closeout information will only be added to 216-S-12. This site will no longer be updated. The site was surrounded with a light chain and "Underground Radioactive Material" signs. A concrete marker post was labeled 216-S-12. The surface was sand and gravel with no vents or evidence of subsidence.
Location: The site was located northeast of the 202-S building, north of the 291-S stack.
Release Description: Early in July 1954, the REDOX stack was flushed and approximately 75,700 liters (20,000 gallons) of flush water was drained into a pit 6.1 meters (20 feet) wide, 27.4 meters (90 feet) long and 3 meters (10 feet) deep situated in the northeast corner of the REDOX exclusion area. An estimated five curies of beta particle emitters and two to three curies of gamma particle emitters, predominantly ruthenium and zirconium-niobium, were disposed of here and covered with several feet of clean soil. The approximate plant coordinates are: N34965 and W73384.
Related Sites/ Structures: The site was associated with the 291-S Stack and 216-S-12. The excavation was described as a 6.1 meters (20 feet) wide by 27.4 meters (90 feet) long by 3 meters (10 feet) deep pit near the
Process Description: The site was a single-use liquid waste disposal pit used for 291-S stack flush water.

Waste Type: Storage Tank

Waste Description: The site received 68,100 liters (18,000 gallons) of flush water from the 291-S (REDOX) Stack. The water contained ammonium nitrate (600 kilograms). The material contained an estimated five curies of beta particle emitters and two to three curies of gamma particle emitters that were predominantly ruthenium and zirconium-niobium. Potential contaminants of concern include cobalt-60, cesium-137, strontium-90, plutonium-239/240, and uranium-238.

This Site Was Consolidated With:

Code: 216-S-12
Names: 216-S-12; 291-S Stack Wash Sump; REDOX Stack Flush Trench; UPR-200-W-30

Code: UPR-200-W-34
Names: UPR-200-W-34; Overflow of the 216-S-10 Ditch; UN-200-W-34
Type: Unplanned Release
Status: Inactive
Description: The site is an unplanned release resulting from an overflow of the 216-S-10 Ditch. The site is described as 0.4 hectare (1 acre) large, located between the open 216-S-10 Ditch and the REDOX Chemical Sewer Trenches (aka 216-S-11). The release area is not separately marked or posted. The site has been consolidated with the 216-S-10 Ditch.
Location: The release site was located south of REDOX, outside the 200 West area perimeter fence.
Release Description: During May 1955, overflow from the open ditch (216-S-10 Ditch) to REDOX Chemical Sewer Trenches (216-S-11) contaminated about 0.4 hectares (1 acre) of ground between the open ditch and the east trench. The maximum dose rate detected was 1 rad/hour at the ground surface. (HW-60807 says the overflow occurred in May 1955. RHO-CD-673 quotes the May 1954 Monthly Report for this release)
Related Sites/Structures: This release is associated with the 216-S-10 Ditch, 216-S-10 Pond and the 216-S-11 Ponds.

Waste Type: Process Effluent
Waste Description: The process that the waste originated from, and the quantity of the overflow was not described in the original reference. The maximum dose rate detected was 1 rad/hour at the ground surface.

This Site Was Consolidated With:

Code: 216-S-10D

Code: UPR-200-W-37
Names: UPR-200-W-37; Contaminated Boxes Found in a Burn Pit (Z Plant Burn Pit)
Type: Unplanned Release
Start Date: 1/1/1955

Classification: Accepted
Reclassification: Consolidated (5/6/2004)
The burn pit mentioned in the occurrence report describes the location of the Z Plant burn pit. The burn pit is not marked or posted. It was located in an area that is currently part of the 218-W-4C Burial Ground.

The burning pit was located east of Dayton Avenue, southwest of Z Plant.

Page 9 from a letter report titled Summary of CPD and Environmental Activities states that on June 10, 1955 during the 12-8 shift, three boxes containing high-level dry waste that were supposed to be taken to the burial ground, were mistakenly dumped into a pit adjacent to a 200 West Area road (along the west perimeter road). Six hours later, personnel delivering scrap to the construction burning pit saw the boxes marked with radiation symbols. A survey found that one box had broken open. Three cotton swabs and two tissues were found with contamination levels of 100 millirad per hour. The other two boxes were still sealed. The waste cartons were removed and sent to the proper burial trench. The pit was decontaminated before returning to its original use as a burning pit.

The unplanned release is associated with the Z Plant Burning Pit and the 218-W-4C Burial Ground.

Burning grounds routinely received nonradioactive construction and office waste, chemical solvents, and paint waste to be burned.

Contents from the broken boxes included three cotton swabs and two tissues that were contaminated to a maximum of 100 millirad/hour. The site was cleaned by removing the cartons to the proper burial trench and decontaminating the pit.

This site code is recommended for deletion because it is a duplicate of UPR-200-W-38 and UPR-200-W-160. UPR-200-W-38 has been selected to be the 'surviving' site code for this incident.

The spill occurred in 200 West Area, southeast of the 221-T Building between the 241-TX-154 Diversion Box and the 241-TX-302C Catch Tank.

On December 30, 1955, highly radioactive waste was spilled on the ground. The release consisted of highly radioactive liquid waste due to failure of an underground line during a waste transfer from the 241-TX-302C Catch Tank. A pool of liquid waste with a high dose rate was identified on the surface near the 241-TX-302 Catch Tank (December 30, 1955). It was estimated that several thousand gallons of "metal" waste and rain water had been released to the ground.

Equipment
**Waste Description:** Several thousand gallons of primarily metal waste and rainwater. RHO-CD-673 estimated 19,000 liters (5026 gallons). Other reference documents estimated 7520 liters (2000 gallons). The waste was high in salt and is neutral to basic. High beta/gamma levels were recorded, up to 100 rads/hour at 0.3 meters (1 foot) above the liquid.

**Location:** In 1957, contamination was found in and around the railroad shack (2706-S) near the REDOX facility.

**Release Description:** On February 3, 1957, an unusually high radiation background was noticed by two operators on a routine supply check in the railroad shack (2706-S) north of REDOX. The shack was evacuated and radiation monitoring was immediately called. A follow up survey revealed contamination on the papered floor to 3,200 millirad/hour. Spotty contamination to 500 millirad/hour was found on the snow outside of the shack by the south exit. near the 202-S Canyon Building, and toward the telephone and railroad tracks. The cause of the contamination is unknown.

**Related Sites/Structures:** The site is associated with the REDOX railroad cut and UPR-200-W-41.

**Waste Type:** Storage Tank

**Waste Description:** The floor of the shack was contaminated with beta/gamma with readings to 500 millirads/hour on the snow outside of the shack and beta/gamma with readings to 3,200 millirads/hour on the papered floor inside the shack.

**Description:** This release is no longer able to be visually identified. The release is not marked or posted. Based on the date of the release and a sketch included in HW-54636, it is assumed to be associated with 218-W-2A Burial Ground.
Location: Airborne contamination was spread from a 200 West Burial Ground and covered an estimated 10 square kilometers (4 square miles) in and around the 200 West Area.

Release Description: On November 6, 1957, a burial box containing ruthenium contaminated process equipment from REDOX collapsed and released contamination throughout 200 West Area. The incident presumably occurred after the first bucket of dirt was dropped on the burial box lid in the burial ground at 0800 hours. A cloud of contamination was released and spread outside the burial ground. Skin and/or personal clothing contamination to twelve Chemical Processing Department employees occurred. Fifteen vehicles were also contaminated at the time of the incident, 5 of which were contaminated on the tires only. The cause of the contamination spread was believed to be thermal convection currents coming from around the contaminated equipment and becoming airborne. The heaviest contamination spread to the south and in subsequent days the contamination spread throughout the area by high winds. The half life of ruthenium-106 is 372.5 days.

Related Sites/Structures: Based on the date of the release and a sketch included in HW-54636, it is assumed to be associated with 218-W-2A Burial Ground. 218-W-2A was active in 1957. The adjacent railroad track was used to transport large pieces of contaminated equipment.

Waste Type: Process Effluent

Waste Description: Collapse of wooden burial box containing ruthenium contaminated process equipment from Reduction Oxidation (REDOX) during burial operations in a 200 West Area Burial Ground. Extensive surveys revealed ground contamination of 5 to 100 particles per 0.09 square meter (5 to 100 particles per square foot). A majority of the readings were from 10,000 to greater than 80,000 counts per minute, with a maximum of 1,100 millirads/hour.

Location: The 216-S-16 Pond is located southwest of the 200 West area. The release affected an area 140 meters (150 yards) west and 270 meters (300 yards) north and south of the pond dike boundary.

Release Description: In June 1958 and again in April 1959, breaks in the REDOX Cooling Water Swamp (216-S-16P) dike occurred. The released cooling water contaminated an area to the west, north, and south of 216-S-16 pond. Contamination levels up to 750 millirem per hour were recorded.

Related Sites/Structures: The release was related to the 216-S-16 Pond.

Waste Type: Equipment

Waste Description: The release consisted of contaminated process cooling water from REDOX. The ground was contaminated to a maximum reading of 750 millirads/hour.

This Site Was Consolidated With:
The 241-SX Tank Farm is currently surrounded with a chain link fence posted with various radiological warning signs. The unplanned release located outside the tank farm fence, as described in 1958, is not marked or posted.

In 1958, contamination from inside 241-SX Tank Farm was spread by the wind, causing an area of approximately 464.5 square meters (5000 square feet) outside of the southeast corner of 241-SX Tank Farm to be contaminated.

On July 22, 1958, the ground between the 241-SX-111 and 241-SX-113 tanks was contaminated with levels up to 6 rads per hour. Although the area inside the tank farm had been decontaminated, a follow-up survey again revealed numerous specks with dose rates up to 5 rad/hour inside the tank farm. On July 31, 1958, a survey of the area outside the southeast corner of 241-SX Tank Farm identified ground contamination with readings up to 150 millirads per hour over an area measuring approximately 464.52 square meters (5000 square feet). One spot was found with a dose rate of 10 rads per hour. The area extended southeast of the 241-SX-113 tank, with an average reading of 100 millirads per hour at a distance of 7.6 meters (25 feet) from the tank. The cause of the contamination found outside the tank farm was determined to be wind spreading the residual contamination from the release that occurred on July 22, 1958. Recommendations were made to establish a radiation zone outside the tank farm.
**Release Description:** On August 25, 1958, windborne contaminated soil from the 241-SX Tank Farm spread eastward resulting in approximately 2 acres of contaminated ground outside of the tank farm. During the previous week, conditions in 241-SX-114 tank caused the tank to "bump" three times. On the morning of August 25, 241-SX-114 "bumped" again and showed pressure to 71 inches of water. Steam was observed escaping from the risers of all the tanks in the immediate area. Two of the risers in 241-SX-113 tank pump pit were not sealed. The "bumps" in 241-SX-114 forced contaminated vapors out of the 241-SX-113 tank pump pit. Contamination was deposited on the ground around 241-SX-113 and was spread outside the tank farm by the high wind. The contamination inside the tank farm measured approximately 1350 square meters (15,000 square feet) with a maximum dose rate of 5 rads/hour. An area measuring approximately 2 acres east of the tank farm was contaminated, with readings ranging from 40,000 counts per minute to 100 millirads per hour.

**Related Sites/Structures:** The release is associated with the 241-SX Tank Farm and UPR-200-W-114.

**Waste Type:** Process Effluent

**Waste Description:** The release included contamination specks from 241-SX-114 and 241-SX-113 with beta/gamma readings of 40,000 counts/minute and spots up to 100 millirads/hour.

**Waste Type:** Process Effluent

**Waste Description:** Contaminated particulates from the diversion box contaminated a large area south of the tank farm.
**Status:** Inactive  
**End Date:**

**Description:** The release site is not separately marked or posted.

**Location:** The major portion of the contamination was spread about 101 hectares (250 acres) extending in an easterly direction from the 218-W-2A Burial Ground to within 275 meters (300 yards) of the east perimeter fence of the 200 West Area. Spotty particulate contamination was also detected outside of the 200 West Area perimeter fence.

**Release Description:** On January 8, 1959, a burial box containing REDOX cell jumpers collapsed during backfilling operations at the burial grounds and spread fission product contamination generally eastward covering about 101 hectares (250 acres) in 200 West Area. Ten people received low-level skin and personal clothing contamination and thirteen government-owned vehicles and two railroad diesel engines were also contaminated. One private vehicle was contaminated. Contamination levels ranged from 50 millirads/hour at the burial site to 60,000 counts per minute at T-Plant. Readings up to 400 counts per minute were obtained east of the 200 West Area fence.

**Waste Type:** Process Effluent  
**Waste Description:** The release contained fission product (ruthenium-106) with beta/gamma readings that ranged from 50 millirads/hour at the burial site to 60,000 counts/minute at T Plant and readings east of the 200 West Area fence at 400 counts/minute.

</tr>
</tbody>
</table>

**Release Description:** On September 26, 1965, a leak occurred in the 2D column feed tank (F-1) cooling coil. Process effluent entered the cooling water from the coil and was transported from REDOX to the 216-S-16 Pond. The maximum dose rate found at the water edge of the #1 pond lobe inlet was 190 millirads/hour. The release was promptly detected by a radiation monitor.

**Related Sites/Structures:** The release is associated with the REDOX facility (202-S) and the 216-S-16 Pond.

**Process Description:** Process cooling water and steam condensate was routinely discharged to the 216-S-16 pond from the REDOX facility.

**Waste Type:** Process Effluent  
**Waste Description:** Beta/gamma radiation with a maximum dose rate of 190 millirads/hour was measured at the 216-S16 Pond #1 Pond (lobe) inlet.
(216-S-16P; REDOX Pond #2; 202-S Swamp #1; 202-S Swamp and Ditch)

**Code:** UPR-200-W-62
**Names:** UPR-200-W-62; Duplicate of UPR-200-W-97; Line Leak at 23rd and Camden; UN-200-W-62; UN-216-W-5
**Type:** Unplanned Release
**Status:** Inactive
**Start Date:** 1/1/1966
**Classification:** Accepted
**Reclassification:** Consolidated (12/7/2004)
**Description:** The area has been stabilized with gravel. It is surrounded with Underground Radioactive Material signs.
**Location:** The incident occurred at the corner of Camden Avenue and 23rd Street in 200 West Area.
**Release Description:** On May 4, 1966, contaminated liquid waste leaked from a ruptured transfer line and came to the ground surface during transfer of second-cycle waste (bismuth phosphate) from the 241-T-107 Tank to the 242-T evaporator feed tank. Liquid ran from the site of the leak and spread over an area about 2 yards (1.83 meters) wide and 40 yards (36.58 meters) long. Surface dose rates ranged from 20 to 5000 millirads/hour. The cause of the rupture is listed in the radiation occurrence report as faulty supervisor judgment. The same line that failed in 1954 was mistakenly tested in 1966, causing liquid waste to surface again.
**Related Sites/Structures:** The site is a duplicate of UPR-200-W-97. The site is associated with UPR-200-W-29 because a repeat release from the same broken transfer line (documented in UPR-200-W-29 in 1954) occurred again in 1966.
**Waste Type:** Process Effluent
**Waste Description:** Contaminated second-cycle waste consisting of bismuth phosphate, with readings from 20 to 5,000 millirads/hour.

**Status:** Inactive
**Start Date:** 1/1/1972
**Classification:** Accepted
**Reclassification:** Rejected (7/28/2008)
**Description:** The release is not physically marked or posted.
**Location:** Contamination was found near the intersection of Dayton Avenue and 13th Street in 200 West Area.
**Release Description:** On February 8, 1972, beta-gamma contamination was found on the blacktop at the intersection of Dayton Avenue and 13th Street during a routine survey of 200 West Area roadways. Initial surveys revealed two spots on the roadway to a maximum of 4.5 rads/hour at 5.1 centimeters (2 inches). Extensive surveys made on the following shift discovered a stretch of road of about 30.5 meters (100 feet) with spotty contamination of 5,000 to 80,000 counts per minute (exclusive of previously-mentioned spots) on 13th Street and several spots ranging from 5,000 to 20,000 counts per minute on Dayton Avenue. One Hanford Patrol vehicle (HO-1A 2564)
had 10,000 counts per minute in the left rear fender well (which was promptly cleaned). The cause of the contamination was not conclusively determined. The most likely source of the contamination was dripping from an earlier transport of temperature probes from 241-SX Tank Farm to the burial ground.

**Waste Type:** Process Effluent

**Waste Description:** Beta/gamma contamination with readings from 5,000 to 80,000 counts/minute was found. Initial surveys revealed two spots to a maximum of 4.5 rads/hour at 5.1 centimeters (2 inches). Assumed to be from tank farm equipment being transported to burial ground.

**Code:** UPR-200-W-69

**Names:** UPR-200-W-69; Railroad Contamination; UN-200-W-69

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Rejected (5/13/2008)

**Start Date:** 1/1/1973

**End Date:**

**Description:** The contamination was identified in 1973. The area was bladed and released from Radiation Zone status in 1974. This Unplanned Release is no longer marked or posted.

**Location:** Contamination was identified north and northeast from the 204-S Unloading Station and between the 204-S railroad spur and the REDOX railroad cut.

**Release Description:** On March 2, 1973, a contamination status survey starting at the 204-S Unloading Station led to the discovery of a beta-gamma contamination spread north and northeast of the station. Numerous spots of ground contamination of 2,000 to 50,000 counts per minute were noted with infrequent spots of 20 to 100 millirads/hour. A spot measuring 5,000 millirads/hour was discovered near the railroad gate, outside the radiation zone. Inside the zone, the sump pit was found contaminated from 1,000 to 5,000 millirads/hour and the grating from the sump that was stacked nearby measured to 800 millirads/hour. The survey was extended outside the REDOX exclusion fence where several spots of 5,000 to 100,000 counts per minute (20 to 40 millirads/hour uncorrected) were detected between the 204-S railroad spur and the REDOX railroad cut embankment. The suspected cause of the ground contamination was high winds spreading material from a contaminated drain pit.

**Related Sites/Structures:** The site is associated with 200-W-22.

**Waste Type:** Stormwater Runoff

**Waste Description:** Beta/gamma contamination with readings from 2,000 to 50,000 counts/minute to 5,000 millirads/hour were measured at the railroad gate and from 5,000 to 100,000 counts/minute were measured outside the REDOX exclusion fence.

**Code:** UPR-200-W-72

**Names:** UPR-200-W-72; Contamination at 218-W-4A

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Consolidated (5/6/2004)

**Start Date:** 1/1/1975

**End Date:**

**Description:** This release site is not separately marked or posted. The release occurred inside the 218-W-4A Burial Ground.

**Location:** Contaminated waste was found on the ground surface within the 218-W-4A Burial Ground.
Release Description: On October 21, 1975, contaminated laboratory waste, with gross alpha and mixed fission product contamination, was found to be exposed to the surface. The waste had been buried years ago when depth of burial was only 1.2 meters (4 feet) below grade. It was speculated that this depth requirement was not met. Apparently, some soil erosion occurred which exposed the contaminated waste.

Related Sites/Structures: This release is associated with the 218-W-4A burial ground.

Waste Type: Stormwater Runoff

Waste Description: Gross alpha and mixed fission product with beta/gamma readings to 100,000 counts/minute and alpha readings to 70,000 disintegrations/minute were measured at the site.

Description: The site is a small area where flush solution from decontamination of a cooling waste effluent header was being pumped. Alpha contamination was found and cleaned up. The area is no longer marked or posted.

Location: The release occurred in an overground line, near the 241-Z-D-8 tank in 241-Z. The area is south of 234-5Z, inside the Z Plant security fence.

Release Description: On May 18, 1976, a small area of ground was contaminated at the surface with alpha activity when an overground polyethylene line leaked at a connection. About 20 square inches (129 centimeters) of ground was contaminated to a maximum of 8,000 disintegrations per minute. Flush solution from decontamination of the Reclamation facility cooling waste effluent header D-3 was being pumped according to Standard Operating Procedure from a tank located in manhole number 4 to tank D-8, 241-Z, through an overground polyethylene pipe. Approximately two minutes after the pumping was initiated a leak was noted at a connection within the greenhouse at manhole number 4. Pumping was immediately stopped and an inspection of the entire pumping route was completed. Solution was noted outside of the protective plastic that was taped around the pipe at a second connection outside of the greenhouse. The solution appeared to be contained by a secondary plastic sheet that the pipe was also wrapped in. During the release survey by Radiation Monitoring following cleanup of this solution, the small area of contaminated ground was found.

Waste Type: Steam Condensate

Waste Description: Alpha contamination with maximum readings of 8,000 disintegrations/minute.

**Description:** Alpha contamination was spread inside and outside of the 241-Z Sump radiation zone fence. The area was decontaminated and is no longer marked or posted. It occurred in the graveled and concrete area around the 241-Z Building.

**Location:** The release occurred at the 241-Z area, south of the 234-5Z building, and inside the 234-5Z exclusion fence.

**Release Description:** On October 6, 1978, contamination was detected due to the failure of the pH line at the 241-Z Sump. During replacement of steam valves and lines at the 241-Z Sump D-7 and D-8 sample cabinets, Radiation Monitoring detected alpha contamination in excess of 40,000 disintegrations per minute on an out of service pH control line behind the D-8 sample cabinet. Other locations which were contaminated in excess of 40,000 disintegrations per minute included the concrete pad under the D-7 and D-8 sample cabinets, and the steam line to the sample cabinets. Ground contamination of a five-foot square dirt area under the pH meter lines and another five-foot square dirt area north of the D-7 and D-8 sample cabinets outside of the 241-Z Sump radiation zone fence was detected. Alpha contamination was detected up to 2,000 disintegrations per minute under the pH lines and up to 500 disintegrations per minute outside the fence area. The apparent cause of the contamination was the failure of the pH line due to normal deterioration. The line had not been used or worked on for many years.

**Related Sites/Structures:** The area is associated with UPR-200-W-75.

**Waste Type:** Process Effluent

**Waste Description:** Alpha contamination with readings from 500 to 2,000 disintegrations per minute was detected behind the 241-Z "D-8" sample cabinet. Alpha contamination in excess of 40,000 disintegrations per minute was detected on the pH line, concrete pad, soil and steam line.

**Status:** Inactive

**Start Date:** 1/1/1978

**End Date:** 1/1/1978

**Description:** The 241-S/SX Tank Farms are surrounded with a chain link fence and posted with radiological warning signs. The unplanned release is not separately marked or posted.

**Location:** Contamination was found near the 244-S Catch Station construction site and other areas inside the 241-S and 241-SX Tank Farms.

**Release Description:** The contamination resulted from windborne contaminated soil and removable surface contamination in the 241-S and 241-SX Tank Farms, possibly from leaking vent lines or an old spill area that was not adequately stabilized.

**Related Sites/Structures:** UPR-200-W-80 was associated with the 244-S Catch Station construction site, the 241-S and the 241-SX Tank Farms.

**Waste Type:** Stormwater Runoff
**Waste Description:** Laboratory analysis of some of the contamination found contained 1.4 microcuries of strontium-90 and a trace amount of cesium-137 with maximum readings of 60,000 counts per minute.

**This Site Was Consolidated With:**

**Type:** Unplanned Release  
**Status:** Inactive  
**Description:** The tank farm is surrounded with a chain link fence and posted with radiological warning signs. The unplanned release is not separately marked or posted.

**Location:** The release site was located on the ground between the 241-S Tank Farm and the 241-SX Tank Farms, inside the fence.

**Release Description:** A radiation survey of the area on December 22, 1978, revealed contamination in the form of specks reading from 500 to greater than 100,000 counts per minute on the ground between 241-S and 241-SX Tank Farms. The occurrence report was issued in January 1979, citing loose surface contamination as the cause of the contamination migration.

**Related Sites/Structures:** UPR-200-W-81 is associated with the 241-S and 241-SX Tank Farm operations.

**Waste Type:** Stormwater Runoff  
**Waste Description:** The release consisted of airborne contamination from surface contaminated tank farm equipment. Contamination readings ranged from 500 to more than 100,000 counts per minute.

**Type:** Unplanned Release  
**Status:** Inactive  
**Description:** The unloading station was decontaminated and decommissioned in December 1983. The area where this release occurred is located inside a posted Underground Radioactive Material Area. The release site is co-located with WIDS sitecode 200-W-22.

**Location:** UPR-200-W-83 occurred on the step-off pad (outside the 204-S radiation area), at the 204-S Railroad Car Unloading Facility, which was located south of the 204-S Foundation and north of the 203-S Basin in the 200 West Area.

**Release Description:** The release occurred at the 204-S Railroad Car Unloading Facility. The release contaminated the step-off pad outside the 204-S radiation zone at the 204-S Unloading Facility. Improper handling of contaminated trash was the primary cause of the contamination spread.
Immediately after the release, the site was secured, stabilized, and decontamination was initiated.

**Related Sites/Structures:** UPR-200-W-83 was associated with the 204-S Railroad Car Unloading Facility, the 203-S, 204-S, and 205-S facilities and sitecode 200-W-22.

**Process Description:** Radioactive liquid was transported to the Unloading Station in railroad tank cars.

**Waste Type:** Equipment

**Waste Description:** The waste had an unknown amount of radioactive contamination.

**Names:** UPR-200-W-84; Ground Contamination During Burial Operation at 218-W-3A

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Consolidated (7/14/2004)

**Start Date:** 1/1/1980

**End Date:** 1/1/1980

**Description:** The release occurred inside the boundaries of an established burial ground. The release is not separately marked or posted.

**Location:** The release site occurred at the 218-W-3A Burial Ground, which is located on Dayton Ave., northeast of the 200 West Central Waste Complex.

**Release Description:** On July 23, 1980, a liquid spill occurred during a pump burial. Liquid from the pump contaminated the truck and the ground around the truck.

**Related Sites/Structures:** UPR-200-W-84 was associated with the 200 West Area Burial Ground (assumed to be 218-W-3A).

**Waste Type:** Process Effluent

**Waste Description:** The waste had beta and gamma contamination with readings up to 2,000 millirads/hour.

**Code:** UPR-200-W-85

**Names:** UPR-200-W-85; Radioactive Spill from Multipurpose Transfer Box; UN-200-W-85; UN-216-W-85

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** Rejected (7/28/2008)

**Start Date:** 1/1/1982

**End Date:** 1/1/1982

**Description:** The site where UPR-200-W-85 occurred is a concrete pad west of the 2706-T building. A 1998 site visit found a new equipment decontamination and waste handling building (2706-TA) has
been built on this concrete pad. The concrete pad was sealed with an epoxy coating. The building entry is posted as FCA-2706-002. The release site is not marked or posted.

**Location:** UPR-200-W-85 occurred west of the 2706-T Building, which lies northwest of the 221-T Canyon Building in the 200 West Area.

**Release Description:** In April 1982, a multi-purpose transfer box was moved from the 221-T railroad cut to the cement pad behind the 2706-T Building. While parked on the pad, liquid was observed dripping from the box. The apparent cause of the leak was a weld failure on the outside sheathing covering the concrete shell. Contamination levels up to 100,000 counts per minute were found on the ground. The contamination was cleaned up at the 2706-T pad area. The railroad track from the 2706-T Building to the 221-T railroad cut was surveyed and no contamination was detected.

**Related Sites/Structures:** UPR-200-W-85 was associated with a concrete pad behind the 2706-T Building, and the railroad tracks between the 2706-T Building and the 221-T railroad cut.

**Waste Type:** Water

**Waste Description:** The contents of the multi-purpose box is not known. The radiological reading on the spill was 100,000 counts per minute beta/gamma.

---

**Code:** UPR-200-W-86

**Classification:** Accepted

**Names:** UPR-200-W-86; Contaminated Pigeon Feces at 221-U and 204-S; UN-200-W-86; UN-216-W-86

**Reclassification:** Rejected (1/3/2008)

**Type:** Unplanned Release

**Start Date:** 1/1/1981

**End Date:** 1/1/1981

**Description:** No physical posting or markers currently identify this unplanned release.

**Location:** Contamination was found around 221-U Building and the 204-S Waste Unloading Facility.

**Release Description:** In 1981, contaminated pigeon feces were found at several facilities in 200 West Area. The largest amount of contaminated bird feces, as well as the highest levels of contamination, were found at 221-U and near 204-S. The source of the contamination was determined to be the contaminated water accumulating in the 204-S tank basin. The contamination that prompted this occurrence report (81-72) was found and reported on October 27, 1981.

**Related Sites/Structures:** The release is mainly associated with the 204-S facility and 221-U.

**Waste Type:** Process Effluent

**Waste Description:** The contamination consisted of pigeon feces containing cesium-134, cesium-137, strontium-90, and ruthenium-106, with readings ranging from 10,000 disintegrations per minute (beta/gamma) to 40 millirad/hour.

---

**Code:** UPR-200-W-87

**Classification:** Accepted

**Names:** UPR-200-W-87; Radioactive Spill from 219-S Filter Housing; UN-200-W-87; UN-216-W-87

**Reclassification:** Rejected (7/28/2008)

**Type:** Unplanned Release

**Start Date:** 1/1/1982

**End Date:** 1/1/1982

**Description:** The release site is 2.7 square meters (30 square feet) of ground at the 219-S High Efficiency
Particulate Air (HEPA) filter housing. In January 2002, work began on installing a new concrete pad to support a replacement filter housing.

**Location:** UPR-200-W-87 occurred at the 219-S High Efficiency Particulate Air (HEPA) filter housing, which lies northeast of the 222-S Laboratory in the 200 West Area.

**Release Description:** Water was being blown from the 219-S High Efficiency filter box up the exhaust stack. The smear of the liquid revealed no contamination. The decision was made to change the High Efficiency filter. The 219-S High Efficiency Particulate Air (HEPA) filter housing was opened for the filter change. As the coverplate bolts were removed, water began to run from the housing. The flow continued until it covered approximately 2.7 square meters (30 square feet). After the water soaked into the ground, 2,000 counts per minute beta gamma was found under the filter box, with 300 counts per minute on the remaining damp soil.

**Related Sites/Structures:** UPR-200-W-87 was associated with the 219-S High Efficiency filter housing.

**Waste Type:** Process Effluent

**Waste Description:** The waste was contaminated water containing beta and gamma contamination with readings from 300 to 2,000 counts per minute.

---

**Code:** UPR-200-W-88

**Classification:** Not Accepted

**Reclassification:** None

**Names:** UPR-200-W-88; Radioactive Spill from Uranyl Nitrate (UNH) Trailer; UN-200-W-88; UN-216W-88

**Type:** Unplanned Release

**Start Date:** 1/1/1984

**End Date:** 1/1/1984

**Description:** This release occurred on a roadway and was cleaned up right away. It was not marked or posted.

**Location:** Road contamination was identified in two places along the uranyl nitrate trailer route. A small amount of contamination reading 800 counts per minute was found on the roadway inside the 200 West Area Main Gate. Three other small spots reading up to 650 counts per minute were found near the stop sign at the intersection of Route 3 and Route 4N.

**Release Description:** Contaminated liquid was discovered in the loadout cupola of the uranyl nitrate trailer when it returned to PUREX after transporting a load of uranyl nitrate to 224-U. Follow up surveys were made at stop points along the transfer route where "sloshing" of liquid may have occurred. Two areas of contamination were found along the transfer route. The contamination found on the roadway was removed.

**Related Sites/Structures:** UPR-200-W-88 was associated with a section of roadway inside the 200 West main gate, the intersection of Route 3 and Route 4N.

**Process Description:** Uranyl nitrate was routinely transported from PUREX in 200 East Area to 224-U in 200 West Area in tanker trucks.

**Waste Type:** Ash

**Waste Description:** The waste had beta and gamma contamination with readings from 300 to 650 counts per minute.

*Hanford Site Waste Management Units Report*
February 2015
W-91

Type: Unplanned Release
Status: Inactive

Start Date: 1/1/1985
End Date: 1/1/1985

Description: UPR-200-W-91 contaminated an area of ground on the north side of the 234-5Z Building. The release site was covered with snow and ice, so it was contained with plastic and roped off until it could be decontaminated. The final decontamination record could not be found. It is not currently marked or posted.

Location: UPR-200-W-91 occurred in an area adjacent to the north side of the 234-5Z Building, at Z Plant in the 200 West Area.

Release Description: The release occurred on December 11, 1985. A pallet jack was being used to transport a supposedly empty can from a storage area to the 234-5Z Building. While traveling over the ice and snow, the can overturned and liquid alpha contamination spilled to the ground between the lid and gasket. The area was covered with plastic and decontaminated to 2,000 disintegrations per minute. The total contaminated area was reported as 0.6 meters by 1.8 meters (2 feet by 6 feet).

Related Sites/Structures: UPR-200-W-91 was associated with the 234-5Z Building.

Waste Type: Process Effluent

Waste Description: The waste contained alpha contamination with readings up to 20,000 disintegrations per minute.

Code: UPR-200-W-95
Classification: Accepted
Reclassification: Consolidated (1/25/2000)

Names: UPR-200-W-95; 207-S Retention Basin; UN-216-W-2

Type: Unplanned Release
Status: Inactive

Start Date: 1/1/1951
End Date: 1/1/1954

Description: The site is a liquid unplanned release that contaminated the 207-S Retention Basin. The retention basin has been backfilled and surface stabilized. The basin is marked and posted with Underground Radioactive Material signs. The release is not separately marked or posted. The unplanned release has been consolidated with the 207-S site.

Location: The 207-S Retention Basin is located approximately 366 meters (1,200 feet) due west of the 222-S Building in the 200 West Area.

Release Description: Multiple coil leaks in the 202-S Building resulted in contamination of the cooling water discharged to the 207-S Retention Basin. In November 1952, dose rates of 250 milirem per hour were recorded at a distance of 1.5 meters (5 feet) above the basin water. In August 1953, maximum dose rates up to 350 millirem per hour were found over the retention basin outlet header. In September 1953, the dose rate in the basin rose to 2 rad per hour. In 1954, the contaminated concrete basin was filled with soil to prevent the contamination from spreading.

Related Sites/Structures: The site is associated with the 202-S facility and the 207-S Retention Basin.

Process Description: Process cooling water and stem condensate was routinely discharged to the 207-S Retention Basin before being sent to other waste disposal sites.

Waste Type: Storage Tank
Waste Description: The basin has been contaminated with approximately 10 curies of fission products.

**This Site Was Consolidated With:**
- Code: 207-S
- Names: 207-S; 207-S Retention Basin; REDOX Retention Basin

**Code:** UPR-200-W-100  **Classification:** Accepted
**Names:** UPR-200-W-100; 105-TX to 118-TX Process Line Leak; UN-200-W-100; UN-216-W-8  **Reclassification:** Consolidated (6/13/2002)
**Type:** Unplanned Release  **Start Date:** 1/1/1954
**Status:** Inactive  **End Date:** 1/1/1954
**Description:** The release occurred inside the 241-TX Tank Farm. The tank farm is surrounded with a chain link fence and has been stabilized with gravel. The release is not separately marked or posted.
**Location:** The location of this Unplanned Release is difficult to define due to discrepancies in reference documentation. The most reliable reference, ARH-2757, places the release inside the 241-TX Tank Farm fence, east of the 241-TX-105 tank.
**Release Description:** First cycle waste was discovered leaking from a waste transfer line in November 1954. The maximum dose rate was 4.5 rad per hour at a distance of 1.2 meters (4 feet). The liquid release covered an area of approximately 30 by 38 meters (100 by 125 feet).
**Related Sites/Structures:** UPR-200-W-100 is associated with the 241-TX-105 and 241-TX-108 tanks and the 241-TX Tank Farm.
**Waste Type:** Barrels/Drums/Buckets/Cans
**Waste Description:** The release consisted of first-cycle, high-salt, neutral to basic waste containing fission products with a maximum dose rate of 4.5 rad per hour at a distance of 1.2 meters (4 feet). The waste contained approximately 10 curies of fission products.

**This Site Was Consolidated With:**
- Code: 200-W-94
- Names: 200-W-94; Contaminated Soil at 241-TX/TY Tank Farm

**Code:** UPR-200-W-104  **Classification:** Accepted
**Names:** UPR-200-W-104; 216-U-10 Pond Leach Trench; U Pond Fingers; UN-216-W-14  **Reclassification:** Consolidated (1/25/2000)
**Type:** Unplanned Release  **Start Date:**
**Status:** Inactive  **End Date:**
**Description:** The site is historically identified as an unplanned release. The site is posted with "Underground Radioactive Material" warning signs. The leach trenches were stabilized along with the 216-U-10 Pond. The AC-540 markers at the ends of the trenches are labeled 216-U-10 and URM. This site has been consolidated with the 216-U-10 Pond.
**Location:** The release site runs northwest from the northeast corner of the 216-U-10 Pond.
**Related Sites/Structures:** UPR-200-W-104 was associated with the 216-U-10 Pond.
**Process Description:**
The trench was dug to provide additional leaching area for 216-U-10 Pond overflow water.

**Waste Type:** Soil

**Waste Description:**
A trench was dug to give additional leaching surface for overflow water from the 216-U-10 Pond. There is low-level, beta/gamma and alpha activity in the bottom of the leach trench. Contaminants of concern include cesium-137, americium-241, cerium-144 and potassium-40.

**This Site Was Consolidated With:**
- **Code:** 216-U-10
- **Names:** 216-U-10; 216-U-10 Pond; 231 Swamp; U Swamp; 216-U-1

</table>
**Type:** Unplanned Release  
**Start Date:** 1/1/1979

**Status:** Inactive  
**End Date:** 1/1/1979

**Description:** The 204-S Unloading Station was decontaminated and dismantled in 1983. The entire 204-S/205-S area, including the dismantled railcar Unloading Station, was decommissioned and covered with clean backfill material. This Unplanned Release is not separately marked or posted. The location lies beneath the stabilization cover.

**Location:** UPR-200-W-123 occurred at the 204-S Unloading Station, which was located south of the 204-S Tank Farm and north of the 203-S Basin, in the 200 West Area.

**Release Description:** On January 18, 1979, the 204-S Unloading Station received railroad tank car number 18579 from the 300 Area with a total load of 73,050 liters (19,300 gallons) of radioactive liquid waste. Operators connected to the tank car and made three attempts to prime the car. During the third attempt, the pressure relief valve actuated, releasing a small amount of material into the plastic containment and then leaking down the side of the car onto the ground. The apparent cause for the occurrence was a frozen discharge line below the primer tank.

**Related Sites/Structures:** UPR-200-W-123 is associated with the 204-S Unloading Facility Area and 200-W-22.

**Waste Type:** Process Effluent

**Waste Description:** The release consisted of radioactive liquid waste from the 300 Area.

**Type:** Trench  
**Start Date:** 1/1/1956

**Status:** Inactive  
**End Date:**

**Description:** WIDS site UPR-200-W-125 has been reclassified based on documentation that verified it was a DUPLICATE of 216-U-15. Future updates and closeout information will only be added to 216-U-15. This site will no longer be updated. The site was a one-time use waste disposal unit. A hole was dug in the ground and the material dumped and covered. Contamination was limited to a hole in the ground (which included interface crud, activated charcoal, and diatomaceous earth) near U Plant.

**Location:** The site is located in the 200 West Area, west of 221-U.

**Release Description:** The site resulted from a leak in the transfer line from the 200-U Tank (388-U Tank). This statement appeared in the original WIDS files, it is not traceable to a reference.

**Related Sites/Structures:** This is a Duplicate record of 216-U-15.

**Waste Type:** Process Effluent

**Waste Description:** The waste was 26,500 liters (7000 gallons) of interface crud, activated charcoal, and diatomaceous earth, containing about one curie of fission products.

**Description:** The tank farm that is surrounded by a chain link fence and is posted with radiological warning signs, including Underground Radioactive Material, Radiation Area, Fixed Contamination Area, Radiological Buffer Area and Radioactive Material Area. The release site is not separately marked of posted.

**Location:** UPR-200-W-126 occurred at the 241-TX-153 Diversion Box, inside the 241-TX Tank Farm, southeast of the 241-TX-101 Tank.

**Release Description:** While removing old gaskets on an over-ground transfer line from the 241-TX-153 Diversion Box to the 241-TX-101 Tank, a pipe fitter and an operator became contaminated. As the gaskets were being placed into a plastic bag, spotty contamination became airborne. Both employees had approximately 2000 counts per minute on their faces.

**Related Sites/Structures:** UPR-200-W-126 is associated with the 241-TX-153 Diversion Box and the 241-TX-101 Tank.

**Waste Type:** Equipment

**Waste Description:** Spotty contamination became airborne. The employee received contamination levels reading up to 2,000 counts per minute.

**Description:** The site was a pool of liquid that was covered with clean dirt located inside the tank farm fence, on the east side of the evaporator building. In June 2001, a gravel pile was noted near where the release occurred, but the area is not specifically marked or separately posted.

**Location:** UPR-200-W-127 occurred on the east side of the 242-S Evaporator Building, inside the 241-S Tank Farm fence.

**Release Description:** At approximately 5:30 on the morning of February 26, 1980, a radiation area detector (Area Radiation Monitor) sounded and notified the building operator of an elevated dose rate in the 241-S Tank Farm. The operator left the building to investigate and found a pool of liquid on the ground surface, on the east side of the 242-S Evaporator building. The operator
immediately left the area. A Radiation Monitor arrived and determined that high radiation levels existed all around the building. Barricades were set up to restrict access to the area.

**Related Sites/Structures:**

UPR-200-W-127 is associated with the 241-S Tank Farm.

**Waste Type:** Equipment

**Waste Description:** The release was an unknown liquid associated with the 241-S Tank Farm.

**This Site Was Consolidated With:**

### UPR-200-W-128

**Code:** UPR-200-W-128

**Classification:** Accepted

**Names:** UPR-200-W-128; Contamination Release Inside 241-U Tank Farm

**Reclassification:** Consolidated (6/13/2002)

**Type:** Unplanned Release

**Start Date:** 1/1/1971

**End Date:** 1/1/1971

**Description:** The release occurred inside the tank farm fence, adjacent to the 241-U-103 Tank. The release is not separately marked or posted.

**Location:** UPR-200-W-128 occurred at the 241-U-103 Tank, located inside the 241-U Tank Farm.

**Release Description:** The Radiation Incident Report states that an employee cut through a waste line, located in the 241-U-103 Tank pit. The incident resulted in contamination of two employees and their surroundings. Their skin, clothes and hair were contaminated with levels ranging from 3000 to 20,000 counts per minute.

**Related Sites/Structures:** UPR-200-W-128 is associated with the 241-U-103 Tank and the 241-U Tank Farm.

**Waste Type:** Process Effluent

**Waste Description:** The release consisted of liquid waste contaminated with fission products.

**This Site Was Consolidated With:**

**Code:** 200-W-95

**Names:** 200-W-95; Contaminated Soil at 241-U Tank Farm; Contamination Migration Beyond the 241-U fence

---

### UPR-200-W-129

**Code:** UPR-200-W-129

**Classification:** Accepted

**Names:** UPR-200-W-129; Contamination Release Inside 241-TX Tank Farm

**Reclassification:** Consolidated (6/13/2002)

**Type:** Unplanned Release

**Start Date:** 1/1/1971

**End Date:** 1/1/1971

**Description:** The personnel contamination incident release occurred inside the fenced 241-TX Tank Farm. The release site is not separately marked or posted.

**Location:** UPR-200-W-129 occurred at the 241-TX-113 Pump Pit, located inside the 241-TX Tank Farm.

| Description | The release occurred inside the fenced 241-U Tank Farm. The area around the 241-UR-151 Diversion Box has been covered with shotcrete. The release is not separately marked or posted. |
| Location | UPR-200-W-132 occurred inside the 241-U Tank Farm, near the 241-UR-151 Diversion Box and the 254-UR Electrical Substation (adjacent to the 271-U Control Building). |
| Release Description | An operator working inside the 271-UR Control Building noticed an elevated background reading and an off scale reading on the panel board. He notified his supervisor, shut down operating equipment and evacuated the building. While leaving, he and a co-worker noticed a gurgling sound and observed two pools of liquid forming around the 241-UR-151 Diversion Box. One pool was approximately 1.8 meters by 6 meters (6 by 20 feet), the other was approximately 4.5 meters by 9 meters (15 by 30 feet). Dose rates taken from 3 meters (10 feet) away from the pools measured up to 10 rad per hour beta/gamma and 500 millirem per hour gamma. |

**Description:** The improper burial of a drum containing transuranic material occurred was at the 218-W-3A Burial Ground. The burial trench has been covered with clean soil. This Unplanned Release site is not separately marked or posted.

**Location:** UPR-200-W-134 occurred at the 218-W-3A Burial Ground, in the 200 West Area.

**Release Description:** A waste drum from the 325 building, labeled TRANSURANIC, was improperly buried and documented on Occurrence Report 38-75. It contained 18.6 grams of plutonium, 2466 grams of uranium and a total of 53 grams of fissile material. The handling and storage of this material did not meet applicable standards. The drum was dumped into the burial trench and covered with several other loads of radioactive waste and approximately 2.4 meters (8 feet) of clean soil.

**Related Sites/Structures:** UPR-200-W-134 was associated with the 218-W-3A Burial Ground.

**Waste Type:** Equipment

**Waste Description:** The transuranic waste in the drum contained 18.6 grams of plutonium, 2466 grams of uranium and a total of 53 grams (2 ounces) of fissile material.

**Status:** Inactive  
**End Date:**

**Description:** A vent from the vault is visible above the ground surface; the rest of the site is graveled and surrounded by yellow metal poles and a chain to mark the radiation zone.

**Location:** The site is located in the 200 West Area. It is in a vault east of the 222-S Building.

**Process Description:** The site received dry, packaged laboratory and sampler wastes from the 222-S Building.

### This Site Was Consolidated With:

**Code:** 218-W-7  
**Names:** 218-W-7; 222-S Vault

---

**Code:** UPR-200-W-139  
**Classification:** Accepted

**Names:** UPR-200-W-139; UPR-200-W-18; Liquid Release to the 216-U-9 Ditch; UN-200-W-139  
**Reclassification:** Consolidated (1/25/2000)

**Type:** Unplanned Release  
**Start Date:** 1/1/1953  
**End Date:** 1/1/1954

**Description:** WIDS site UPR-200-W-139 was located within the boundary of the larger site of 216-U-9 Ditch and has been consolidated into that site. Future updates and closeout information will only be added to 216-U-9 Ditch. This site will no longer be updated. The site was an unplanned release into the eastern fork of the 216-U-9 Ditch. The eastern fork of the 216-U-9 Ditch is visible above the ground surface.
Ditch was abandoned in 1954. Currently, the eastern fork of the ditch is not marked or posted. It has no chain barricades or radiation warning signs and is partially backfilled. There are no permanent monuments or other identifiers at the site. The head end of the 216-U-9 Ditch, beginning south of 13th Street, is still an open, dry ditch. There is mature sage brush growing on the side slopes of the open ditch.

**Location:** UPR-200-W-139 occurred within the eastern fork of the 216-U-9 Ditch. The ditch lies southwest of the 241-SX Tank Farm, outside of the 200 West Area perimeter fence.

**Release Description:** Contamination from an unknown source was detected in the 216-U-9 Ditch in September 1953. In the spring of 1954, the contamination was covered with 0.6 meters (2 feet) of clean soil. It was designated as a radiation zone and posted with Underground Radioactive Material signs. No mention is found in the records regarding the level of contamination.

**Related Sites/Structures:** UPR-200-W-139 was associated with the 216-U-9 Ditch.

**Process Description:** The 216-U-9 Ditch received overflow from the 216-U-10 Pond. The release site was within the eastern fork of the 216-U-9 Ditch. The ditch connected the 216-U-10 Pond with the 216-S-17 Pond. The 216-U-9 Ditch was released from radiation zone status in 1969. In 1973, a portion of the 216-U-9 Ditch was reopened and reused to connect the 216-U-10 Pond overflow to the 216-S-16 Pond. The first 152.50 meters (500 feet) of the original 216-U-9 Ditch were reused.

**Waste Type:** Soil

**Waste Description:** References state the ditch became contaminated in September of 1953 and was backfilled in spring of 1954. No details of the release are included.

**This Site Was Consolidated With:**

**Code:** 216-U-9

**Names:** 216-U-9; U Swamp-S Swamp Ditch; 216-U-6

---

**UPR-200-W-140**

**Classification:** Accepted

**Reclassification:** Consolidated (6/13/2002)

**Start Date:** 1/1/1956

**End Date:** 1/1/1964

**Description:** The release is the soil beneath the 241-SX-107 Tank. The release is not separately marked or posted.

**Location:** The release occurred beneath the 241-SX-107 Tank, inside the 241-SX Tank Farm.

**Release Description:** UPR-200-W-140 occurred over time, as high-level waste leaked into the soil beneath the 241-SX-107 Tank. The waste spread in a geologic strata 17 to 18 meters (55 to 60 feet) below ground surface.

**Related Sites/Structures:** UPR-200-W-140 is associated with the 241-SX-107 Tank and the 241-SX Tank Farm.

**Waste Type:** Process Effluent

**Waste Description:** The release consisted of REDOX high-level wastes and REDOX coating wastes.

**This Site Was Consolidated With:**
Code: 200-W-96
Names: 200-W-96; Contaminated Soil at 241-S/SX/SY Tank Farm

Code: UPR-200-W-141
Names: UPR-200-W-141; 241-SX-108 Leak

Hanford Site Waste Management Units Report
February 2015
Status: Inactive
End Date: 

Description: The release is the soil under the 241-T-103 Tank. It is not separately marked or posted.

Location: The release is located southeast of the 241-T-103 Tank, inside the 241-T Tank Farm.

Release Description: In 1973, while monitoring wells were being drilled to assess the 241-T-106 tank leak, contamination was identified between monitoring wells 299-W10-116 and 299-W10-118. This contamination plume was determined to be from the 241-T-103 Tank. Subsequent investigations revealed that the leak resulted from a failed grout seal in a spare entry line to 214-T-103.

Related Sites/Structures: UPR-200-W-147 is associated with the 241-T-103 Tank.

Waste Type: Equipment

Waste Description: In 1973, the release contained 1 microcurie/liter of ruthenium.

This Site Was Consolidated With:

Code: 200-W-93
Names: 200-W-93; Contaminated Soil at 241-T Tank Farm

Description: The release is the soil underneath and adjacent to the 241-T-106 Tank. The release is not separately marked or posted.

Location: The release is a contaminated soil plume located adjacent to the 241-T-106 tank, inside the 241-T Tank Farm.

Release Description: The release occurred during a routine tank filling operation. From January 1973 to April 4, 1973, the liquid level in 241-T-106 was stable at 61 centimeters (24 inches). On April 4, 1973, the contents of tank 241-T-107 began being transferred to 241-T-106. Liquid level readings were taken three times per shift during the transfer operations. When the pumping operation stopped on April 24, 1973, the liquid level reading was 445.5 centimeters (175.4 inches). Due to the tank cascading effect, the liquid level continued to rise after the pumping ended, with a maximum liquid level of 466.5 centimeters (183.7 inches) being recorded on April 25, 1973. The first routine, weekly liquid level measurement was taken on May 2, 1973 and recorded a level of 454.4 centimeters (178.9 inches). The liquid level was entered into the logbook. A week later, the routine measurement was recorded in the logbook at 442 centimeters (174 inches). On May 14, 1973 the weekly liquid level of 426.4 centimeters (167.9 inches) was recorded in the logbook. The shift supervisor did not review the logbook but did prepare a Tank Inventory Form and transmit it to the Process Control Group. Because Tank Inventory forms for the previous two weeks were missing, they could only compare the liquid level to the last form transmitted, which was for April 23, 1973 with a liquid level of 389.9 centimeters (153.5 inches), taken during the pumping operations. The missing data caused the diminishing tank levels to go unnoticed. By June 1, 1973, high readings were being identified in dry well 299-W10-51 and the routine weekly liquid level for June 4th was down to 378.9 centimeters (149.2 inches). On June 7, 1973 the tank data was reviewed and determined to be leaking. Emergency plans were made to pump the remaining liquid out of tank 241-T-106.
**Related Sites/Structures:**
UPR-200-W-148 is associated with the 241-T-106 Tank and the 241-T Tank Farm.

**Process Description:**
This release occurred while waste was being transferred from the 241-T-107 tank to 241-T-106 tank (which is the last tank in the T-104, T-105, T-106 cascading tank series). Since 241-T-104 contained a large amount of solid salt cake, the waste was pumped from 241-T-107 to 241-T-105, which overflowed into 241-T-106.

**Waste Type:**
Equipment

**Waste Description:**
At the time the release occurred, the tank contained waste with approximately 40,000 curies of cesium-137, 14,000 curies of strontium-90, 4 curies of plutonium, and various fission products.

**Description:**
The release is the soil adjacent to the 241-TX-107 Tank. The release is not separately marked or posted.

**Location:**
The release is located in the soil south of the 241-TX-107 Tank, inside the 241-TX-Tank Farm.

**Release Description:**
Elevated radiation readings were recorded in dry wells 51-07-01, 51-03-12, 51-03-11, 51-07-18 and 51-03-01 during 1977 resulting in several Occurrence Reports to be issued. After extensive studies it was concluded that the source of the high-level activity detected in dry well 51-07-18 may have been liquid from the 241-TX-107 Tank.

**Related Sites/Structures:**
UPR-200-W-149 is associated with the 241-TX-107 Tank and Dry Well 51-07-18.

**Waste Type:**
Equipment

**Waste Description:**
Assuming the waste came from 241-TX-107, the release would contain bismuth phosphate metal waste, REDOX high-level waste, and evaporator bottoms from the 242-T Evaporator.

</table>
Release Description: Two dry wells, 52-03-05 and 52-03-06 showed slowing increasing radiological readings in 1974. The activity in these dry wells may be an indication of interstitial liquid seepage from the 241-TY-105 Tank. Occurrence Reports 74-101 and 74-102 were issued in June 1974 to document the findings.

Related Sites/Structures: UPR-200-W-152 was associated with the 241-TY-105 Tank.

Waste Type: Process Effluent

Waste Description: The release consisted of tributyl phosphate containing 4,000 curies of cesium-137.

Location: The release is the soil under and adjacent to the 241-U-101 Tank. The release is not separately marked or posted.

Release Description: Routine surveillance of Dry Well 52-06-05, in 1974, showed a slow increase in radioactivity over a six month span, indicating interstitial liquids were seeping from tanks 241-TY-106 or 241-TY-105. The release occurred over time, from routine tank use. Occurrence Report 74-88 was issued to document the findings.

Related Sites/Structures: The release is associated with the 241-TY Tank Farm and tank 241-TY-106.

Waste Type: Storage Tank

Waste Description: The release consisted of tributyl phosphate process waste.

| Description: | The release site was the soil adjacent to the Plutonium Finishing Plant. The soil that was contaminated with sodium hydroxide was disposed of as hazardous waste. The site is not marked or posted. |
Location: UPR-200-W-159 occurred in the soil adjacent to the Plutonium Finishing Plant, inside the facility security fence.

Release Description: UPR-200-W-159 occurred when an unknown amount of 50% aqueous sodium hydroxide, a corrosive liquid, was spilled to ground near the Plutonium Finishing Plant.

Related Sites/Structures: UPR-200-W-159 was associated with the Plutonium Finishing Plant.

Waste Type: Equipment

Waste Description: The release consisted of an unknown amount of 50% aqueous sodium hydroxide.

<tr>
<td>Location:</td>
<td>The release location is the area around the 241-TX-154 Diversion Box and the 241-TX-302 Catch Tank, and between the 221-T Building and the 222-T Building, near section R-11 of 221-T.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Release Description:</td>
<td>The release consisted of highly radioactive liquid waste due to failure of an underground line during a waste transfer from the 241-TX-302C Catch Tank. A pool of liquid waste with a high dose rate was identified on the surface near the 241-TX-302 Catch Tank (December 30, 1955). It was estimated that several thousand gallons of &quot;metal&quot; waste and rain water had been released to the ground. The area was backfilled, sprayed with tar, and posted as a radiation zone in 1956. During April and May 1968, the east side of the radiation zone was cut back a distance of 10 ft (3.0 m). Thin concrete cell cover blocks were leaned at a 60-degree angle against the side of the cut to shield the dose rates to acceptable levels.</td>
<td></td>

**Status:** Inactive   
**End Date:**

**Description:** The release consisted of radiologically contaminated vegetation growing above the underground pipeline to the 216-U-8 crib (the pipeline is sitecode 200-W-42). The area is currently posted with Underground Radioactive Material signs.

The 200-W-42 pipeline is the source of this unplanned release. The remediation of the pipeline will include the soil above it. This UPR was consolidated into 200-W-42. A large portion of the pipeline and contaminated soil was removed in 2006.

**Location:** The release site is located in the soil above the pipeline from the 224-U building to the 216-U-8 Crib. Posted Underground Radioactive Material areas are located on the north and south sides of 16th Street. The pipeline is west of Beloit Ave.

**Release Description:** UPR-200-W-163 occurred over time, as leaking waste from the underground pipeline contaminated the soil. Growing vegetation absorbed some of the radioactive contaminants. Broken pieces of contaminated vegetation scattered in the wind and caused the size of the surface posted contamination area to be increased.

**Related Sites/Structures:** UPR-200-W-163 is associated with the vitrified clay pipeline (200-W-42-PL) connecting the 216-U-8 Crib to the 224-U Building. The posted area over the pipeline on the north side of 16th Street was stabilized in October 2001.

**Process Description:** The vitrified clay underground pipeline transferred U Plant waste to the 216-U-8 crib.

**Waste Type:** Process Effluent

**Waste Description:** The waste in the pipeline consisted of process condensate from the 224-U Building. The waste was acidic.

**Code:** UPR-300-7  
**Classification:** Accepted

**Names:** UPR-300-7; Oil Spill at 384 Building; UN-300-7  
**Reclassification:** Closed Out (8/24/1999)

**Type:** Unplanned Release  
**Start Date:** 1/1/1972  
**End Date:** 1/1/1972

**Description:** The waste site was an oil release the ground and concrete valve pits around the underground day tanks located behind the 384 Building (300 Area Powerhouse). The area is paved with asphalt. There was no visual evidence of a spill. Most of the spilled oil was contained in the underground, concrete pits that surround the day tanks.

This site was closed out in conjunction with the North Process Pond.

**Location:** The release occurred on the north side of the 384 Powerhouse, adjacent to the day tanks, but a portion of the spill was sent to the North Process Pond. The day tanks and adjacent oil-contaminated soil have been removed (see site code 300-223).

**Release Description:** According to the incident report, the release was discovered at 6:45 am on August 7, 1972. There are two 60,560 liter (16,000 gallon), underground day tanks on the north side of the 384 Powerhouse. At the time of the release, one day tank was full and one day tank was empty. The operator was instructed to fill the empty tank, but failed to close the valve on the full tank.
and open the valve to the empty tank. Approximately 3,220 liters (850 gallons) of #6 fuel oil overflowed from the full day tank when the oil was transferred from the storage bunker. The spilled oil was retained in the concrete valve pits around the day tanks and in the soil between and around these two adjacent tanks. However, approximately 114 liters (30 gallons) of the total oil spilled flowed into the 384 Building drain trench through conduits constructed to carry oil pipes through the building foundation to the trench. This oil mixed with waste water and emptied into a sewer system that terminates in a sump located in the southeast corner of the basement of the 384 Building. A heavy scum of oil was observed on the surface of the sump. A sump pump normally lifted the water from the basement to the process sewer which flows to the north process pond (WIDS Site 316-2). Since the pump suction was at the bottom of the sump, an immediate check was made of the process pond. A significant scum of oil was visible in the fore bay of the first holding section of the pond. An estimated 38 liters (10 gallons) of oil was observed floating on the process pond.

Related Sites/ Structures:  
UPR-300-7 was associated with the day tanks (WIDS Site 300-223) behind the 384 Building, the North Process Pond (WIDS Site 316-2) and WIDS Site 300 ASH PITS.

Waste Type:  Process Effluent

Waste Description:  
The release consisted of approximately 3,220 liters (850 gallons) of #6 fuel oil. An estimated 3,028 liters (800 gallons) were recovered in cleanup operations. Approximately, 114 liters (30 gallons) were conveyed to the powerhouse, of which (20 gallons) went to the ash pits and 38 liters (10 gallons) were observed at the process pond (WIDS Site 316-2). That would leave approximately 38 liters (10 gallons) that may have remained in the soil between the day tanks, the powerhouse facility, piping, the ash pits or process ponds. All values are approximate (as stated in the incident report).

Closure Info:  Remediation activities were initiated in May 1998 and continued into January 1999. On January 25, 1999 a decision was made to suspend excavation activities at the North Process Pond and mobilize work crews to the South Process Pond pending resolution of contractual issues with the remedial action subcontractor. Work crews remobilized to the North Process Pond and completed excavation activities in June 1999.

Based on data collected during the remedial investigation, the pond was divided into the Above Cleanup Level (ACL), Below Cleanup Level (BCL), and Undetermined Contamination Level (UCL) areas prior to excavation. The UCL area included the Scraping Disposal Area (sitecode 618-12). Four UPRs associated with the north pond were also associated with the south pond. UPR-300-34, UPR-300-35, UPR-300-36 and UPR-300-37 were addressed with the South Pond remediation (316-1). UPR-300-7 was closed out with the North Pond (316-2).

<tr>
<td>Location:</td>
<td>UPR-300-13 occurred adjacent to the underground spent acid receiver tank (WIDS Site 300-21) that had been located east of the 333 Building. The underground tank has been removed. The 334-A Building is now located at this location.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Process Description:
At the time of this release (1973), waste etch acid from the 333-N Fuel Fabrication process drained to an underground tank filled with limestone. The limestone was used to neutralize the acid. The tank had been in service since the start up of the 333 Building.

Related Sites/Structures:
UPR-300-13 was associated with the underground spent acid receiver tank (WIDS Site 300-21), the 333 Building (WIDS Site 300-32), and the 618-1 Burial Ground.

Waste Type: Storage Tank
Waste Description: The waste contained process acid that included 4,432 pounds (2,012 kilograms) of nitrate, 447 pounds (202.9 kilograms) of copper, and 3 pounds (1.4 kilograms) of uranium.

Release Description:
The release occurred on July 31, 1973. A chemical operator noted that the liquid level in the 14,383 liter (3800 gallon) tank was below the normal pump suction level. It was known that the tank had been previously pumped down to the 4,542 liter (1200 gallon) heel on the morning of July 31, 1973. In the afternoon of the same day, 1805.45 liters (477 gallons) of liquid waste from the Zircaloy etching tank was added to the heel. In the afternoon of August 1, 1973, the process engineer investigated the tank plug and valve integrity. He found no problems, so he added water to the tank to recheck the possibility of a leak. In the morning of August 2, 1973 a water level check confirmed that 363.4 liters (96 gallons) of liquid had been lost. The test indicated a hole in the tank wall and that approximately 4,920.5 liters (1300 gallons) of liquid waste had been lost to the ground. Spent acid had leaked to the ground through a hole in a koroseal-lined mild steel receiving tank wall. The extent of contamination is not known. The acid receiving tank was isolated. Samples of the lost liquid (collected prior to the leak) were analyzed to characterize the contents of the spill. The sample results showed that 2015 kilograms (4432 pounds) of nitric acid, 44 kilograms (96 pounds) of fluoride, 217 kilograms (477 pounds) of copper and 1.4 kilograms (3 pounds) equivalent to 0.0005 curies of uranium were lost to the ground. 870 kilograms (1910 pounds) of caustic was added to the leaking tank and allowed to leak into the soil to neutralize the acid that had escaped into the ground. The leak rate of the tank was 582.9 liters (154 gallons) per hour.

Location:
UPR-300-14 occurred at the 334 tank farm and traveled through a trench to an open-bottomed limestone pit (See WIDS Site 300-246) located over the 618-1 Burial Ground.

Release Description:
On July 18,1975, a line break in the fill line to Tank No. 32 from the 23,000-liter (6,000 gallon) #3 high tank in the 334 tank farms caused the loss of 4,540 liters (1,200 gallons) of 93% sulfuric acid solution. The solution traveled through a concrete trench to a limestone pit that had been designed to neutralize spilled acid. The limestone pit drained to the soil in the 618-1 Burial Ground.
A trench sump was installed below the 334 Tank Farm to collect solutions from chemical spills, including the elevated acid storage tanks, the safety showers, and rainwater, etc. The trench sump drained to an open limestone pit located about 6.1 meters (20 feet) east of the 334 Tank Farm. The limestone pit had an open bottom and drained to the 618-1 Burial Ground soil beneath the pit. The limestone pit was isolated after this unplanned release. The 334 Tank Farm pipe trench and sump were sealed from the drain line to the limestone pit and connected to the process sewer.

Waste Type: Storage Tank
Waste Description: The release consisted of 93% sulfuric acid.

This Site Was Consolidated With:
Code: 618-1
Names: 618-1; Solid Waste Burial Ground No. 1; 300 Area Burial Ground No. 1; 318-1

On August 27, 1962, an employee was sprayed by a release from a low-level cesium-134 waste line. The release occurred on August 27, 1962. In the process of removing a drain plug from a low-level cesium-134 waste line, a pipefitter received general protective clothing contamination up to 10,000 counts per minute (shoes 1,000 counts per minute and coveralls 10,000 counts per minute) when solution unexpectedly squirted out of the drain. The main valve had been turned off and the solution in the line was purportedly at near static pressure at the time of the release. The pipefitter immediately replaced the plug and prevented further contamination spread. The employee reported that he felt liquid strike his face and mouth. A whole body radiation survey detected contamination to the employee's coveralls and shoes but no skin contamination. A subsequent whole body count proved negative. A follow up inspection by operations personnel revealed that the main valve had failed to seat properly. The fault was corrected and the lines flushed of all foreign solid material. The amount released to the ground was not mentioned in the report.

Related Sites/Structures: UPR-300-18 was associated with a drain plug from a low-level cesium-134 waste line.

<tr>
<td>Process Description:</td>
<td>During the time of the oil crisis (1980s), the coal liquefaction process was developed to produce an alternative fuel source. Full scale production pilot plants were developed to liquefy coal through fractional distillation. Each of the pilot plants developed their own process for liquefying coal. Solvents were used to liquefy the coal. Pacific Northwest Laboratory's (PNL's) task was to study the effects of fractional distillation on the genotoxic potential of solvent refined coal liquids. PNL received product material from six different source pilot plants. Samples that were taken from the source product were subjected to initial chemical analysis, chemical fractionation, and in vitro bioassay. The references listed describe the tests and the results.</td>

Spills in the 313 Uranium Recovery Area could have entered this line, resulting in ground disposal of hazardous</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The 313 Building process sewer collected chemical waste solutions from throughout the chemical processing areas from the start of operations in the 313 Building. The waste solutions drained to the 300 Area ponds until the 1970s when process effluent improvement projects were begun to replace liquid waste discharges to the soil with collection and treatment processes. (See WIDS Site 313 URO).

Waste Type: Storage Tank
Waste Description: The release consisted of wastewater and possibly uranium-bearing acid (nitric and sulfuric acid with uranium in solution) or waste-etch acid (nitric, hydrofluoric, and chromic acids with uranium, copper, and zirconium metals in solution) to the soil. The spill area was possibly contaminated with byproduct waste material.

Location: The site is located north of the 427 building and east of the FMEF cooling units.

Release Description: In February or March 1984, a solution consisting of approximately 189.3 liters (50 gallons) of 50% water and 50% ethylene glycol (aircraft de-icer mix) was spilled on the ground during construction.

Waste Type: Storage Tank
Waste Description: The waste consisted of approximately 189.3 liters (50 gallons) of a coolant solution consisting of 50% water and 50% ethylene glycol.

Code: UPR-300-38; 313 Slab; Demolished 313 Building Foundation; Soil Contamination Beneath the 313 Building
Material.  

Location: UPR-600-1 occurred in the 618-10 Burial Ground and spread to an area extending approximately 274 meters (300 yards) outside the burial ground fence in the 600 Area.

Release Description: The unplanned release at the 618-10 Burial Ground was caused by a fire within a burial trench.  The fire destroyed all flammable material in the affected trench.  The fire spread radioactive particulates to the immediate environment.  At a distance of 15 to 23 meters (50 to 75 feet) outside the burial ground fence, the particle concentration was approximately 20 particles per 9.3 square meters (100 square feet).  Most particles measured in excess of 100,000 counts/minute.  At a distance of 274 meters (300 yards) from the fence, the particle concentration was 3 particles per 9.3 square meters (100 square feet) ranging from 4,000 to 20,000 counts/minute.  After the fire was extinguished, the trench was covered with dirt.

Related Sites/Structures: UPR-600-1 was associated with the 618-10 Burial Ground.

Waste Type: Equipment

Waste Description: The waste consisted of burned "CWS" filters and an unknown amount of other materials.

Waste Type: Equipment

Waste Description: The waste consisted of approximately 200 boxes of contaminated materials.

Type: Unplanned Release

Start Date: 1/1/1963

End Date: 1/1/1963

Description: Contamination from this incident was identified in a 1.5 meter (5 foot) radius around the burial receptacle in the 618-10 Burial Ground, an area in front of the burial ground access gate, and a spot in front of the 300 Area Powerhouse.  The 618-10 Burial Ground has since been stabilized and revegetated.  The burial ground is posted with Underground Radioactive Material signs.

Location: Contamination from UPR-600-2 was limited to an estimated 1.5-meter (5 foot) radius around the burial barrel in the 618-10 Burial Ground, an area in front of the burial ground access gate, and a spot on the road in front of the 300 Area Powerhouse.

Release Description: During a routine "milk can" burial, a contamination spread occurred at the 618-10 Burial Ground.  An investigation resulted when the truck driver was found to be contaminated after completing the burial.  A radiation survey was conducted from the 327 Building to the 618-10 Burial Ground.  A spot of contamination was found in front of the 300 Area Powerhouse. Another area of contamination was found in front of the burial ground access gate. No contamination was found on the highway.  A 1.5 meter (5 foot) radius around the burial receptacle was found to be contaminated to 80,000 counts per minute.

Related Sites/Structures: UPR-600-2 was associated with the 618-10 Burial Ground and the 300 Area Powerhouse.

Hanford Site Waste Management Units Report
February 2015

2312
Waste Type: Process Effluent
Waste Description: Contamination detected at the time of the release ranged from 60,000 to 80,000 counts per minute around the barrel in the 618-10 Burial Ground, 40,000 counts per minute in front of the 300 Area Powerhouse, and 80,000 counts per minute in front of the burial ground access gate.

This Site Was Consolidated With:
Code: 618-10
Names: 618-10; 300 North Solid Waste Burial Ground; 318-10

Code: UPR-600-3
Names: UPR-600-3; Contamination Spread at 618-10
Type: Unplanned Release
Status: Inactive
Classification: Accepted
Reclassification: Consolidated (2/24/1999)
Start Date: 1/1/1963
End Date: 1/1/1963
Description: The release site was an area of soil around a burial barrel within the 618-10 Burial Ground. The release area was surface stabilized with the rest of the burial ground in 1983. The burial ground is fenced and posed as an Underground Radioactive Material area.

Location: The release site was approximately 56 square meters (600 square feet) of ground within the 618-10 Burial Ground in the 600 Area.

Release Description: On September 4, 1963, an improper container was used to dispose of waste into the 618-10 Burial Ground. The lid of the container came off, causing dust to puff out of the barrel and onto the ground. An area approximately 56 square meters (600 square feet) was contaminated to 400 millirads/hour at 5 centimeters (2 inches). The truck and the driver were also slightly contaminated.

Related Sites/Structures: UPR-600-3 was associated with the 618-10 Burial Ground.

Waste Type: Storage Tank
Waste Description: The waste consisted of radioactive dust that was improperly containerized.

This Site Was Consolidated With:
Code: 618-10
Names: 618-10; 300 North Solid Waste Burial Ground; 318-10

Code: UPR-600-4
Names: UPR-600-4; Contamination Spread at 618-11
Type: Unplanned Release
Status: Inactive
Classification: Accepted
Reclassification: Consolidated (2/24/1999)
Start Date: 1/1/1964
End Date: 1/1/1964
Description: The release consisted of an area of soil contamination in the 618-11 Burial Ground. The release site was surface stabilized along with the rest of the burial ground in 1983.

Location: UPR-600-4 contaminated an estimated 93 square meters (1,000 square feet) in the 618-11 Burial Ground in the 600 Area.

Release Description: A trailer truck hauling two waste casks from the 327 Building attempted to deposit waste into the vertical waste barrels at the 300 Wye Burial Ground. As a waste can was dropped into a burial barrel, a "blowback" of radioactive material occurred, contaminating of four employees,
the vehicle and approximately 90 square meters (1000 square feet) of ground in the burial ground. Soil contamination levels averaged 10,000 counts per minute. It was also discovered that three of the waste cans had fallen from the cask and were lodged in the drop chute of the second cask. It was determined that the slide on the bottom of the cask had not been properly secured and the waste had vibrated into the drop chute during transit.

Related Sites/Structures:
UPR-600-4 was associated with the 618-11 Burial Ground.

Waste Type: Storage Tank
Waste Description: The release consisted of radioactive waste from the High-Level Radiochemistry Facility. The waste had readings of up to 10,000 counts per minute.

This Site Was Consolidated With:
Code: 618-11
Names: 618-11; Y Burial Ground; 300 Wye Burial Ground; 318-11

Description: The release site was covered with a layer of clean material immediately after the release. The release site consisted of an area of soil in the 618-11 Burial Ground. The 618-11 Burial Ground was surface stabilized in 1983. The burial Ground is fenced and posted as Underground Radioactive Material.

Location: UPR-600-5 contaminated an estimated 167 square meters (1,800 square feet) of ground surface in the 618-11 Burial Ground.

Release Description: On May 18, 1964, a contamination incident occurred while dumping canned waste from the 325 Building from a waste cask at the 300 Wye Burial Ground. The waste truck was positioned over a waste receptacle barrel and the waste chute was opened. Fine white powder was seen drifting out of the chute. After washing down the chute and the plastic chute extension, contamination was detected. Ground contamination was identified measuring approximately 167 square meters (1800 square feet) with contamination levels of 500 counts per minute. An area of 18 square meters (200 square feet) was contaminated with levels ranging from 10,000 to 20,000 counts per minute. Two employees were also found to be contaminated. A layer of ballast (gravel) was placed over the ground contamination and reduced the readings to background levels.

Related Sites/Structures:
UPR-600-5 was associated with the 618-11 Burial Ground.

Waste Type: Storage Tank
Waste Description: The release consisted of gross fission products with beta and gamma contamination. The wastes were generated in the Radio Chemistry Building (325 Building) and packaged in cars.

### Description:
The release contaminated an area of soil in the northeast corner of the 618-11 Burial Ground. The 618-11 Burial Ground was surface stabilized in 1983. The burial ground is fenced and posted as Underground Radioactive Contamination.

### Location:
The release contaminated approximately 36 square meters (400 square feet) of soil around Barrel 327-2 in the 618-11 Burial Ground.

### Release Description:
On September 30, 1963, a contamination release occurred during a routine, high level waste burial at the 300 Wye (618-11) Burial Ground. A "Milk Pail" container that was externally contaminated with a significant amount of loose, highly radioactive material, was discharged into the 327-2 vertical waste barrel (caisson) causing a contamination spread. Although the wind was less than 16 kilometers per hour (10 miles per hour), an area of contamination was identified that measured approximately 36 square meters (400 square feet) around the barrel. The cask truck had smearable contamination measuring 180 millirads/hour inside the left rear wheel, 40 millirads/hour on the drop chute and 10 millirads/hour on the top of the cask. The truck was sprayed with a fixing agent and taken to 200 West Area for decontamination. The maximum contamination reading on the ground was 1.4 rads/hour.

### Related Sites/Structures:
UPR-600-10 was associated with the 618-11 Burial Ground.

### Waste Type:
Process Effluent

### Waste Description:
The release consisted of high-level beta and gamma contamination with readings of up to 1.4 mrad/s at 7.6 centimeters (3 inches).

### This Site Was Consolidated With:
- **Code:** 618-11
- **Names:** 618-11; Y Burial Ground; 300 Wye Burial Ground; 318-11

Status: Inactive  
End Date: 1/1/1986  

Description: The site of the release is a concrete boat ramp and the shoreline, periodically flooded as the Columbia River rises daily and seasonally.  

Location: The release occurred at the patrol boat refueling area just south of 100N Area on the Columbia River.  

Release Description: Gasoline was spilled inside a patrol boat during refueling operations, and gasoline was discharged from the boat to the shoreline. The release occurred on August 17, 1986.  

Waste Type: Process Effluent  
Waste Description: The release consisted of 268.4 liters (70.9 gallons) of gasoline.

Code: UPR-600-18  
Classification: Accepted  
Reclassification: Rejected (10/1/1997)  

Names: UPR-600-18; Tank Truck Gasoline Spill; UN-600-18  
Type: Unplanned Release  
Start Date: 1/1/1987  
End Date: 1/1/1987  

Description: The site is an area where petroleum products leaked to the soil from a fuel delivery truck accident. The release occurred April 16, 1987 9:00 AM and resulted in the spill of CERCLA reportable materials. Appropriate notifications were made to the Department of Energy, Environmental Protection Agency, State of Washington, and Rockwell (maintenance and operations contractor) management.  

Location: The site is located 0.8 kilometers (0.5 miles) south of 100 F Area on the 100 F access road.  

Release Description: The conditions were dry, clear weather and straight roadway. The pavement and road shoulders were in good repair with the ditch approximately 0.91 meters (3 feet) deep and the inslope and backslope, a three to one slope. The driver of a fuel delivery truck (#68C 4366) (Road, Delivery and Equipment Operation Department) had turned off of Route 2 North onto the 100-F Area access road. Approximately 1.61 kilometers (one mile) north of the turn off his gate keys fell to the floor. He leaned over to pick them up and the vehicle ran off of the paved roadway onto the right side road shoulder. The vehicle then went over the shoulder and part way down the inslope. He tried to steer back onto the roadway and lost control. The vehicle then turned over onto its right side blocking both lanes. The driver exited out of the left side of the vehicle and proceeded on foot to 100-F Area to call for assistance. Hanford Patrol and Fire Department arrived on the scene and isolated the immediate area. The diesel tanks on the vehicle seemed intact and fuel was leaking from one top fill cap. A wrecker, rigging crew and front-end loader were dispatched to assist in uprighting the vehicle. The vehicle and surrounding area were foamed by the Hanford Fire Department. Two Ironworker riggers in full fire fighting clothing attached nylon chokers to the fuel vehicle. The wrecker and front-end loader were positioned and attached to the nylon chokers. The fuel vehicle was uprighted without any further damage or spillage of fuel. The remaining fuel was then pumped into a spare fuel truck. The spill area was washed onto the road shoulder and ditch area by the Hanford Fire Department. The fuel truck was then taken to the 1100 Area and the road was then reopened for traffic.  

Waste Type: Process Effluent  
Waste Description: The release was a total of 1,354 liters (395 gallons) of fuel consisting of 26 liters (7 gallons) of #2 diesel oil, 434 liters (112 gallons) of unleaded gasoline, 38 liters (10 gallons) of ethylene glycol, and 856 liters (226 gallons) of leaded gasoline.
The site is an unplanned release. An old wooden barrel that pre-dated MED operations deteriorated and collapsed, spilling the contents (about 45 kilograms [100 pounds] of powdery lime sulfur) onto the ground. The site was abandoned when the DeWitt Buckholdt Ranch was taken over by the U.S. Army Corps of Engineers in 1943.

The site is located 402 meters (1320 feet) west of Route 2 North and approximately 183 meters (600 feet) south of mile marker 3 at the old Herriford (Buckholdt Ranch) home site. The lime sulfur was located about 0.91 meters (3 feet) off the access road, approximately in front of the house foundation and southeast of the well house foundation.

An old wooden barrel of lime-sulfur fungicide had broken, and its contents had spilled to the ground.

The waste is lime sulfur powder. According to regulatory support personnel, lime sulfur is not a listed waste. WAC 16-154-100 Materials List for Organic Food Production -- Disease Control Materials and Practices states the following: "Approved materials. The following list of disease control materials and practices are approved for use in organic crop production. Some approved materials have certain restrictions regarding their use. These restrictions are noted in the list. Lime sulfur: Foliar application as a fungicide only."

The Waste Encapsulation and Storage Facility is a TSD site within the 225-B Building, which is on the west side of 221-B Building (B Plant).

The building addition is located on the west end of the 221-B canyon building. It was built on top of the 216-B-60 crib.

Two areas within WESF are permitted in the Hanford Facility Dangerous Waste Part A Permit Application (Rev. 0, 12/19/97) to store capsules and/or unencapsulated salts. Pool cells number 1 through 8 and 12, located on the west side of the 225-B building, provide underwater storage for radiological protection from cesium-137 and strontium-90 capsules. Process cells A through G, in the south side of the 225-B Building, provide interim dry storage of capsules and/or unencapsulated salts. The maximum process design capacity for miscellaneous storage in pool cells 1 though 8 and 12 is approximately 4,484 liters (1,184.55 gallons) and for process cells A though G is approximately 56 liters (14.79 gallons).
**The TK-100 System**

The TK-100 System was used as a catch tank to transfer low-level radioactive liquid waste from WESF through B-Plant to the Double-Shell Tank System. Closure activities were completed in September 1998 and included sampling and analysis of the piping rinsate, removing the tank to a permitted TSD facility (B Plant Complex), removing any waste residues from the vault, and decontaminating and visually inspecting the vault. Piping (floor drains and sump) rinsate was sampled on July 14 and 15, 1998, and analyzed for 1,1,1-tri-chloroethane. All eight samples (K0N378 through K0N385) had less than detectable levels of 1,1,1-trichloroethane.

**The SubSite is Part Of:**

- **WRAP**
  - **Code:** WRAP
  - **Classification:** Accepted
  - **Reclassification:** None
  - **Start Date:**
  - **End Date:**
  - **Type:** Process Unit/Plant
  - **Status:** Active
  - **Description:** This site is operational. WRAP Module 1 is a large metal frame structure. The module has facilities necessary to handle, treat, and store a wide variety of wastes. Module 2A is planned to be a metal structure designed to receive and ship low-level waste to the enhanced Radioactive and Mixed Waste Storage Facility. Module 2B is still in development.
  - **Location:** The WRAP Facility will be located west of Dayton Avenue, north of Twenty-Second Street, and south of Twenty-Third Street.
  - **Related Sites/Structures:** Structures associated with this unit include the Radioactive Mixed Waste Storage Facility, the rest of the Central Waste Complex, and the process equipment that will be located in WRAP.
  - **Process Description:** The WRAP Facility is a treatment and storage unit for radioactive and/or mixed waste in containers on the Hanford Facility. The different modules of WRAP are used to receive, certify, repackage, characterize, treat, and store radioactive and/or mixed waste from the Hanford Site.
  - **Waste Type:** Process Effluent
  - **Waste Description:** The unit consists of a storage and treatment facility for transuranic, low-level, low-level/mixed, and nonradioactive dangerous waste.

- **Z PLANT BP**
  - **Code:** Z PLANT BP
  - **Classification:** Accepted
  - **Reclassification:** Consolidated (5/31/2001)
  - **Names:** Z PLANT BP; Z Plant Burn Pit; Z Plant Burning Pit
This unit is a rectangular burning pit trench located within (under) Burial Ground 218-W-4C. Stenner et al. report that the burning pit was exhumed during the excavation of Trench 7 in 218-W-4C. Because the site is entirely contained within the burial ground, and was exhumed during construction of the burial ground, it is proposed for consolidation with site 218-W-4C. Future remedial activities will address both sites together, and the sites are linked under the Regulatory tab page of WIDS.

The unit was located in the 218-W-4C Burial Ground at Trench 7.

Structures associated with this unit include Z Plant Laboratories, offices, and the 218-W-4C Burial Ground.

The Z Plant Burning Pit was a disposal site for combustible nonradioactive construction, office and non-hazardous laboratory waste, including unnamed chemicals. The burn pit is reported to have received 2,000 cubic meters (70,000 cubic feet) of wastes for burning, including 'less than' 1,000 cubic meters (35,000 cubic feet) of laboratory chemicals.

The site was used to burn combustible nonradioactive waste and non-hazardous laboratory waste, including unnamed chemicals.

This Site Was Consolidated With:
Code: 218-W-4C
Names: 218-W-4C; Dry Waste No. 004C
Reclassification: 100-B-34; B/C-Area Pipelines under Active Utilities/Structures

Type: Product Piping

Status: Inactive

Description: The site consists of multiple segments of underground, miscellaneous pipelines in the 100-B/C Area that required remediation but were deferred due to the presence of active utilities. Three pipeline segments were administratively removed from 100-B-28 [RSVP-2009-057] and 100-C-6:1. They are included in 100-B-34 so that 100-B-28 and 100-C-6:1 could be reclassified.

The following pipeline segments have been included in this waste site:

(1) A section of 7.62 centimeter (3 in) steel, soft water pipeline that was converted for use with sodium dichromate about 1962 (P-5528, P-5649). The pipeline ran between the 184-B Power House and the 183-C Head House. The majority of the pipeline was remediated as 100-B-28. This section could not be removed due to the presence of active export water line. Following discussion with the U.S. Department of Energy, Richland Operations Office (DOE-RL), and U.S. Environmental Protection Agency (EPA), the section was filled with grout to flush residual sodium dichromate liquid out for collection. However, the potential for pipe leakages beneath these sections cannot be addressed while the utilities remain active. Therefore, in agreement with DOE-RL and EPA, the section was administratively removed and reassigned to this site (150166). Another section of the same pipeline was assigned to 100-C-7:1 so that it would be closed during that remedial activity.

(2) Two sections of 1.7 meter (66 in) steel process sewer that carried effluent from the 105-C Reactor to the retention basin (P-5591, M-1904-B Sheets 4 and 9). The majority of the pipelines were remediated as 100-C-6:1. These sections could not be removed due to the presence of an overlying active export water line (CVP-2003-00022). This piece of pipe was previously known as 100-C-6:5, but is now considered part of 100-B-34.

Location: The pipeline segments are located throughout the 100-B/C Area.

---

Reclassification: 100-B-35; 151-B Primary Substation and 152-B1 Secondary Electrical Substation

Type: Electrical Substation

Status: Inactive

Description: The waste site is the electrical substations located in 100-B Area. The site was divided into two subsites. Subsite 1 is the Primary Electrical Substation and Subsite 2 is the Secondary Electrical Substation. Subsite 2 has been reclassified to Interim No Action.

Location: The 151-B Primary Substation was located approximately 350 meters (1150 ft) southwest of the 105-B Reactor Building. The secondary, 152-B1 Substation was located south of the 181-B Building, approximately 820 meters (2,690 ft) northwest of the 105-B Reactor Building.

Process Description: The 151-B Substation served as the primary source of electrical power for all facilities in the 100BC Area. It was first energized in June 1944, and received 230 kV power from the Midway Hanford Site Waste Management Units Report
February 2015
Substation. From the three main transformers in the 151-B Switch Yard, power was transmitted primarily via underground cables to thirteen secondary substations and nine distribution substations located throughout the 100BC Area. One 27.5 KVA transformer, located adjacent to the 151-B Switch House, provided service for the building. Five oil circuit breakers were also in service to support the switch yard operations. In 1952, the substation was expanded to support the new 105-C Reactor facilities, including the construction of an addition to the Switch House as well as additional equipment in the Switch Yard (HW-24800-101). Polychlorinated biphenyl (PCB)-containing oil was transferred, as needed, from a rail tanker on the railroad spur through above ground and underground piping to transformers and oil circuit breakers in the yard. The 152-B1 Substation provided power to the nearby 181-B Building. It had a primary voltage of 13.8 kV and a secondary voltage of 2.3 kV (HAN-10970 Vol. 3, p. 716). Originally there were four 1500 KVA 13800/2300V single phase transformers manufactured by the Kuhlman Electric Company. The substation was constructed in 1944. Two transformers were added in 1952 when the 151-B building was expanded (P-5032).

This Site has the Following SubSites:

- **Code:** 100-B-35:1
  - **Names:** 100-B-35:1; 151-B Primary Electrical Substation

- **Code:** 100-B-35:2
  - **Names:** 100-B-35:2; 152-B1; 152-EB1; 100-B Secondary Electrical Substation

- **Code:** 100-B-35:1
  - **Classification:** Accepted
  - **Names:** 100-B-35:1; 151-B Primary Electrical Substation
  - **Reclassification:** None
  - **Type:** Electrical Substation
  - **Start Date:** 6/1/1944
  - **End Date:** 1/1/1998
  - **Description:** The 151-B Primary Substation included a wooden fenced, gravel surfaced area as well as a reinforced concrete and concrete block switch house along the north side of the fence. The fenced area contained wooden frame bus structures, two main 15,000 KVA transformers, three oil circuit breakers, and terminal structures. The 151-B Switch House was a one story building, with a sub-level cable pit equipped with a sump pump. The main floor was comprised of a switch room, with a fan room, battery room, and restroom at one end. The cable pit was a completely enclosed reinforced concrete pit with floor slab that extended to a depth of 3.6 meters (12 ft) below grade. In 1952, both the Switch Yard and Switch House were expanded to support the new facilities associated with the 105-C Reactor. The Switch Yard expansions included the installation of a new 18,750 KVA transformer, oil circuit breakers, disconnect switches, bus, and conductor (HW-24800-101). Below-grade oil transfer lines were installed within the Switch Yard to fill the oil circuit breakers per drawing P-5615.

  - **Location:** The 151-B Primary Substation was located approximately 350 meters (1150 ft) southwest of the 105-B Reactor Building.

  - **Process Description:** The 151-B Substation served as the primary source of electrical power for all facilities in the 100BC Area. It was first energized in June 1944, and received 230 kV power from the Midway Substation.

The SubSite is Part Of:

- **Code:** 100-B-35
  - **Names:** 100-B-35; 151-B Primary Substation and 152-B1 Secondary Electrical Substation

  - **Code:** 100-B-35:2
    - **Classification:** Accepted
DOE/RL-88-30
Rev. 24

Names: 100-B-35:2; 152-B1; 152-EB1; 100-B Secondary Electrical Substation

Reclassification: Interim No Action (6/23/2014)

Type: Electrical Substation

Start Date: 

Status: Inactive

End Date: 

Description: The waste site has been evaluated and determined to require No Action. The secondary substation consisted of a small fenced area surrounding utility poles and concrete pads that once supported six transformers. In 1952, the 152-B1 Substation was expanded to include two additional 1500 KVA transformers in support of the addition to the 181-B Building and the new 105-C Reactor (P-5032). In 1960, cooling fans were installed on each of the transformers (H-1-12033). The aboveground structures were removed as a Miscellaneous Restoration activity.

Location: The 152-B1 Substation was located south of the 181-B Building, approximately 820 meters (2,690 ft) northwest of the 105-B Reactor Building.

Process Description: The 152-B1 Substation was constructed in 1944 and was known as 152-E1B. It provided power to the nearby 181-B Building. It had a primary voltage of 13.8 kV and a secondary voltage of 2.3 kV. Originally, there were four 1500 KVA 13800/2300V single phase transformers manufactured by the Kuhlman Electric Company. Two more were added in 1952.

Oil containing polychlorinated biphenyls (PCBs) was transferred, as needed, from oil trucks through over-ground hoses to smaller transformers at the secondary and distribution substations.

Closure Info: Confirmatory sampling was performed at the 100-B-35:2 subsite on February 20, 2014, per the Work Instruction for Confirmatory Sampling of the 100-B-35, 151-B Primary Substation and 152-B1 Secondary Substation (WCH 2013b). Confirmatory sampling of the 100-B-35:2 subsite was performed to support evaluation of the site against the RAGs specified in the Remaining Sites ROD (EPA 1999). The analytical results were evaluated against the cleanup criteria specified in the RDR/RAWP (DOE-RL 2009b) to support a No Action or Remedial Action decision.

The SubSite is Part Of:

Code: 100-B-35

Names: 100-B-35; 151-B Primary Substation and 152-B1 Secondary Electrical Substation

Hanford Site Waste Management Units Report
February 2015
Process Description: Water from the Columbia River was extensively treated before passing through the reactor. The water was then circulated in a single pass through the reactor process tubes, cooling tubes imbedded in the thermal shield, and reactor horizontal control rods. After exiting the reactor, the cooling water passed through a retention basin and was then discharged to the river. During reactor operations, fuel cladding failures sometimes occurred while the fuel element were in the process tubes. Over the operational lifetime of the reactor, there were several hundred such cladding failures. When fuel cladding failed, the cooling water in the affected process tubes became highly contaminated and elevated radiation levels were observed in the cooling water exiting the reactor core. This highly contaminated water was diverted to a trench for ground disposal rather than to the Columbia River. During reactor operations and reactor shutdowns, large quantities of decontamination solutions were used routinely to remove radionuclides from reactor equipment and facility surfaces. Decontamination activities took place at the dummy decontamination facility wash pad, which was adjacent to the fuel storage basin. Known decontamination solutions included chromic acid, citric acid, oxalic acid, nitric acid, sulfamic acid, sulfuric acid, and sodium fluoride. Other chemicals, including organic solvents were also used for some decontamination processes. The reactor had many safety and control mechanisms. The function of the horizontal control rods (HCRs) was to control the equilibrium and transient power levels of the reactor during routine operations and to maintain the desired neutron flux distribution. The HCRs were each about 11.0 meters (36 feet) long, with the poison (neutron absorbing) segment being about 8.96 meters (29.4 feet) long. Two of the rods were electrically driven and seven were hydraulically driven. The latter were known as shim rods and were used to achieve ongoing operation control and desired fluctuations. The vertical safety rods (VSRs) were 11.9 meter (39 foot) long, stainless steel sleeves with 0.74 millimeter (3/16 inch) thick boron stainless steel sleeves inside. Each VSR was inserted and withdrawn from the reactor via two separate cables wound around a winch located 12.2 meters (40 feet) above the top of the reactor. In cases of automatic shutdown ("scram") of the reactor, the electromagnetic clutch holding each rod would be deenergized (demagnetized), and the rods would free fall by gravity into channels penetrating the reactor. A "last ditch" safety system, a boric acid solution, was held in a large pedestal tank at the top of each reactor and connected to each of the 29 VSR channels via 1.27-centimeter (0.5-inch) pipes. The liquid boron system was later replaced by a method that used solid boron steel and carbon steel balls (Ball 3X System). The normal method for reactor refueling was displacement charge-discharge during reactor shutdown. During a refueling operation, the tubes to be discharged had their rear nozzle caps removed. New fuel elements were pushed into the process tube by a charging machine which caused the irradiated fuel elements in the tube to be displaced. The displaced irradiated fuel elements dropped into a water filled discharge chute and slid down into the metal pickup area at the end of the storage basin. The 6.1 meters (20 feet) of water in the chute area provided shielding as the elements accumulated and were sorted into buckets using long, hand-operated tongs. The buckets were then transferred by an overhead monorail system to the storage aisles where they were held for a time to allow the decay of short-lived radionuclides. Following the storage period, the buckets of fuel elements were moved by the overhead monorail system to the transfer area. At the transfer area, the irradiated fuel was loaded into casks, then raised by a crane and placed in special railroad cars for shipment to the chemical reprocessing facilities in the 200 Area.

Waste Type: Process Effluent

Waste Description: This Reactor building contained an estimated 23,500 curies of radionuclides, 79,800 kilograms (88 tons) of lead, and 227 kilograms (500 pounds) of cadmium.

Waste Type: Process Effluent
**Waste Description:**

The Reactor Building is estimated to contain 85.0 cubic meters (3000 cubic feet) of asbestos.

**Description:**

Subsite 1 is the reactor building that includes the graphite core, control room and fuel storage basin. The 105-B Reactor was transferred from Washington Closure Hanford (WCH) to Fluor Hanford (FH) on 3/16/2009. WCH is still responsible for managing nuclear materials within the transfer pit and reactor core.

**Location:**

The 105-B Reactor is near the center of the 100-B/C Area, and about 0.9 kilometers (0.6 miles) south of the Columbia River.

**Process Description:**

The reactor rests on a 7.0-meter (23-foot) thick concrete foundation topped with cast iron blocks that served as a thermal shield. The building walls consists of reinforced concrete in the lower portions and concrete blocks in the upper portions with thickness varying from 0.9 to 1.5 meters (3 to 5 feet). The roof is composed of precast concrete roof tiles, except for the discharge area enclosure and inner horizontal rod room where the roof was composed of 1.8-meter (6-foot) thick reinforced concrete.

The reactor core consisted of a graphite "stack" that measured 8.5 meters (28 feet) from front to rear, 11.0 meters (36 feet) from side to side, and 11.0 meters (36 feet) from top to bottom. The stack was pierced front to rear by 2,004 process channels that held the fuel elements. Nine horizontal channels for control rods entered from the left side and 29 vertical channels for safety rods entered from the top. Six test holes labeled A through F, leading from the right, existed for irradiation of experiments, foils, counters, ionization chambers, and special samples. The horizontal control rod (HCR) and vertical safety rod (VSR) channels, as well as the test holes, were lined with a thin sheet of aluminum known as a “thimble”.

The graphite core is surrounded by a cast iron thermal shield layer. Cooling for the top, side, and bottom shields were provided by circulating water tubes imbedded in the blocks. The entire reactor block was then enclosed in a welded steel box that functioned to confine the inert gas atmosphere within the reactor. Expansion joints were placed on the corners of the block to allow for thermal expansion and expansion bellows were located at each process tube opening. The bellows served as gas seals as the process tubes expanded and contracted with temperature and with the distortions of the graphite.

The fuel storage basin is located at the rear of the reactor. The concrete basin area served as a collection, storage, and transfer facility for the irradiated fuel elements discharged from the reactor. The water in the basins served both as coolant and as shielding. The basin consisted of a discharge chute and fuel element pickup area, a storage area, a transfer area, and a wash pad.
Waste Type: Sanitary Sewage

Waste Description: This Reactor building contains an estimated 23,500 curies of radionuclides, 79,800 kilograms (88 tons) of lead, and 227 kilograms (500 pounds) of cadmium. The Reactor Building is estimated to contain 85.0 cubic meters (3000 cubic feet) of asbestos.

Description: The subsite consists of fourteen French drains around the periphery of the 105-B Reactor Building. During two walk downs in September 2004, the 14 suspect French drain locations were recorded using global positioning system (GPS) instrumentation and were photographed. Several drains included piping that was painted pink.

Because of variables, each of the suspect drain sites will require further investigation prior to cleanup activities, including removal of covers and visual inspection and sampling of drain fill material and surrounding native soil.

During WCH walkdowns on 9/7/2004 and 9/13/2004 around the periphery of the 105-B Building, fourteen suspect French drain locations were recorded using global positioning system (GPS) instrumentation and were photographed. Most of the suspect drains had protective covers. No inspection was attempted beneath those covers. Some of the covers had been penetrated by over-ground piping and others had holes that suggested previous discharge points. Other French drains may have received discharges from underground piping.

Location: French Drain #1 is a concrete box with a wooden cover, less than 1 square meter (10.8 square feet) in cross-section. It is located adjacent to the northeast corner of the 105-B Building, under a sign painted on the concrete block wall labeled Drain 1 and has a pink-colored steam condensate line coming out of the wall. It disappears into the soil directly adjacent to the box. It is located at E 565331, N 144524.

French Drain #4 is a concrete box with a wooden cover, less than 1 square meter (10.8 square feet) in cross-section. It is located adjacent to the southeast corner of the 105-B Building, under a sign painted on the concrete block wall labeled Drain 4. The cover is penetrated by a 10 centimeter (4 inch) pipeline that emanates from a larger line. It is located at E565331/N144502.

French Drain #11 is a confined space about 5 meters (16 feet) from a northeast corner of the 105 B Building, with a red, metal manhole cover. No over-ground lines connect to it. It is located at E565320/N144531.

French Drain #12 is a confined space near a northeast corner of the 105-B Building, with a metal manhole cover penetrated by a 1.3 centimeter (0.5 inch) and a 2.5 centimeter (1 inch) pink-colored pipeline. It is located at E565310/N144533.

French Drain #13 appears to be a clay or concrete pipe adjacent to a northeast corner of the 105 B Building, less than 1 meter (3 feet) in diameter, with only soil visible on its surface. It is
penetrated by 10.2 centimeter (4 inch) pipeline. It is located at E565310/N144535.

French Drain #14 is a 1.4 meter (4.6 foot) diameter concrete pipe, 2.5 meters (8 feet) from the northeast corner of the 105-B Building. It appears to have a cover with a lifting ring. No over-ground pipelines connect to it. It is located at E565299/ N144562.

French Drain #15 is a 20 centimeter (8 inch) clay pipe on the northwest corner of the 105-B Building. It is filled with soil with no cover or over-ground lines connecting to it. It is located at E565263/N144545.

French Drain #16 is a 1 meter (3 foot) diameter concrete pipe near the northwest corner of the 105-B Building, with soil visible on its inside. A one 2.5 centimeter (1 inch) pipe is penetrating the top of the drain and a second, capped line terminates just above its surface. It is located at E565262/N144541.

French Drain #18 is a 1 meter (3 foot) diameter confined space along the west wall of the 105-B Building with a metal cover. The cover has a 7.6 centimeter (3 inch) hole in it and a similar-sized pipe terminates near the surface of the cover. It is located at E565252/ N144499.

French Drain #19 is a 1.4 meter (4.6 foot) diameter confined space along the west wall of the 105-B Building. It has a solid, concrete cover with no over-ground lines connecting to it. It is located at E565252/N144491.

French Drain #20 is a 1 meter (3 foot) diameter concrete pipe near the southwest corner of the 105-B Building, and has a metal cover. A 2.5 centimeter (1 inch) pipe penetrates the cover. A similar-sized pipeline (painted pink) terminates just above a second hole in the cover. It is located at E565255/N144473.

French Drain #21 is a 1 meter (3 foot) diameter concrete pipe along the south wall of the 105-B Building just outside a door marked Inner Instrument Room. It has a metal cover and is penetrated by a pink-colored 1.3 centimeter (0.5 inch) pipeline. It is located at E565284/N144495.

French Drain #22 is a 1 meter (3 foot) diameter confined space along the south wall of the 105-B Building, and has a metal cover. A pink-colored 2.5 centimeter (1 inch) pipeline penetrates the cover and two other lines enter the soil near the confined space. It is located at E565299/N144492.

French Drain #23 is a white-painted, insulated pipe that directly enters the soil along the south wall of the 105-B Building. It is located at E565308/ N144492.

**Process Description:**

French drains were designed to receive nonradioactive liquids from the 105-B Reactor Building, via over-ground and/or underground piping. The discharges included steam condensate and floor drain wastes. The liquids would percolate through the gravel/soil fill, and out the open end at the bottom of the drain into the native soil. No information could be found to corroborate what liquid waste streams from the building were discharged to each of these suspect drains. Because B Reactor was a first-of-a-kind operation and a national priority, it is prudent to assume that any of these suspect drains could have received unplanned and/or unrecorded releases of both radioactive and nonradioactive CERCLA wastes. It should be noted that the soil associated with some of the French drains at both D Reactor and F Reactor have tested positive for heavy metals and fission products. (See sites 100-F-10, 116-D-6 and 116-F-11.)

**Waste Type:** Sanitary Sewage
**Waste Description:**
The waste are the french drains, piping to the french drains, and potentially contaminated soil associated with the french drains.

**The SubSite is Part Of:**

- **Code:** 118-B-8
- **Names:** 118-B-8; B Reactor; 105-B Reactor Building

**Code:** 118-B-8:3

**Classification:** Accepted

**Reclassification:** None

**Names:** 118-B-8:3; 105-B Miscellaneous Pipeline Segments

**Type:** Reactor

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** The subsite consists of pipeline segments (DS-100BC-013, 014, 017, and 018, 024, 025, 026, 027, 028, 035, 041 and 043), that were deferred from the 100-B-21 pipeline waste site. The segments were within the 7.6 meter (25 foot) reactor facility buffer zone, and were identified during removal of effluent pipelines and site characterization in the 100-B/C Area. The pipelines were cut approximately 15.2 meters (50 feet) from the reactor footprint so as not to disturb the 105-B Reactor structure. The numbering system for the segments was created and assigned by the subcontractor (WCH) as they were recorded in the field.

There were two pipelines associated with the 120-B-1 Battery Acid Sump inlet and outlet pipelines that were also left in place. They were cut off and grouted at the edge of the 120-B-1 remediation footprint. These have been assigned to the 118-B-8:3 subsite (per RSVP-2006-057). Other pipelines in this subsite include the southern most part of the 1607-B2 septic system collection lines. They were not remediated with the 1607-B2 site because of their proximity to the reactor facility. They will be addressed with disposition of the 105-B facility (per RSVP-2006-055).

**Location:**
The coordinates were recorded using a Trimble survey grade Global Positioning Satellite (GPS) instrument, (centimeter accuracy), location coordinates were described in terms of Washington State Plane easting (E), northing (N), and elevation in NAVD88 (meters). For selected sites, Ground-Penetrating Radar (GPR) was also utilized. Dimensions were noted during site characterization. Contaminants of Potential Concern were listed only for segments known to have contaminants. The sample data results have not been loaded into HEIS.

DS-100BC-013 pipeline segment is a 20 centimeters (8 inches) diameter steel line, length unknown. The coordinates at the cut end were E 565322.97, N 144540.94, and elevation 141.71 meters. It was discovered during the excavation of the 16.5 meter (54 inch) cross-tie effluent pipeline. The pipeline segment was shallow and did not appear on project drawings. It has been cut off, the end pinched closed, and the site backfilled. No sampling was conducted.

DS-100BC-014 pipeline segment is a 20 centimeter (8 inch) diameter (estimated), steel line, length unknown. The coordinates at the cut end were E 565337.60, N 144532.97, and elevation 142.22. This pipeline was located approximately 14.5 meters (47.6 feet) east of the DS-100BC-013 segment. It was discovered during the excavation of the effluent pipelines northeast of 105-B. The pipeline was shallow and not apparent on project drawings. It has been cut off, the end pinched closed, and the site backfilled.

DS-100BC-017 pipeline segment is a 20 centimeter (8 inch) diameter (estimated), steel pipeline that entered a junction box, length unknown. The coordinates at the cut end were E 565313.35, N 144550.66, and elevation 141.01 meters. It was pinched closed and backfilled in place. The pipeline was not apparent on project drawings. No sampling was conducted.
DS-100BC-018 pipeline segment is a 30.5 centimeter (12 inch) diameter (estimated) steel pipeline, length unknown. It ran at a diagonal to the former junction box. The coordinates at the exposed ends were (E 565311.85, N 144550.88) and elevation 142.84 meters and E 565317.95, N 144542.72, and elevation 142.98 meters. The pipeline, which was left intact, could not be found on project drawings. No sampling was conducted.

DS-100BC-024 pipeline segment is a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the cut end were E 565320.28, N 144549.81, and elevation 141.25 meters. It has been cut off, covered with plastic and plywood, and backfilled. No sampling was conducted.

DS-100BC-025 pipeline segment is a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the cut end were E 565320.71, N 144545.69, and elevation 138.25. It has been cut off, covered with plastic and plywood, and backfilled. No sampling was conducted.

DS-100BC-026 pipeline segment is a large-diameter pipeline (actual diameter and length were unknown). The coordinates at the capped end of the pipeline were E 565331.46, N 144547.78, and elevation 138.05 meters. The pipeline entered the excavation from the south sidewall and angled northeast toward a large diversion box. The pipeline was found capped with a steel plate. It was not identified on project drawings. No sampling was conducted.

DS-100BC-027 pipeline segment is a concrete pipeline (actual diameter and length were unknown). The coordinates at the end of the segment were E 565341.83, N 144535.68, and elevation 139.28 meters. On 6/16/2003 field screening for radiological control was performed. No analytical samples were collected.

DS-100BC-028 pipeline segment is a vitreous clay pipeline (actual diameter and length were unknown), embedded in concrete in tandem with DS-100BC-027, entering the pipeline excavation south of a junction box. The pipeline coordinates at the end were E 565340.04, N 144536.38, and elevation 139.19 meters. Sections of this pipeline to the south have not been removed. This pipeline was not identified on project drawings. Fine-grained sediment was observed along the bottom of the pipeline. It was unclear if the material was from processes associated with the pipeline or washed in from dust-suppression efforts during remediation. On 6/16/2003 field screening for radiological control was performed, however, no analytical samples were collected.

DS-100BC-035 pipeline segment is a 137.2 centimeters (54 inches) large-diameter concrete pipeline (length unknown) encased in concrete. The coordinates were E 565306.48, N 144581.69, and elevation 139.80 meters. The structure was capped with plastic and plywood and had a tar/asbestos gasket at the cold joint of the concrete encasement. Contaminants of concern was asbestos. On 3/5/2003, sample J00J04 was collected from the gasket material and sent for asbestos analysis.

DS-100BC-041 pipeline segment is of undetermined diameter [at least 30.5 centimeters (12 inches), actual diameter and length were unknown], just below grade. The coordinates were E 565327.99, N 144535.81, and elevation 142.68 meters. No sampling was conducted. This pipeline was believed to travel in a southwest direction toward a metal plate covered structure on the northeast of the 105-B Reactor Building. The pipeline was not found on project drawings.

DS-100BC-43 consists of a group of pipelines around the south and southwest sides of the 105-B Reactor. The following alpha characters have been added as an indicator for a specific pipeline. The pipeline coordinates were estimated from the center (not accounting for bends) of lines. The diameters of these pipelines were unknown; the lengths were: A - E 565341, N
144510, 58.7 meters (192.6 feet) long; B - E 565335, N 144523, 12.6 meters (41.3 feet) long; C - E 565336, N 144508, 12.7 meters (41.7 feet) long; D - E 565335, N 144504, 10.6 meters (34.8 feet); E - E 565335 N 144492, 12.7 meters (41.6 feet) long; F - E 565335, N 144486, 11.5 meters (37.8 feet); G - E 565313; N 144480, 73 meters (239.5 feet) long. No sampling was conducted.

**Waste Type:** Sanitary Sewage

**Waste Description:** The waste is mixed (chemically and radiologically) contaminated piping (concrete, steel and vitrified clay) and piping contents (scale and sediment), and contaminated soil.

<td>Description:</td>
<td>The waste site is the 105-C reactor facility. It was divided into three subsites: Subsite 1- the inactive plutonium production 105-C Reactor Core and ISS Project, Subsite 2- the 105-C Reactor Building Below-Grade Structures and Underlying Soils and Subsite 3 - the 105-C French Drains. The 118-C-3 site is an inactive reactor building has been reduced in size and placed in Interim Safe Storage (ISS). The original facility consisted of the reactor block, which included the graphite core, thermal shields, pressure tubes, and the safety and control systems. The irradiated fuel storage basin was constructed below grade.</td>
</tr>
<tr>
<td>Location:</td>
<td>The site is located in the 100 B/C Area, south of the 105-B reactor.</td>
</tr>
</tbody>
</table>

**Release Description:** There may have been some seepage from the fuel storage basins, in which case the soil column under the basins may be contaminated. The soil has not been characterized, but the radionuclide inventory is estimated to be low when compared to the total inventory in the reactor.

**Process Description:** The facility was a water cooled, graphite moderated nuclear reactor that irradiated uranium fuel rods. The plutonium by-product was extracted from the irradiated rods in the 200 Area Fuel Separations plants. Before the reactor was placed into interim safe storage, the original facility consisted of the reactor block, which included the graphite core, biological and thermal shields, pressure tubes, and the safety and control systems. The irradiated fuel storage basin was constructed below grade. The reactor building was constructed with 0.9 to 1.5-meter (3 to 5-foot) thick concrete walls around the reactor core and corrugated asbestos/cement siding upper walls. The original roof construction was reinforced concrete over the inner rod room and the rear face enclosure and poured insulating concrete over the rest of the building.

**Waste Type:** Oil

**Waste Description:** In 1987, the facility was estimated to contain approximately 25,000 curies of radionuclides, 95,000 kilograms (105 tons) of lead, and 200 cubic meters (7000 cubic feet) of asbestos. During the Interim Safe Storage project, approximately 198 cubic meters (6600 cubic feet) of asbestos was removed along with 500 tons of interior and exterior transite panels. During 1996 through 1998, the total estimated inventory of lead was increased to 203 tons. Seventy tons of lead was removed. Material that was radioactively contaminated was take to the Environmental Release.

**Description:**
The subsite is the cocooned reactor core. During 1996 through 1998, the reactor building was placed in Interim Safe Storage (ISS) status. The safe storage condition is designed to safely contain the reactor for up to 75 years. The process included removing all portions of the reactor facility outside of the reactor core shield walls and capping the roof with Galvalum steel. Electric and water utilities were isolated.

The safe storage enclosure (SSE) consists of the area within the shield walls, including the reactor block, the front-face of the reactor area, the elevator and the rear-face work area. This part of the reactor building will remain in place to act as temporary storage for the reactor block. As much as was practical, objects and surface contamination were removed. A new roof was added as part of the Interim Safe Storage (ISS) effort. All doors were permanently sealed, except for one door that remains locked and is welded shut. The only planned entrance to this structure is for surveillance and maintenance activities that occur approximately every 5 years.

Location: The site is located in the 100 B/C Area, south of the 105-B reactor.

Process Description: The facility was a water cooled, graphite moderated nuclear reactor that irradiated uranium fuel rods. Water from the Columbia River was extensively treated before passing through the reactor. Water then circulated in a single pass through the reactor process tubes, cooling tubes imbedded in the thermal shield, and reactor horizontal control rods. After exiting the reactor, contaminated cooling water passed through a retention basin and was then discharged to the river.

Type: Reactor
Status: Inactive
Classification: Accepted
Start Date:
End Date:
Description: The waste site has been remediated and reclassified to Closed Out in August 2000. The remedial action involved the decommissioning and decontamination of associated structures and soils at the 105-C Reactor to the extent required leaving only the reactor core to be placed in Interim Safe Storage status. Remediation included the removal of hazardous and radiologically contaminated material from the fuel storage basin, below grade rooms, tunnels and contaminated soils that were adjacent to the reactor core. Contaminated material was disposed of in the Environmental Restoration Disposal Facility (ERDF). The excavated areas were backfilled to grade with clean material.

Location: The site was located in the 100 B/C Area, south of the 105-B reactor.

Closure Info: The remedial action involved the decommissioning and decontamination of associated structures and soils at the 105-C Reactor to the extent required leaving only the reactor core to be placed in Interim Safe Storage status. Remediation included the removal of hazardous and radiologically contaminated material from below grade rooms, tunnels and contaminated soils. Contaminated material was disposed of in the Environmental Restoration Disposal Facility (ERDF). The excavated areas were backfilled to grade with clean material.

General remedial actions in the 105-C Reactor Building included surveys and removal of hazardous chemicals, asbestos, equipment, and radiologically contaminated materials, allowing unrestricted release of the below-grade structures. During Initial characterization, concrete cores were removed from the fuel storage basin floor for radiological and chemical analysis. Core samples were collected from the fuel storage basin structure. It was determined that the upper 4.6 meters (15 feet) of the structure needed to be removed. The lower portion of the walls and the floor were left intact. The lift station walls were demolished and removed. Four areas within the below-grade rooms and tunnels were found to exceed the cleanup levels (as measured by the radiological survey), including portions of tunnel section 5, tunnel sections 7 and 9, a portion of the tunnel section 13 wall, and the battery room floor. Decontamination and removal/disposal activities were selectively performed.

A geoprobe sampling device was used to sample the soil at a variety of depths (up to 3.2 meters [10.5 ft]) beneath the concrete. Additional concrete was removed (the upper 4.6 meters [15 ft]) and the lower portion left in place to meet the shallow and deep zone cleanup criteria, respectively. Verification sampling and radiologically surveying of the concrete (to a depth of 0.6 cm [0.25 in]) was conducted for the other below-grade structures and additional concrete and floor drains were removed to meet the cleanup criteria.

</table>
The electrical equipment room drain (southwest) was located at N143991/E565333. The decontamination room drain (southeast) was located at N143979/E565390.

Closure Info: The area around all four drains was disturbed and/or excavated during 105-C Reactor decommissioning activities. The area around the french drain to the southeast of the reactor was extensively excavated during the remediation of the 100-B/C south effluent pipelines. The entire area was backfilled and smoothed to grade after the various excavations. Prior to confirmatory sampling no visual surface indicators of the french drains remained, but no record of their removal or remediation could be found. To ensure complete cleanup of the Hanford Site a document search was conducted and found evidence of a potential liquid waste site. The french drains were likely condensate drains from the sealed steam heating system that would not have been subject to contamination from within the reactor building. However, the exact history of the drains is unknown, hence the need for the confirmatory sampling.

Excavations at the four french drain locations found three of the four drains partially intact. The fourth drain, #4 to the southeast, was not found in the excavation. It is assumed to have been previously removed. The three french drains found were excavated and sampled just below the bottom of the drain. The southeast location was excavated to 4.6 meters (15 ft) below ground surface and sampled at the bottom of the excavation. This sample design follows an agreement with the U.S. Environmental Protection Agency for sampling an analogous french drain at the 105-F Reactor, which was also removed during decontamination and decommissioning activities.

Per the 105-C Reactor Interim Safe Storage Project Final Report, the walls of the structures within the area described were removed to 4.6 meters (15 feet) below grade. The Cleanup Verification Package for the 105-C Reactor Building Below-Grade Structures and Underlying Soils released the soils under the reactor. The french drains were not included in cleanup activities associated with the Cleanup Verification Package for the 100-B-8:1 and 100-C-6:1 100-B/C South Effluent Pipelines.

Type: Laboratory
Status: Inactive
Description: The site has been remediated and Interim Closed Out. The site consisted of a single-story, 33.4 square meter (360 square feet), pre-fabricated metal structure on a concrete slab. It was remediated with a large grouping of other waste sites.

Related Sites/Structures: 122-DR-1 the 105-DR Large Sodium Fire Facility and the 116-DR Reactor Exhaust Stack (132-DR-2/122-DR-1:5).

Closure Info: Note - The 105-DR reactor operated between 1950 and 1964 for plutonium production. In 1973, the exhaust system portions of the 105-DR reactor were reactivated and re-purposed to support the Large Sodium Fire Facility (LSFF). The LSFF (sitecode 122-DR-1) was a RCRA TSD. Most of the components of the reactor exhaust system have two entries in the WIDS.
database, one representing the CERCLA (radioactive) contaminants and the other representing the RCRA hazardous chemical contaminants.

The portions of the LSFF TSD that are included in this remedial activity are the 117-DR Exhaust Filter Building (100-D-53/122-DR-1:4), the underground exhaust tunnel (122-DR-1:2), the 119-DR Exhaust sample building (100-D-64), two dry wells (100-D-23 and 100-D-54) and the 116-DR Exhaust Stack (132-DR-2/122-DR-1:5) Four of the seven 122-DR-1 subsites (122-DR-1:1, 122-DR-1:3, 122-DR-1:6 and 122-DR-1:7) were closed out under the 105-DR Large Sodium Fire Facility RCRA Closure Plan (LSFF Closure Plan) are were not discussed in the CVP-2003-00018 Cleanup Verification Package.

The remedial objective for the structures was to remove each structure to a minimum of 0.9 meters (3 feet) below surface grade. In July 2003, remedial/removal action activities removed the 117-DR Exhaust Filter Building (100-D-53/122-DR-1:4), the downstream (post-filter) tunnel and the additional 0.9 meters (3 ft) of the 116-DR Reactor Exhaust Stack (132-DR-2/122-DR-1:5). The aboveground portion of the 132-DR stack had been demolished in 1999.

Large Sodium Fire Facility (LSFF) subsite 122-D-1:2 (underground tunnel between the 105-DR Building) and the 117-DR Exhaust Filter Building were entirely removed. The 315 and 316 exhaust plenums, (aka upper and lower exhaust tunnels) are also associated with the 122-D-1:2 subsite. The upper exhaust tunnel and approximately the top 0.9 meters (3 ft) of the lower exhaust tunnel were removed. The 119-DR Exhaust Stack Sampling Building and two stack sampling building dry wells (100-D-23 and 100-D-64) were also demolished and excavated as part of the remedial/removal action activities in July 2003.

At the completion of the remedial action, the total excavation was approximately 1,010 square meters (10,872 square feet) in area with an approximate depth of 5 meters (16.4 feet). Approximately 14,011 metric tons (15,412 tons) of material from the site were disposed of at the Environmental Restoration Disposal Facility.

</table>
| Description:  | The site has been evaluated and determined to require No Action. It consists of seventeen, unrelated pipeline segments. Fourteen were discovered during 100-D/DR remediation activities and determined to be not associated with an existing waste site. Three segments were determined to be segments of pipelines dispositioned with known waste sites. Some pipeline segments were assigned to this grouping following a spatial analysis of the pipeline geographic information system (GIS) assignments with those contained in regulator approved work instructions and closure documents. Some of the pipeline segments were either not assigned to a waste site or incorrectly assigned to a waste site when compared to the documents.

The following pipeline segments have been included in this waste site:

Segment 1 is a metal pipe that was discovered while excavating the 100-D-31:3 pipelines. The Segment 1 pipeline was located between the 108-D and 1703-D Buildings and extended north to south for a distance of at least 28 meters (92 ft) in two segments. The northern segment was observed in the 100-D-31:3 pipelines excavation and the southern segment of the pipeline was identified using geophysics. The diameter of the pipe was not documented.
Segment 2 is a 20 cm (8-in.) diameter, north to south oriented metal pipe discovered while excavating the 100-D-31:3 pipelines. The Segment 2 pipeline was located between the 1727-D Building and the 187-D1 Emergency Water Tank. The total length of the pipeline was determined to be approximately 95 meters (312 ft). The northernmost 20 meters (66 ft) of pipe was removed during remediation of 100-D-31:3.

Segment 3 is a metal pipe that was discovered while excavating the 100-D-31:3 pipelines. The Segment 3 pipe was located 8 meters (26 ft) south of the 1731-D Building and extended east to west a distance of at least 11 meters (36 ft). The diameter of the pipe was not documented.

Segment 4 is a metal pipe that was discovered while excavating the 100-D-31:3 pipelines. The Segment 4 pipe extended from the north end of the 1731-D Building south for 32 meters (105 ft) before turning west. Segment 4 then extended another 53 meters (174 ft) before turning south again and continuing under the 1726-D Building. The diameter of the pipe was not documented.

Segment 5 is a north-to-south oriented metal pipe that was discovered while excavating the 100-D-31:3 pipelines. The segment 5 pipe also fell within the boundary of the 100-D-56:1 pipeline excavation. The 100-D-56:1 excavation was approximately 1 meter (3 ft) deep in the area of the segment 5 pipeline. Segment 5 was located just east of the 1726-D Building and was adjacent to the segment 4 pipeline at this location. The diameter of the pipe was not documented.

Segment 6 is a 15 cm (6-in.) diameter metal pipe discovered while excavating the 100-D-31:3 pipelines. The Segment 6 pipe was located just west of the 1701-DA Building and extended 14 m (46 ft) to the west, into the 100-D-31:3 excavation.

Segment 7 is an 8 cm (3-in.) diameter pipe discovered while excavating the 100-D-31:1 pipelines. The Segment 7 pipe was located in the 100-D-31:1 excavation approximately 141 meters (463 ft) north of D Avenue. The pipe was oriented east to west and was identified as miscellaneous pipeline (MP) "MP-1" in the Remaining Sites Verification Package for 100-D-31:1, the 1607-D2 Septic Sewer Pipeline, and 100-D-31:2, the 1700-D Series Buildings Septic Sewer Pipelines.

Segment 8 is a 20 cm (8-in.) diameter pipe discovered while excavating the 100-D-31:2 pipelines. The Segment 8 pipe was located in the 100-D-31:2 excavation, approximately 19 meters (62 ft) east of the 1713-D Building. The Segment 8 pipe was oriented north to south and was identified as "MP-3" in the RSVP for 100-D-31:1 and 100-D-31:2.

Segment 9 is a 15 cm (6 in.) diameter cast iron pipe discovered while excavating the 100-D-31:2 pipelines. The Segment 9 pipe was located in the 100-D-31:2 excavation approximately 6 meters (20 ft) west of the 1713-D Building. The Segment 9 pipe was oriented north to south and was identified as "MP-5" in the RSVP for 100-D-31:1 and 100-D-31:2.

Segment 10 is a 10 cm (4 in.) diameter pipe discovered while excavating the 100-D-31:2 pipelines. The Segment 10 pipe was located in the 100-D-31:2 excavation approximately 10 meters (33 ft) west of the southeast corner of the 1717-D Building. The Segment 10 pipe was oriented north to south and was identified as "MP-8" in the RSVP for 100-D-31:1 and 100-D-31:2.

Segment 11 is a 25 cm (10 in.) diameter steel pipe discovered while excavating the 100-D-31:6 pipelines. The Segment 11 pipe was located in the 100-D-31:6 excavation approximately 72 meters (236 ft) east of the 1901-D Soft Water Tank. The Segment 11 pipeline location is also entirely within the former 100-D-31:7 pipelines excavation boundary in the upper west sidewall area of the excavation. The Segment 11 pipeline was oriented north to south and was identified as "MP-6" in the Remaining Sites Verification Package for the 100-D-31:6, 184-D Powerhouse.
Sewer Pipelines.

Segment 12 is a 10 cm (4 in.) diameter cast iron pipe discovered while excavating the 100-D-8 Process Sewer Outfall. The Segment 12 pipe was oriented east to west and was estimated to be at least 74 meters (243 ft) long based on ground-penetrating radar geophysics data. The pipe is located approximately 100 meters (328 ft) south of the 1907-DR Outfall Structure.

Segment 13 is a previously unassigned french drain and the associated 3.8 cm (1.5 in.) diameter drain line observed on drawing H-1-9006-DR. These features are associated with the desert cooler and drinking fountain at the 1702-DR Badge House.

Segment 14 is a steel pipe that was discovered while excavating the 100-D-32 waste site. The Segment 14 pipe was uncovered along the southwest corner of the 100-D-32 excavation sidewall at approximately 0.6 meter (2 ft) below grade. Segment 14 is located in the vicinity of a temporary sanitary water line that is part of the 100-D-63 Service Water Pipelines waste site. A linear feature that was observed on the geophysical investigation for 100-D-32 corresponds to the location of Segment 14 and indicated the pipe continued to the west.

Segment 15 is a 30 cm (12 in.) diameter east to west oriented pipe discovered while excavating the 100-D-1 waste site. Due to its location, the Segment 15 pipeline was initially thought to be associated with the 1904-D Spillway (sitecode 100-D-65), but there was not enough information to support that premise.

Segment 16 is a 1.9 cm (0.75 in.) diameter sodium silicate pipeline extending from the sodium silicate storage tank located in the pipe tunnels between 105-D and 190-D to the 30 cm (12 in.) diameter filtered water line to the 187-D1 Emergency Water Tank and the 30-cm (12 in.) diameter filtered water line to the 187-D2 Emergency Water Tank. Both 30 cm (12 in.) filtered water pipes that received the sodium silicate solution are part of the 100-D-63 waste site. Segment 16 pipelines carried sodium silicate only.

Segment 17 is a 1.9 cm (0.75 in.) diameter sodium silicate pipeline extending from the sodium silicate storage tank located in the pipe tunnels between 105-DR and 190-DR to the two 30 cm (12 in.) diameter filtered water lines that lead to either the 187-DR1 or 187-DR Emergency Water Tanks. Both 30 cm (12 in.) filtered water pipes that received the sodium silicate solution are part of the 100-D-63 waste site. Segment 17 pipelines carried sodium silicate only.

**Location:** The pipeline segments are located throughout the 100-D/DR Area.

**Process Description:** There is no process history associated with the 100-D-105 waste site.

**Closure Info:** The 100-D-105 waste site consists of 17 unrelated pipeline segments in the 100-D/DR Area. Fourteen segments were discovered during remediation of unrelated waste sites. These 14 pipelines were determined not to be associated with any existing waste site based on spatial analysis of the GIS assignments of these pipelines with those contained in regulator-approved work instructions and closure documents. The pipeline segments were either not assigned to a waste site or were found to be incorrectly assigned to a waste site when compared to the regulator-approved documents.

Pipeline Segments 1 through 12, 14, and 15 were discovered during remediation of unassociated waste sites. The process history of these pipelines is not known. Confirmatory sampling was done at the locations of these segments. The remaining Segments (13, 16, and 17) were previously unassigned pipelines with known process history. Segment 13 is a pipe and french drain associated with a drinking fountain. Segments 16 and 17 transported sodium silicate, which is not a regulated chemical. No confirmatory sampling was required for these.
three segments. Confirmatory samples were collected from test pits at the pipe segment locations. The depths ranged from 0.9 meters to 4.6 meters.

**Code:** 100-D-106  
**Classification:** Accepted  
**Names:** 100-D-106; 1607-D1 Influent Pipelines  
**Reclassification:** None  
**Type:** Sanitary Sewer  
**Start Date:**  
**Status:** Inactive  
**End Date:**  
**Description:** The site consists of the sanitary sewer pipelines that connected the service buildings at the 100-D main gate to the 1607-D1 septic tank. It also includes a french drain approximately 21 meters (70 ft) north of the 1709-D building (H-1-701).  
**Location:** The 100-D main gate (1701-D) was located approximately 1 Kilometer (0.6 miles) southeast of the 105-D Reactor Building.  
**Related Sites/Structures:** 1701-D Gate House, 1709-D Fire Headquarters and 1720-D Patrol Headquarters.  
**Process Description:** The site provided sanitary service for patrol and fire personnel located at the entrance to the 100-D/DR Reactor Area.

**Code:** 100-D-107  
**Classification:** Accepted  
**Names:** 100-D-107; Soil beneath the 1713-DA Essential Materials Warehouse  
**Reclassification:** Interim No Action (4/16/2014)  
**Type:** Unplanned Release  
**Start Date:**  
**Status:** Inactive  
**End Date:**  
**Description:** The site was evaluated and determined to require No Action. It consisted of the soil beneath and surrounding the demolished 1713-DA Essential Materials Warehouse. It is assumed the building was demolished during the mid-1950's. The 1713-DA Essential Materials Warehouse is analogous in operation to 1713-BA. The sodium dichromate contamination at 1713-BA (100-B-27) was directly related to operations in the 1713-BA Building. It is unknown whether or not there are any releases at 1713-DA from the operations involving sodium dichromate.  
**Location:** The 1713-DA building had been located near the intersection of Pump House Loop and Puyallup Street. The site was located 30 meters (98 ft) north of the 126-D-2 Coal Pit.  
**Related Sites/Structures:** The waste site is associated with 100-B-27.  
**Process Description:** The 1713-DA Building was used as the main receiving and storage warehouse in support of the initial construction of the 100D Area. After the end of the construction period, the building was kept in use as the Essential Materials Warehouse. During the 1940s and/or 1950s, the building may have been used to store solid sodium dichromate, which was classified as an essential material. Additional items that may have been stored within the building include other dry chemicals used in the 100D Area (e.g. lime, oxalic acid, etc.), spare parts and equipment. Sodium dichromate was used as an additive to the process cooling water for the 105-D and 105-DR Reactors as a corrosion inhibitor.  
**Closure Info:** Confirmatory sampling was performed on July 17, 18, and 23, 2013 from Test Trenches.
Confirmatory sampling results, in conjunction with field instrumentation screening results, indicate that the residual concentrations of COPCs at this site meet the RAGs for direct exposure, groundwater protection, and river protection. In accordance with this evaluation, the confirmatory sampling investigation results support a reclassification of the 100-D-107 waste site to Interim No Action.

---

**Code:** 118-D-6  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 118-D-6; 105-D Reactor Building  
**Type:** Reactor  
**Start Date:** 1/1/1944  
**End Date:** 1/1/1967  
**Description:** 118-D-6 is the 105-D Reactor Building and related support structures. It was divided into four subsites. Subsite 1 is the cocooned reactor core, that has been placed in Interim Safe Storage (ISS). It includes the graphite moderator (blocks) stack, biological and thermal shields, pressure tubes, and the safety and control systems. Subsite 2 is the Ancillary Support Areas, Below-Grade Structures and Underlying Soils the irradiated fuel storage basin. Subsite 3 is the Fuel Storage Basin and Underlying Soils. Subsite 4 is the 105-D Fuel Storage Basin Side Slope Soils.  
**Location:** The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 feet) north of the 105-DR Reactor.  
**Release Description:** It is suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation.  
**Process Description:** Between 1942 and 1955, eight water-cooled, graphite-moderated production reactors were constructed along the Columbia River in the 100 Areas of the Hanford Site. The construction of the first three Hanford reactor facilities (B, D, and F Reactors) utilized the same design drawings. The 105-D Reactor facility is located in the 100-D Area of the Hanford Site. Construction of the D Reactor was initiated in November 1943. Initial startup of the reactor was achieved on December 17, 1944. The D Reactor was shut down on June 26, 1967. Since deactivation, the 105-D Reactor has been in a condition of minimum surveillance and maintenance (S&M). Significant deterioration had occurred, particularly in the roof sections over the fan room and work area. Permanent decommissioning alternatives for the Hanford Site production reactors were assessed in the Final Environmental Impact Statement, Decommissioning of the Eight Surplus Production Reactors at the Hanford Site (DOE 1992). A Record of Decision (ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The ROD alternative selected was to place the reactors into a safe storage condition for up to 75 years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a specially prepared burial facility in the 200 West Area of the Hanford Site. The original footprint area of the 105-D Reactor Building was approximately 4,994 meters squared (53,750 square feet). The final ground-level footprint area of the safe storage enclosure (SSE) is 999 meters squared (10,750 square feet). The areas of the reactor building that have been removed to ERDF represent 80% of the original footprint of the reactor building outside of the reactor block shield walls.  
**Waste Type:** Water  
**Waste Description:** This unit contained an estimated 21,500 curies of radionuclides, 85,000 kilograms (94 tons) of lead, and 2.8 cubic meters (100 cubic feet) of asbestos. The primary source of contamination at the 105-D site was reactor coolant water and water in the FSB (118-D-6:3) that became contaminated through contact with irradiated and ruptured fuel elements and components from the reactor cooling system. The water was believed to have contaminated the concrete surfaces of the FSB. No documentation of basin water leakage into the underlying soils was discovered during the cleanup activities.

several Demolition Zones and the 132-D stack foundation. The Demolition Zones in subsite 118-D-6:2 are:

Demolition zone 1, located on the north side of the original reactor building, consisted of the water tower pedestal, the 103-D Unirradiated Fuel Element Storage Building, miscellaneous storage room 210, and room 215 on the ground level.

Demolition zone 2 was located on the west side of the original reactor building. At ground level this zone consisted of the 230a valve pit, the 310 supply fan room, the 231d tool room, the 231b laundry storage room, the 230b elevator and the 228a, 228b, 228c, 228d, 229a, and 229b offices.

Demolition zone 3 was located on the south side of the original reactor building. At ground level this zone consisted of the 311, 312, 313, and 314 fan rooms, 315 exhaust plenum, 114a clean storage room, 114b contaminated storage room, 213 stairway/corridor, 233a sample room and miscellaneous rooms 234 and 235.

Demolition zone 5 was located on the north side of the original reactor building. At ground level this zone consisted of the 211, 212, 218, and 219 miscellaneous rooms, the 220 control room, the inner horizontal control rod room, the outer horizontal control rod room and miscellaneous rooms numbered 222, 223, 224, 225, and 227.

Note: Demolition Zone 4, the fuel storage basin, became Subsite 118-D-6:3 and the fuels storage basin side slopes became Subsite 118-D-6:4.

Location: The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 feet) north of the 105-DR Reactor.

Closure Info: In 1984 when the reactor shut down, the Fuel Storage Basin (FSB) water level was lowered and the basin was cleaned out. Ruptured fuel elements had caused the shielding water to become highly contaminated. The remaining water was processed and released to 116-D-10 pond. Then an asphalt emulsion was applied to the floors and walls of the basin to fix the loose contamination to the basin structure. The hardware remaining in the basin (perfs, buckets, and sludge) were packaged and disposed of as low-level radioactive waste in the 200 Area burial grounds. The 132-D-4 stack was demolished and remediated to a depth of 0.9 meters (3 ft) below grade in 1999.

Removal and disposal activities at the 105-D site began in January 2000. For remediation purposes, the reactor area was divided into several Demolition Zones, the reactor core and the remaining portion of 132-D stack foundation. These areas were surveyed, and contamination was removed in preparation for clean demolition. With the exception of the Fuel Storage Basin walls and floor below 4.6 meters (15 feet), all structures in this zone were removed due to surface contamination being present. Sampling of underlying soils was not required because structures in this zone were not subjected to standing contaminated water and there was no mechanism for residual surface contamination to penetrate into the concrete and the underlying soil. The above and below grade structures were demolished. The demolition debris sent to ERDF. A section of 100 D-48:4 effluent pipeline remains buried under what was room 210. This section of pipeline will be considered separately from Demolition Zone 1 and deferred to the Remedial Action Project.

All known flammable and hazardous material was removed inside and outside of the Safe Storage Enclosure (SSE), with the exception of non-removable lead, generally in the form of lead-based paint inside the SSE. Concentrations of lead in the lead-based paint were determined to be below regulatory limits. After the hazardous materials were removed, the above and below grade structures at the 105-D site were ready for demolition. The above-grade structures were demolished, the overburden around the foundations was excavated, and the below-grade structures were demolished. During the demolition process, the resulting debris was loaded out
and shipped to ERDF for disposal. The 105-D site D&D activities included complete removal of above-grade structures outside of the 105-D Reactor core shield walls. A majority of the below-grade structures outside of the 105-D Reactor core shield walls were completely demolished. A portion of the south wall of the valve pit area (demolished to 0.9 meters [3 ft] below grade) and the entire Fuel Storage Basin floor and a portion of the walls (demolished to 4.6 meters [15 ft] below grade) were left in place based on deep zone cleanup criteria. The overburden piles produced during excavation were found to be contaminated. The overburden was deemed unsuitable for use as backfill of the site and was disposed in ERDF. The site was backfilled with clean soil/aggregate, using material from Borrow Pit 21 and graded to match the surrounding terrain. The 105-D D&D activities generated approximately 1,585 bulk containers of low-level contaminated material that were shipped to ERDF, accounting for approximately 21,613 metric tons (23,824 tons).

It was determined in the Sampling and Analysis Plan for Interim Closure of the 105-D and 105-H Reactor Below-Grade Structures and Underlying Soils that the 105-D FSB would not be cored to sample the underlying soils because this Fuel Storage Basin was not known to have leaked (the water level variations were consistent with evaporation). Coring would have been very difficult and potentially unsafe. The soils beneath the 100-C and 105-DR FSBs were found to be clean. The 100-D Reactor Site Technical Baseline Report suggests that all of the FSBs had leaked. However, this statement is not supported by the process history of the 105-D FSB. Sampling of the underlying soils at the 105-C and 105-DR FSBs showed that they had not leaked. The FSB concrete floors from all of the previously decommissioned reactors were found to have various types of contamination that penetrated only a maximum of a few millimeters into the concrete. Sampling showed the contamination had not penetrated through the 0.3 to 0.6 meters (1 to 2 feet) of concrete in the FSB floors.

The north decontamination pad, a section of 100-D-48:4 effluent pipeline, and the FSB side-slope soils remained to be addressed, having been deferred to the Remedial Action Project.

<td>118-D-6:4</td>
<td>Accepted</td>
<td>This subsite has been remediated and Interim Closed Out. The subsite consisted of the side slope soils associated with the Fuel Storage Basin, a former decontamination pad and one segment of an effluent pipeline. The Fuel Storage Basin (FSB) side slopes were located just outside of the remaining structure of the 105-D FSB, on the east side of the original reactor building. The side slopes could not be completely remediaded during the demolition of the Fuel Storage Basin (118-D-6:3). Subsequent characterization identified a contamination plume in the adjacent soil. The decontamination areas consisted of two pads that were located on the north and south sides of the reactor for the purpose of equipment decontamination during D&amp;D. The two areas were considered together during variance and verification sampling. During field screening and sampling, the area of the north decontamination pad was found to be larger than addressed for the sample design. On the north side of the decontamination pad area, a segment of the 100-D-48:4 effluent pipeline (beneath room 210) could not be removed during the reactor D&amp;D activities. The contamination from the pipeline was not fully remediaded during that remedial action because of interferences with reactor removal activities and the potential to cause structural problems for the foundation of the reactor. Both the remaining effluent pipeline segment and the remaining area for the north decontamination pad were included in the 118-D-6:4 subsite and deferred to the Remedial Action Project for remediation and cleanup verification.</td>

</tbody>
</table>

**Type:** Reactor

**Status:** Inactive

**Start Date:**

**End Date:**

**Location:** The 105-D Reactor site is located in the 100-D Area approximately 250 meters (820 ft) north of the 105-DR Reactor. The fuel storage basin was on the east side of the reactor.

**Closure Info:** The Fuel Storage Basin (FSB) side slopes could not be completely remediaded during demolition of the 118-D-6:3 FSB. The FSB remediation was halted in 2003 and clean fill was used to stabilize the excavation in support of the 105-D Reactor safe storage enclosure roof installation. It was documented that residual radiological contamination remained below the clean fill. The side slopes were placed in a separate subsite (118-D-6:4) for future remedial action. Part of the northern decontamination pad and the area adjacent to a remaining section of effluent pipeline beneath 105-D Reactor Room 210, that could not be removed during remediation of the 100-D-48 pipelines, were also included in remediation of the 118-D-6:4 subsite. Remediation of the 118-D-6:4 subsite was performed from May 5, 2008 through August 24, 2009. The comparison of the 2008-2009 excavation footprint and the 2003 remediation was performed to confirm that the current activities were comprehensive in removing the volume of clean fill and accessing the remaining contaminated material. All material excavated from the 2008-2009 118-D-6:4 subsite remediation was removed and disposed at ERDF. There was no overburden material associated with the waste site. Borehole sampling was performed within the 118-D-6:4 excavation to support the remedial investigation. Borehole #C7857 was drilled in January 2011 to a depth of approximately 27 meters (90 ft) below ground surface.

Two areas containing suspect anomalous materials were found during remediation: the first anomaly was less than 0.76 cubic meters (1 cubic yard) of red-stained soil in the FSB side slope soils approximately 3 meters (12 feet) below grade. The material appeared to be soil stained from either FSB sediments or an effluent pipeline leak from a north-south pipeline in the area.

Hanford Site Waste Management Units Report
February 2015
Effluent pipeline leaks at other 100 Area sites have often exhibited rusty, salmon colored staining on adjacent soils. The anomalous red-stained soil material was disposed at ERDF. The second anomaly was dust suppression and rain water retained within the soil in the residual FSB concrete structure. The material was excavated and disposed at ERDF.

Reclassification: 118-DR-2; 105-DR Reactor Building

Type: Reactor

Status: Inactive

Start Date: 1/1/1950
End Date: 1/1/1964

Description: The waste site is the 105-DR Reactor facility. It was divided into two subsites. Subsite 1 is the cocooned reactor core. It includes the graphite (block) moderator stack, the biological and thermal shields, the pressure tubes, and the safety and control systems. Subsite 2 is 105-DR Reactor ancillary support areas below-grade structures and underlying soil.

Location: The site was located at the south end of the 100 D/DR Exclusion Fence.

Release Description: It was suspected that the irradiated fuel storage basin leaked for a number of years prior to deactivation. The leakage rate was minimal, and the location of the leaks were never identified, with the exception of one leak outside of Door 14, that was identified and repaired in 1957.

Process Description: Construction of the 105-DR Reactor began in December 1947 and startup was achieved on October 3, 1950. The facility was a water cooled, graphite moderated nuclear reactor that irradiated uranium fuel rods. The design of the facility was based on the earlier Hanford Site reactors (118-D-6 and 118-F-8). Construction drawings of the older facilities were modified to form the design drawings for the 105-DR Reactor. The 105-DR Reactor was shut down on December 30, 1964. Deactivation of the reactor was completed in early 1971. Between 1972 and 1986, the southwest portion of the 105-DR Reactor building was used as a research laboratory known as the 105-DR Large Sodium Fire Facility (LSFF).

Since deactivation, the 105-DR Reactor has been in a condition of minimum surveillance and maintenance. Significant deterioration had occurred, particularly in the roof sections over the fan room and work area. Permanent decommissioning alternatives for the Hanford Site production reactors were assessed in the Final Environmental Impact Statement, Decommissioning of the Eight Surplus Production Reactors at the Hanford Site (DOE 1992). A Record of Decision (ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The ROD alternative selected was to place the reactors into a safe storage condition for up to 75 years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a specially prepared burial facility in the 200 West Area of the Hanford Site.

Waste Type: Process Effluent

Waste Description: This unit contained radiation levels estimated at 13,500 curies, 85,300 kilograms (94 tons) of lead, 2.8 cubic meters (100 cubic feet) of asbestos, and 230 kilograms (500 pounds) of cadmium.

<td><strong>Description:</strong> Subsite 2 is 105-DR Reactor below-grade structures and underlying soil. The subsite has been remediated and Interim Closed Out. For remediation purposes, the waste site was divided into five Zones and three decontamination areas. Zone 1 consisted of the Fuel Storage Basin (FSB), storage and transfer area, storage area, the transfer bay and the soils underlying the FSB. This zone was located entirely within the deep zone. Zone 2 consisted of the valve pit that received wastewater from the reactor building and the soil beneath it. Zone 2 was entirely within the deep zone. Zone 3 consisted of the solids feed area, the north water tunnel, and the trench under the accumulator room. The below-grade rooms, tunnel, and trench had been wetted by isolated spills and standing rainwater that may have acted as a hydraulic driver for potential...</td>
<td></td>
</tr>
</tbody>
</table>
contamination. Zone 3 was within the shallow zone.

Zone 4 consisted of the gas tunnel, exhaust plenum, gas recirculation tunnel, and the instrument room. These rooms and tunnels had been wetted by isolated spills and standing rainwater, which may have acted as a hydraulic driver for potential contamination. Zone 4 was entirely within the deep zone.

Zone 5 consisted of the side slope soils around the FSB, the south effluent pipeline, and the soil under the slab. Zone 5 also included a section of a process effluent pipeline located adjacent to the south side of the FSB. This area was included in Zone 5 because of its proximity to the side slopes of the FSB. Zone 5 was within the shallow zone.

The three decontamination areas were located around the reactor for the purpose of equipment decontamination. The northwest decontamination area was approximately 8.0 meters by 8.8 meters (26 feet by 29 feet). The northeast decontamination area was approximately 12 meters by 9.8 meters (39 feet by 32 feet), and the south decontamination area was approximately 16 meters by 17 meters (52 feet by 56 feet).

**Location:** The 105-DR Reactor is located south of the 105-D Reactor. The decontamination areas were on the northwest, northeast and south sides of the 105-DR structure.

**Related Sites/Structures:** This waste site is associated with 100-D-49:4 (North Effluent Pipe Tunnel).

**Closure Info:** The Cleanup verification package CVP-2003-00016 documents completion of removal action for 118-DR-2:2 Below Grade Structures and Underlying soils and the 100-D-49:4 pipeline in support of the 105-DR Reactor Interim Safe Storage Project. The 100-D-49:4 region consisted of the north effluent pipe tunnel, which had been removed. The soil beneath the floor and the side slopes were sampled for cleanup verification purposes. A portion of the 100-D-49:3 pipelines, located adjacent to the 105-D building, were also part of this remedial activity. The remedial activity was divided into five Zones, the north effluent pipeline and three decontamination areas. The three decontamination areas were also part of this remediation.

Removal and disposal activities at the 105-DR site began in September 1998 and concluded through September 2001. Excavation of the site involved removing the overburden materials, building structure, debris, and underlying contaminated soil. The 105-DR D&D activities resulted in removal of above-grade structures and below-grade structures outside of the 105-DR Reactor core shield walls, to 1 meter (3 ft) below surrounding grade, with the exception of the Fuel Storage Basin (FSB). The FSB structure was removed to 4.6 meters (15 ft) below the surrounding grade.

Sample results from the northwest and south decontamination areas resulted in additional excavation of these areas.

An individual calculation of contaminated material removed for cleanup of the pipeline area was not provided in the CVP. A total of approximately 7,220 cubic meters (25,500 cubic feet) of contaminated materials were disposed at the ERDF. The results of this effort indicated that the materials from the site containing COCs at concentrations exceeding RAGs have been excavated and disposed at the ERDF.

**The SubSite is Part Of:**

**Code:** 118-DR-2

**Names:** 118-DR-2; 105-DR; 105-DR Reactor Building

**Code:** 100-F-52

**Classification:** Accepted
Names: 100-F-52; 146-FR Radioecology/Aquatic Biology Laboratory Soil

Reclassification: Interim No Action (6/27/2008)

Type: Unplanned Release

Status: Inactive

Start Date: 

End Date: 

Description: The waste site has been evaluated and determined to require No Action. It consisted of the soil under and around the former 146-FR Radioecology and Aquatic Biology Laboratory. In November 1964 a fire destroyed the roof over the operating ponds. In June 1975 the concrete foundation was removed. After remediation, the site was level to grade with no visual indication of the former facility.

Location: The 146-FR Radioecology and Aquatic Biology Laboratory was located approximately 457 meters (1500 feet) northeast of the 105-F Reactor Building and about 122 meters (400 feet) southwest of the 1904-F Outfall.

Related Sites/Structures: The facility was associated with the 181-F River Pump House, the 190-F Main Process Pump House and Annex, the 107-F Retention Basin, and the 1904-F Outfall.

Process Description: Process liquids were supplied to the 146-F Fish Laboratory from several sources. Raw water was pumped from the 181-F River Pump House; chemically treated, pre-reactor process water was pumped from the 190-F Main Process Pump House and Annex; and reactor effluent process water was pumped from the 107-F Retention Basin. Aquatic river creatures were exposed to varying amounts of process effluents from 100 F Area operations, and the facility process wastes exited the south end of the building and passed through the 1904-F Outfall to the Columbia River.

Waste Type: Process Effluent

Waste Description: During research of the site history, no reports were found of unplanned discharges to the soil from this building. However, because of the open-pond operations within the building, it is prudent to assume such discharges may have occurred. Confirmatory sampling should be considered. Contaminants of concern/potential concern are based on those for the 1904-F Outfall (116-F-8). Contaminants of concern include cobalt 60, europium 152, europium 154, europium 155, and hexavalent chromium. Contaminants of potential concern include carbon 14, cesium 137, nickel 63, and strontium 90.

Closure Info: Previous remediation activities for several other waste sites had partially overlapped the 100-F-52 waste site location. A small area along the northern edge of the 146-FR Laboratory footprint was removed along with pipelines associated with the 100-F-33 and 100-F-19 waste sites. Soils that were adjacent to the eastern edge of the 146-FR Laboratory footprint were excavated when pipelines associated with the 1607-F6 waste site were removed. When pipelines associated with the 100-F-19 waste site were removed, the entire southern edge of the 146-FR Laboratory footprint was removed. Excavation associated with the 100-F-26:12 Main Process Sewer Pipeline removed soils underlying the entire southern edge of the 146-FR Laboratory footprint. No indication of the former facility or concrete footprint was found during a March 2007 site visit. The site was partially covered with excavation stockpiles derived from the 100-F-26:12 Main Process Sewer Pipeline excavation. That excavation had removed all of the shallow zone soils from the southern 5 meters (16 feet) of the 146-FR Laboratory footprint.

Geophysical surveys over several sections of the 146-FR Radioecology and Aquatic Biology Laboratory footprint were performed as part of the investigations of adjacent waste sites. In order to get a complete survey for the site, several surveys were merged to get an overall geophysical interpretation map of the 100-F-52 waste site. The resulting survey revealed an area of scattered debris and three pipeline segments. Two of the pipeline segments were just outside of the 146-FR Laboratory footprint and were rejected because they were used for treated water. A third section of pipe, within the footprint of the 146-FR Laboratory, was
approximately 22 meters (72 feet) long and 2 meters (3.3 feet) below ground surface. The pipe was included as part of the 100-F-52 waste site. A circular subsurface feature, approximately 12 meters (39 feet) north of the 146-FR Laboratory, can be seen in the geophysical survey interpretation. The location of the circular subsurface feature clearly identified it as the remnants of the circular pond that was closed as part of the 100-F-33 waste site.

Confirmatory sampling was performed on November 28, 2007 and February 20, 2008. A 5 centimeter (2-inch) diameter carbon steel pipe was discovered in each of two trenches, both trenches were sampled and backfilled. On February 20, 2008, the trenches were re-excavated, the pipes breached, revealing scale or sediment in one pipe which was sampled.

</table>
evaluation that supported a revised trench location, approximately 9 meters (30 ft) south of the original coordinates. Excavation was done at test trench #2 in January 2008. Samples of tar-like material, suspect asbestos found in pipe cradles at test trench #1, scabbled concrete and soil below test trench #2 were collected and analyzed. Based on the confirmatory sampling results, it was determined that remedial action was necessary at this waste site. The excavation exposed concrete slab walls approximately 1 meter (3 ft) apart, with debris filling the area between the walls. The debris was removed to reveal a trench, approximately 1.2 meters (4 ft) below ground surface (bgs), with pipe cradles along the length of the trench. The floor of the pump room was cleared of debris, exposing the pump pads and a grate covering the trench along the north wall. The pump room was examined for the potential location of a sump. It was concluded that no sump was present. Sample material was scabbled from each of the four pieces of concrete brought out of the trench. Soil samples were also collected from below the trench.

The excavation of the 100-F-57 waste site pipe cradles began on October 15, 2010, to collect waste characterization samples. Remediation of the 100-F-57 waste site began on December 6, 2010. On December 9, 2010, during exploration for the 100-F-57 northern pipe cradles, discolored (green-stained) concrete was discovered. The discolored concrete was surveyed using x-ray fluorescence (XRF) and high concentrations of chromium (>900 mg/kg) were detected. The discovery of the high hexavalent chromium concentrations in the in-process soil samples resulted in a design change from the original plan, which had only required remediation of the pipe cradles at the 100-F-57 waste site. October 2011, the project split the site into the 100-F-57:1 and 100-F-57:2 subsites to allow continued remediation of the western portion of the site and to facilitate closure of the eastern portion of the site and the overburden stockpile. The green stain became WIDS site 100-F-65, Green Stained Area Along Railroad Tracks Immediately West of 190-F. It was located approximately 20 meters (66 ft) west of the northwest side of the 190-F Building foundation.

Remediation of 100-F-65 was performed on July 25, 2011. The site was excavated to a depth of 1 meter (3.3 ft) bgs and resulted in approximately 84 BCM (109.9 BCY) of soil being removed and disposed at ERDF.

During the excavation, an underground injection control well was discovered on May 25, 2011 within the 100-F-57:2 subsite (at N147737.93, E580363.59). The underground injection control well was removed and disposed at ERDF. No other anomalies were noted during remediation.

The 100-F-57:2 waste subsite was excavated to groundwater levels in two locations.

Remediation of the 100-F-57:2 waste site was completed on April 9, 2012. The excavation reached a maximum depth of 12.8 meters (42 ft) bgs and resulted in approximately 55,701 BCM (72,854 BCY) of material being removed and disposed at ERDF. The debris included concrete, rebar, steel pipe, transite pipe, miscellaneous steel, wire, steel cable, and non-friable asbestos, unlike the friable asbestos discovered during confirmatory sampling.

| Code:   | 118-F-8         | Classification: | Accepted |
| Names:  | 118-F-8; 105-F Reactor Building | Reclassification: | None |
| Type:   | Reactor          | Start Date:     | 1/1/1944 |

| Description: | 118-F-8 is the 105-F Reactor Building, the ancillary support components and the underlying contaminated soils. The waste site has been divided into four subsites. Subsite 1 is the below-grade structures and underlying soils beneath the ancillary structures and has been Interim Closed Out. Subsite 2 is reactor core that has been placed in Interim Safe Storage (ISS). Subsite 3 is the underlying soil beneath the Fuel Storage Basin and has been Interim Closed Out. |
Subsite 4 is an area of contaminated soil west of the boundary of the Fuel Storage Basin excavation (118-F-8:3) and has been Interim Closed Out.

**Location:** The site is located in the southeastern corner of the 100F Area.

**Process Description:** Water from the Columbia River was extensively treated before passing through the reactor. It then circulated in a single pass through the reactor process tubes, cooling tubes imbedded in the thermal shield, and reactor horizontal control rods. After exiting the reactor, the cooling water passed through a retention basin and was then discharged to the river. During reactor operations, fuel cladding failures sometimes occurred while the fuel elements were in the process tubes. The first such cladding failure in any reactor occurred at the F Reactor in 1948. Over the operational lifetime of the reactor, there were several hundred such cladding failures. When fuel cladding failed, the cooling water in the affected process tubes became highly contaminated and elevated radiation levels were observed in the cooling water exiting the reactor core. This highly contaminated water was diverted to a trench for ground disposal rather than to the Columbia River. During reactor operations and reactor shutdowns, large quantities of decontamination solutions were used routinely to remove radionuclides from reactor equipment and facility surfaces. Decontamination activities took place at the dummy decontamination facility wash pad, which was adjacent to the fuel storage basin. Known decontamination solutions included chromic acid, citric acid, oxalic acid, nitric acid, sulfamic acid, sulfuric acid, and sodium fluoride. Other chemicals, including organic solvents, were also used for some decontamination processes. The reactor had many safety and control mechanisms. The function of the horizontal control rods (HCRs) was to control the equilibrium and transient power levels of the reactor during routine operations and to maintain the desired neutron flux distribution. The HCRs were each about 11.0 meters (36 feet) long, with the poison (neutron absorbing) segment being about 8.96 meters (29.4 feet) long. Two of the rods were electrically driven and seven were hydraulically driven. The latter were known as shim rods and were used to achieve ongoing operational control and desired fluctuations. The vertical safety rods (VSRs) were 11.9-meter (39-foot) long, stainless steel sleeves with 0.74-millimeter (3/16-inch) thick born stainless steel sleeves inside. Each VSR was inserted and withdrawn from the reactor via two separate cables wound around a winch located 12.2 meters (40 feet) above the top of the reactor. In cases of automatic shutdown ("scram") of the reactor, the electromagnetic clutch holding each rod would be deenergized (demagnetized), and the rods would free fall by gravity into channels penetrating the reactor. A "last ditch" safety system, a boric acid solution, was held in a large pedestal tank at the top of each reactor and connected to each of the 29 VSR channels via 1.27-centimeter (0.5-inch) pipes. The liquid boron system was later replaced by a system that used solid boron steel and carbon steel balls (Ball 3X System). The normal method for reactor refueling was displacement charge-discharge during reactor shutdown. During a refueling operation, the tubes to be discharged had their rear nozzle caps removed. New fuel elements were pushed into the process tube by a charging machine which caused the irradiated fuel elements in the tube to be displaced. The displaced irradiated fuel elements dropped into a water filled discharge chute and slid down into the metal pickup area at the end of the storage basin. The 6.1 meters (20 feet) of water in the chute area provided shielding as the elements accumulated and were sorted into buckets using long, hand-operated tongs. The buckets were then transferred by an overhead monorail system to the storage aisles where they were held for a time to allow the decay of short-lived radionuclides. Following the storage period, the buckets of fuel elements were moved by the overhead monorail system to the transfer area. At the transfer area, the irradiated fuel was loaded into a cask, then raised by a crane and placed in special railroad cars for shipment to the chemical reprocessing facilities in the 200 Area.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** Before remediation and ISS the unit contained an estimated 16,000 curies of radionuclides, 85,300 kilograms (94 tons) of lead, and 13.6 kilograms (30 pounds) of cadmium.
Waste Type: Misc. Trash and Debris

Waste Description: The site was estimated to contain less than 2.83 cubic meters (100 cubic feet) of asbestos.

Type: Reactor

Status: Inactive

Description: This subsite has been remediated and Interim Closed Out. It included the reactor ancillary support areas, below-grade structures and underlying soils beneath the support areas. The ancillary support areas consisted of the office areas, the reactor control room, tool storage rooms, restrooms, cooling water influent areas, change rooms, ventilation equipment areas, and electrical systems areas.

The remediation area was divided into four zones based on process history and structure depth.

Zone 1 was the underlying soils beneath the Fuel Storage Basin and that is also 118-F-8:3 (subsite 3). The 118-F-8:1 subsite was divided into three zones (Zones 2, 3, and 4).

Zone 2 consisted of the below-grade valve pit, located in the northern portion of the 105-F Reactor Building. It was constructed of poured reinforced concrete with wall thickness ranging from 0.9 to 1.5 meters (3 to 5 ft). The floor of the valve pit was approximately 4.8 meters (15.7 ft) below surrounding grade. During operation of the reactor, pre-reactor cooling water pipelines from the 190 Building entered the 105-F Reactor Building at the valve pit. Additional pipelines carried emergency raw water to the 105-F Reactor Building via the valve pit. Cooling water was distributed to two 91 centimeter (36 in.) diameter pipes that ran to the reactor base for distribution to the reactor block. The valve pit contained the valves and piping necessary to distribute cooling water to the reactor. Interior building floor drains were routed into the valve pit. The valve pit also contained recirculation pumps and components for the solids feed system.

Zone 3 consisted of the shallow (less than 4.6 meter [15 ft] below surface grade) below-grade structures. The Zone 3 structures were the solids feed area, the east water tunnel, the trench under the accumulator room, the gas recirculation tunnel, and the flow laboratory basement. The solids feed area housed a system that was used to inject a slurry of diatomaceous earth into the reactor cooling water to scour the corrosion film from the inner surfaces of the piping, process tubes and fuel elements to reduce friction losses in the system. The solids feed area also...
contained a sodium dichromate feed tank. The east water tunnel was a pipe tunnel used for piping between the valve pit and the reactor block. The trench under the accumulator room and the flow laboratory basement contained miscellaneous piping.

Zone 4 consisted of the deep (greater than 4.6 meter [15 ft] below surface grade) below grade structures. The Zone 4 structures were the east and west cooling water inlet tunnels, the 315 exhaust plenum, the 316 exhaust plenum, the pipe tunnel, and the southeast tunnel. The east and west inlet water tunnels contained the cooling water pipelines entering into the valve pit. The 315 and 316 exhaust plenums were part of the reactor building exhaust system. The pipe tunnel contained piping for the closed loop reactor block gas system. The southeast tunnel contained reactor cooling water piping.

**Closure Info:** The remediation area was divided into four zones based on process history and structure depth. The 118-F-8:3 was the underlying soils beneath the Fuel Storage Basin and was Zone 1. The 118-F-8:1 was divided into the other zones (Zones 2, 3, and 4).

Removal and disposal activities at the 105-F site began in 1999 and concluded in December 2003. Excavation of the site involved removing the building structures, debris, and underlying contaminated soil. The 105-F D&D activities resulted in removal of above and below-grade structures outside of the 105-F Reactor core shield walls to a minimum of 0.9 meters (3 ft) below surrounding grade. Approximately 22,132 metric tons (24,345 tons) of contaminated materials were disposed of at ERDF. The equipment decontamination pads were areas where decontamination of equipment occurred during the removal actions and ISS activities. In 2003, approximately 1 meter (3.3 ft) of contaminated soil from equipment decontamination activities was removed and disposed of at ERDF.

Zone 1 was soil beneath the fuel storage basin (FSB), located on the south side of the 105-F Reactor Building. The FSB held treated water and served as an underwater collection, storage and transfer facility for irradiated fuel elements discharged from the reactor. The FSB was approximately 23.8 by 21.6 by 6.4 meters (78 by 71 by 21 ft) deep. Deactivation of the storage basin occurred in 1970. Deactivation was accomplished by pumping the majority of the water from the basin and filling with sand. The Zone 1 Fuel Storage Basin was excavated and removed in 2003. The south and east portions of the FSB excavation are not included in this activity. They were remediated with the adjacent 100-F-19:2 pipeline excavation. Contaminated soil on the western side of the FSB became subsite 118-F-8:4. Remediation of the 118-F-8:4 soil area was deferred by the D&D Project to the Remedial Action Project to be completed at a later date (see CVP-2007-00004).

Zone 2 was the valve pit walls. They were removed to a minimum of 0.9 meters (3 ft) below the surrounding surface grade. Because of elevated levels of hexavalent chromium and polychlorinated biphenyls (PCBs) in the valve pit floor, the concrete floor was removed and disposed of at ERDF. The floor of the Zone 2 valve pit was located 4.8 meters (15.8 ft) below surrounding grade. The soils underlying the former floor were sampled and analyzed for hexavalent chromium and PCBs.

Zone 3 included the shallow zone structures (4.6 meters [15 ft] or less below ground surface). It included the solids feed area, the gas recirculation tunnel, the trench under the accumulator room, the east water tunnel, and the flow laboratory basement. The gas recirculation tunnel was removed so that the underlying pipe tunnel (in Zone 4) could be accessed. All of the other below-grade walls, including ceilings, associated with the Zone 3 structures were removed to a minimum of 0.9 meters (3 ft) below the surrounding grade. Because of elevated levels of hexavalent chromium, the solids feed area concrete floor was removed and disposed of at ERDF. The former floors of the solids feed area and the gas recirculation tunnel were located, at respective depths of 3.4 meters (11 ft) and 4.4 meters (14.5 ft). The floors of the trench under the accumulator room, the east water tunnel, and the flow laboratory are located at the
respective depths of 4.4 meters (14.5 ft), 3.8 meters (12.5 ft) and 3 meters (10 ft) below surrounding grade. The soils underlying the former solids feed area floor were sampled and analyzed for hexavalent chromium.

Zone 4 included the deep zone structures. The concrete floors of the Zone 4 structures were within the deep zone (greater than 4.6 meters [15 ft] below ground surface). Zone 4 included the east and west inlet water tunnels, the pipe tunnel, the 315 and 316 exhaust plenums, and the southeast tunnel. All of the concrete ceilings associated with zone 4 structures were removed. All of the Zone 4 walls were removed to a minimum of 0.9 meters (3 ft) below the surrounding surface grade. None of the Zone 4 concrete floors required removal and were left in place. The floors of the east and west inlet water tunnels, the pipe tunnel, the 315 plenum, the 316 plenum, and the southeast tunnel were located at the respective depths of 4.6 meters (15 ft), 5 meters (16.5 ft), 4.9 meters (16 ft), 5 meters (16.5 ft) and 6.1 meters (20 ft) below surrounding grade.

Because the removal of the 100-F-10 French Drain was inadvertently omitted from the 100-F-19:2 pipeline Closeout Verification Package (CVP-2001-00003) report, the activity was included in the 118-F-8:1 and 118-F-8:3 report (CVP-2003-00017) to document the french drain's reclassification to Interim Closed Out. The 100-F-10 French Drain was completely removed during excavation of the 100-F-19:2 pipelines. The cleanup verification sampling results for the 100-F-10 French Drain are included in the CVP-2001-00003 report.

Description: 118-F-8:2 subsite is the 105-F Reactor that has been placed in Interim Safe Storage (ISS). The 105-F Reactor was shut down on June 25, 1965. Until the start of the Interim Safe Storage (ISS) Project, the 105-F Reactor had been in a condition of minimum surveillance and maintenance.

Interim Safe Storage (ISS) of the 105-F Reactor included removing all portions of the reactor facility outside of the reactor block shield walls and construction of the safe storage enclosure (SSE), which required the installation of a new roofing system, power and lighting, a remote monitoring system, and ventilation components. The 105-F ISS Project began January of 1998 and was completed in September 2003. The primary objective of the 105-F Reactor ISS Project is to provide storage for up to 75 years with minimal maintenance required. Interim inspection are required only on a 5-year frequency. Access to the 105-F Reactor SSE is through the utility room. During periods of storage, the door to the SSE (located inside the utility room) will be locked and welded shut. The 0.9 to 1.5 meter (3 to 5 ft) thick concrete walls and the welded door provide the security barrier for the facility.

The original footprint area of the reactor building was approximately 4,994 square meters (53,750 sq. ft.). The final footprint area of the safe storage enclosure is 999 square meters (10,750 sq. ft.). Thus, the footprint area of the reactor was reduced by 80%. The footprint area is strictly the at-grade area and does not include the square footage of any above-grade rooms (e.g., sample rooms, ready room, upper electrical room, or exhaust plenums) or below-grade rooms/tunnels. The new steel roof decking was covered with foam and two applications of Hanford Site Waste Management Units Report
February 2015
Location: The site is located in the southeastern corner of the 100F Area.

The SubSite is Part Of:
Code: 118-F-8
Names: 118-F-8; 105-F Reactor Building

Code: 118-F-8:3
Names: 118-F-8:3; 105-F Reactor Fuel Storage Basin Underlying Soils
Type: Reactor
Status: Inactive
Description: The subsite has been remediated and Interim Closed Out. The 118-F-8:3 (remediation area Zone 1) was the soil beneath the fuel storage basin (FSB). The soil on the south and east sides of the basin that were adjacent to the pipeline in 100-F-19:2 were addressed with the pipeline remediation (see CVP-2001-00003). Contaminated soil on the west side of the fuel storage base that required additional remediation became subsite 118-F-8:4 and was addressed separately (see CVP-2007-00004).

Location: The fuel storage basin was located on the south side of the 105-F Building.

Related Sites/Structures: This subsite is associated with additional contaminated soil on the western edge of this excavation, known as 118-F-3:4.

Process Description: The Fuel Storage Basin was the underwater collection, storage, and transfer facility for irradiated fuel elements discharged from the reactor.

Closure Info: The remediation area was divided into four zones based on process history and structure depth. The 118-F-8:3 was the underlying soils beneath the Fuel Storage Basin and was Zone 1. The 118-F-8:1 was divided into the other zones (Zones 2, 3, and 4).

Removal and disposal activities at the 105-F site began in 1999 and concluded in December 2003. Excavation of the site involved removing the building structures, debris, and underlying contaminated soil. The 105-F D&D activities resulted in removal of above and below-grade structures outside of the 105-F Reactor core shield walls to a minimum of 0.9 meters (3 ft) below surrounding grade. Approximately 22,132 metric tons (24,345 tons) of contaminated materials were disposed of at ERDF. The equipment decontamination pads were areas where decontamination of equipment occurred during the removal actions and ISS activities. In 2003, approximately 1 meter (3.3 ft) of contaminated soil from equipment decontamination activities was removed and disposed of at ERDF.

Zone 1 was soil beneath the fuel storage basin (FSB), located on the south side of the 105-F Reactor Building. The FSB held treated water and served as an underwater collection, storage and transfer facility for irradiated fuel elements discharged from the reactor. The FSB was approximately 23.8 by 21.6 by 6.4 meters (78 by 71 by 21 ft) deep. Deactivation of the storage basin occurred in 1970. Deactivation was accomplished by pumping the majority of the water from the basin and filling with sand. The Zone 1 Fuel Storage Basin was excavated and removed in 2003. The south and east portions of the FSB excavation are not included in this activity. They were remediated with the adjacent 100-F-19:2 pipeline excavation. Contaminated soil on the western side of the FSB became subsite 118-F-8:4. Remediation of the 118-F-8:4 soil area was deferred by the D&D Project to the Remedial Action Project to be completed at a later date (see CVP-2007-00004).
Zone 2 was the valve pit walls. They were removed to a minimum of 0.9 meters (3 ft) below the surrounding surface grade. Because of elevated levels of hexavalent chromium and polychlorinated biphenyls (PCBs) in the valve pit floor, the concrete floor was removed and disposed of at ERDF. The floor of the Zone 2 valve pit was located 4.8 meters (15.8 ft) below surrounding grade. The soils underlying the former floor were sampled and analyzed for hexavalent chromium and PCBs.

Zone 3 included the shallow zone structures (4.6 meters [15 ft] or less below ground surface). It included the solids feed area, the gas recirculation tunnel, the trench under the accumulator room, the east water tunnel, and the flow laboratory basement. The gas recirculation tunnel was removed so that the underlying pipe tunnel (in Zone 4) could be accessed. All of the other below-grade walls, including ceilings, associated with the Zone 3 structures were removed to a minimum of 0.9 meters (3 ft) below the surrounding grade. Because of elevated levels of hexavalent chromium, the solids feed area concrete floor was removed and disposed of at ERDF. The former floors of the solids feed area and the gas recirculation tunnel were located, at respective depths of 3.4 meters (11 ft) and 4.4 meters (14.5 ft). The floors of the trench under the accumulator room, the east water tunnel, and the flow laboratory are located at the respective depths of 4.4 meters (14.5 ft), 3.8 meters (12.5 ft) and 3 meters (10 ft) below surrounding grade. The soils underlying the former solids feed area floor were sampled and analyzed for hexavalent chromium.

Zone 4 included the deep zone structures. The concrete floors of the Zone 4 structures were within the deep zone (greater than 4.6 meters [15 ft] below ground surface). Zone 4 included the east and west inlet water tunnels, the pipe tunnel, the 315 and 316 exhaust plenums, and the southeast tunnel. All of the concrete ceilings associated with zone 4 structures were removed. All of the Zone 4 walls were removed to a minimum of 0.9 meters (3 ft) below the surrounding surface grade. None of the Zone 4 concrete floors required removal and were left in place. The floors of the east and west inlet water tunnels, the pipe tunnel, the 315 plenum, the 316 plenum, and the southeast tunnel were located at the respective depths of 4.6 meters (15 ft), 5 meters (16.5 ft), 4.9 meters (16 ft), 5 meters (16.5 ft) and 6.1 meters (20 ft) below surrounding grade.

Because the removal of the 100-F-10 French Drain was inadvertently omitted from the 100-F-19:2 pipeline Closeout Verification Package (CVP-2001-00003) report, the activity was included in the 118-F-8:1 and 118-F-8:3 report (CVP-2003-00017) to document the french drain's reclassification to Interim Closed Out. The 100-F-10 French Drain was completely removed during excavation of the 100-F-19:2 pipelines. The cleanup verification sampling results for the 100-F-10 French Drain are included in the CVP-2001-00003 report.

The SubSite is Part Of:
Code: 118-F-8
Names: 118-F-8; 105-F Reactor Building

Code: 118-F-8:4
Names: 118-F-8:4; 105-F Fuel Storage Basin West Side Adjacent and Side Slope Soils
Type: Reactor
Status: Inactive
Description: This subsite has been remediated and Interim Closed Out. It consisted of an area of contaminated soil in the western boundary of the Fuel Storage Basin excavation. It was identified during the remediation activities at 118-F-8:1 and 118-F-8:3 and remediated in 2007.
Location: This area was located southwest of the 105-F reactor, on the western boundary of the Fuel Storage Basin excavation.
Storage Basin.

Related Sites/Structures: This subsite is associated with 118-F-3:3 and pipeline site 100-F-19:2.

Closure Info: Remediation of the subsite began on March 14, 2007, and was completed on June 22, 2007. Remedial action activities involved removing the uncontaminated overburden, the buried contaminated material, and the underlying contaminated soil for disposal. Excavation involved removing the uncontaminated overburden and underlying contaminated soil. Initial verification sampling results showed one area of the overburden stockpiles had elevated carbon-14 levels. Additional soil was removed and disposed. The area was re-sampled on October 22, 2007 and passed cleanup criteria. At the conclusion of remediation activities, deepest part of the excavation was approximately 8 meters (26 ft) below ground surface. No anomalies or stained soil were discovered during remediation.

Approximately 2,950 bank cubic meters (BCM) of overburden was stockpiled. Approximately 1,650 bank cubic meters (BCM) of contaminated soil was disposed at ERDF. The maximum depth of excavation was approximately 8 meters (26 feet) below ground surface.

The 118-F-8:4 subsite has been verified to meet protectiveness standards in accordance with the Action Memorandum. In accordance with this evaluation, the verification sampling and modeling results support a reclassification of the site to Interim Closed Out.

The SubSite is Part Of:

Code: 118-F-8
Names: 118-F-8; 105-F Reactor Building

Type: Unplanned Release
Status: Inactive
Description: The waste site is an area of radiological surface contamination along the Columbia River embankment, southeast of the 107-H Retention Basin. The area was resurveyed and posted as a Surface Contamination Area in May 2012.
Location: The site is located approximately 150 meters (432 feet) southeast of the 107-H Retention Basin. The site is along the Columbia River embankment. The location with the maximum gamma readings is at coordinates E578294.96/N152528.72.
Waste Type: Steam Condensate
Waste Description: The site is an area of elevated radiological activity, generally less than twice background measurements, as shown in the GPERS survey report plot.

Type: Product Piping
Status: Inactive
Description: The waste site was evaluated and determine to require No Action. The site consists of seventeen
100-H Area miscellaneous pipeline segments not associated with an existing waste site. Some segments were discovered during a spatial analysis of the pipeline mapping. Some pipeline segments were either not assigned to waste sites or incorrectly assigned to a waste site. Some pipeline segments were added during field remediation activities. Some segments were removed from this site because they were addressed with other waste sites.

The following pipeline segments were originally included in this waste site:

(1) The 15.2 cm (6 in) cast iron sanitary sewer services the 181-H building. It carried sanitary waste to the 1607-H4 septic tank and drain field (M-1904-H sh 1, P-1211).
(2) The 5.08 cm (2 in) steel pipeline carried filtered water from the Brine Pump House to the coal conveyor. The water supply originated from the 184-H Power House and traveled to the Brine Pump House through a 7.62 cm (3 in) steel filtered water line (100-H-51:3) before connecting to the 5.08 cm (2 in) steel filtered water pipeline (P-1418, P-1419).
(3) The 2.54 cm (1 in) soft water line from the elevated water tower to the 184-H power house (P-1426, P-1216). (Addressed with 100-H-28:3)
(4) The 10.16 cm (4 in) schedule 40 steel water line supplied filtered water from the elevated water tank 187-H1 to the 119-H Sample Building (H-1-19805, H-1-19812, H-1-19849).
(5) The 30.48 cm (12 in) filtered water line supplies water from the elevated storage tank 187-H1 to the 105-H Building (H-1-13254).
(6) The 40.64 cm (16 in) filtered water line supplies water from the elevated storage tank 187-H1 and the 105-H Building (H-1-13254, P-4750, P-1221). Purportedly a 500 parts per million dichromate solution was added to the water left in the pipeline during descaling of the 105 High Tank piping in 1960 (HW-65726 SUPD).
(7) The 15.2 cm (6 in) vitrified clay pipe sanitary sewer connects the south side of the 105-H building with 100-H-28:4 (H-1-19805). (Addressed with 132-H-3)
(8) The 15.2 cm (6 in) vitrified clay pipe connects the 110-H building with the sanitary sewer trench (100-H-30) (H-1-19824).
(9) The 3.8 cm (1.5 in) steel sanitary water pipe connects the 110-H building with the sanitary supply leading into the east side of the 1608-H building (H-1-19805, H-1-19812, H-1-70246). (Addressed with 132-H-3)
(10) The 40.6 cm (16 in) steel filtered water line supplies water from the elevated storage tank 187-H2 to the 105-H Building (H-1-13254, P-1220). Approximately 500 parts per million dichromate solution was added to the water remaining in the pipeline during descaling of the 105 High Tank piping in 1960 (HW-65726 SUPD).
(11) The 10.16 cm (4 in) sanitary sewer connects the paint shop (1722-H) with 100-H-28:2.
(12) The 2.54 cm (1 in) pipeline near 100-H-55. It is assumed to be a service water line.
(13) A concrete encased pipe was discovered running between E577797/N152419 and E577831/N152418. It was discovered during remediation of the 105-H Decontamination Pads (118-H-6:5) in July 2009.
(14) A 15.2 cm (6 in) thin walled aluminum pipeline set in concrete running east/west near 600-152. It resembles an irrigation pipe.
(15) Temporary construction sewer line, septic tank and drain field west of 151-H (HW-24800-2, photo 2045).
(16) A 15.2 cm (6 in) cast iron pipe discovered during excavation of 100-H-4 in January 2010.
(17) A 1.9 cm (0.75 in) sodium silicate line from the storage tank in the 190-H Building to the 187-H2 Elevated Water Tower (H-1-13254).

NOTE: Two sewer pipelines (7 and 9) were removed with the 132-H-3 waste site. Pipeline 3 was inside the 100-H-28:3 subsite excavation and sampled from the bottom of the 100-H-28:3 excavation. Four sewer lines (1, 8, 11, and 15) will be in a Remove, Treat, Dispose report.

Location:

(1) End coordinates N153474.45, E577535.22 and N153434.55, E577551.95. The 15-cm (6-in.) cast iron pipeline carried sanitary waste to the 1607-H4 septic tank.
(2) End coordinates N152944.97, E577455.58 and N152998.08, E577455.58. The 5-cm (2-in.) steel pipeline carried water from the brine pump house to the coal conveyor. The water supply
originated from the 184-H Power House and traveled to the brine pump house through the 100-H-53.3 subsite.

(3) End coordinates N152937.94, E577527.96 and N152972.67, E577525.05. The 2.5-cm (1-in.) steel soft water line runs from the elevated water tower to the 184-H Power House.

(4) End coordinates N152553.08, E577687.81 and N152500.00, E577730.23. The 10-cm (4-in.) and 1.9-cm (0.75-in.) steel pipeline carried filtered water from elevated water tank 187-H1 to the 119-H Sample Building.

(5) End coordinates N152551.11, E577686.91 and N152553.57, E577771.68. The 30-cm (12-in.) pipeline carried filtered water from elevated water tank 187-H1 to the 105-H Sample Building.

(6) End coordinates N152555.06, E577690.42 and N152558.53, E577766.78. The 40.6-cm (16-in.) pipeline carried filtered water from elevated water tank 187-H1 to the 105-H Sample Building.

(7) End coordinates N152497.87, E577681.05 and N152506.51, E577753.69. The 15-cm (6-in.) vitrified clay pipeline was within the boundary and taken out with the 132-H-3 waste site.

(8) End coordinates N152451.66, E577728.13 and N152401.09, E577748.81. The 15-cm (6-in.) vitrified clay pipe connects the 110-H Building with the sanitary sewer trench (100-H-30 waste site).

(9) End coordinates N152479.46, E577745.75 and N152451.59, E577730.33. The 3.8-cm (1.5-in.) steel sanitary water pipe connected the 110-H Building with the sanitary sewer line leading into the east side of the 1608-H Building. This pipe was within the boundary of the 132-H-3 waste site and was taken out with that excavation.

(10) End coordinates N152547.47, E577798.95 and N152550.90, E577841.31. The 40.6-cm. (16-in.) steel pipeline carried filtered water from elevated water tank 187-H2 to the 105-H Building. Allegedly 500 parts per million dichromate solution was added to the water left in the pipeline during descaling of the 105 high tank piping in 1960. After chemically descaling the tanks and the lines in 1960 and 1961, a sodium silicate injection system was added for the high tanks. A sodium silicate tank was installed in the 190-H Building, and silicate was added directly into the fill lines for the 187-H High Tanks.

(11) End coordinates N152655.44, E577974.51 and N152652.88, E577983.39. The 10-cm? (4-in.) vitrified clay sanitary sewer line connects the 1722-H Building with the 100-H-28:2 subsite.

(12) End coordinates N153434.19, E576892.43 and N153434.18, E576905.77. The 2.5-cm (1-in.) cast iron service water line is located near the 100-H-55 waste site.

(13) End coordinates N152419.00, E577797.00 and N152418.00, E577831.00. The concrete-encased pipe was found during remediation of the 105-H Decontamination Pads in July 2009.

(14) End coordinates N153591.57, E576881.05 and N153589.19, E576958.70. The 10-cm (4-in.) aluminum resembles an irrigation pipe running east/west near the 600-152 waste site. Thin-walled with concrete set around it.

(15) End coordinates N152509.32, E577553.38 and N152509.34, E577405.98. Temporary construction sewer line, septic tank, and drain field west of the 151-H Building. Sewer line from the 100-H-28:4 subsite.

(16) End coordinates N152604.50, E577975.70 and N152605.50, E578007.30. The 15-cm (6-
in.) cast iron pipe was discovered during excavation of the 100-H-4 waste site in January 2010.

(17) End coordinates N152558.86, E577792.40 and N152553.82, E577836.80. The 1.9-cm (0.75-in.) sodium silicate pipe runs from a storage tank in the 190-H Building to the 187-H2 elevated water tower.

**Process Description:**
There is no process history associated with the 100-H-56 waste site.

**Closure Info:**
- On June 21, 2013, excavation was started at Test Pit 8 with one sample taken at 4 meters (13 ft) below ground surface (bgs) and one sample taken at 4.6 meters (15 ft) bgs, no pipe was found at this excavation.
- On June 28, 2013, Test Pit 1 was excavated to native soil where primary and duplicate samples were taken at a depth of 3 meters (10 ft) bgs. No pipe was found.
- On July 1, 2013, Test Pit 2 was excavated to a depth of 4.6 meters (15 ft) bgs, and no pipe was visible. A sample was taken at the base of the excavation.
- On July 2, 2013 Test Pits 7 and 10 were excavated. A pipe was encountered at 1.1 meter (3.5 ft) bgs in Test Pit 10. A sample was taken below the pipe. No sample was collected from inside the pipe due to the pipe being crimped. Along with the crimped pipe found in the side wall, a 0.76 meters (2.5 ft) section of pipe was found in the excavation. However, according to the logbook, nothing was inside the pipe to be sampled. No staining was encountered.
- Test Pit 7 was excavated to a depth of 4.6 meters (15 ft) bgs and sampled. No pipe was encountered.
- On July 8, 2013, Test Trench 6 was excavated and sampled at a depth of 4.6 meters (15 ft). No pipe was encountered. Test Pit 9 were excavated to a depth of 1.8 meters (6 ft) bgs. The duct bank runs east/west and is approximately 0.3 meters (1 ft) thick and 0.9 meters (3 ft) wide. The crew and engineer were confident that this resembles previous electrical duct banks encountered at the 100-D, 100-F, and 300 Areas. The amount of concrete used makes it unlikely that there is just a pipe inside. One sample was taken from underneath the electrical duct bank.
- On July 16, 2013 test trench 5 that was excavated to a depth of 4.6 meters (15 ft) bgs. No pipe was found. One soil sample was taken at the bottom of the excavation.
- On March 5, 2014, two pipes were encountered during excavation of Test Pit 3 (a 2.5 cm (1 in.) diameter pipe running east-west about 0.6 meters (2 ft) bgs and a 5 cm (2 in.) pipe running north-south about 1.2 or 1.5 meters (4 or 5 ft) bgs. Both pipes were open and empty. A sample from underneath the pipes at about 1.5 meters (5 ft) bgs was taken.
- On March 5, 2014, Test Pit 4 was excavated. A 5 cm (2 in.) diameter pipe at 1.2 meters (4 ft) bgs was encountered. This pipe was wrapped in thermal system insulation asbestos material and had been disturbed by the excavator during the excavation. The area was stabilized, properly posted, and the excavator was properly decontaminated. It was determined that the pipe was a steam line and therefore nonhazardous. The steam line was left in place.
- On March 31, 2014, in a continuing effort to find the pipe and/or collect a soil sample from the pipes location a sample was taken approximately 3 meters (10 ft) bgs at the 100-H-28:3 excavation. This sample took the place of the original TP-4 sample and is located where pipeline 3 would have entered the 100-H-28:3 pipeline. The soft water pipeline was never found.

**Names:** 100-H-59; 100-H Area Railroad Track Soil Contamination Area

**Type:** Unplanned Release

**Status:** Inactive

**Description:**
The site consists of contaminated soil discovered during the removal of the rail at the 100-H project. A 213 meter (700 foot) long trench of contaminated railroad bed, including 39 rails, 700 ties, and scattered debris in 25 piles, remains. The contaminated area is about 3,250 square meters (35,000 square feet). The railroad berm tapers from 2.6 meters (8.5 feet) to 0.3 meters (1 foot) above original grade.

**Location:** This site is along a railroad bed in the 100-H Area south and west of the 105-H Reactor.

**Process Description:** There is no process history associated with the 100-H-59 waste site.

</tr>
</tbody>
</table>

**Names:** 118-H-6; 105-H Reactor Building

**Type:** Reactor

**Status:** Inactive

**Description:**
The waste site consists of the 105-H Reactor building that has been divided into six subsites. All of the subsites, with the exception of the Reactor Core (subsite 1), have been Interim Closed Out. Subsite: 1 is the 105-H Reactor Core and Interim Safe Storage (ISS) Project. Subsite 2 is the 105-H Ancillary Support Areas, Below-Grade Structures and Underlying Soils. Subsite 3 is 105-H Reactor Fuel Storage Basin and Underlying Soils. Subsite 4 is the 105-H Fuel Storage Basin Shallow Zone Side Slope Soils. Subsite 5 is the 105-H Decontamination Pads. Subsite 6 is the Deep Zone Side Slopes.

The reactor area was divided into five Demolition Zones. Demolition Zone 1 was on the west side of the reactor building. It included the 316 gas plenum, drying rooms, filter rooms and exhaust fans. Demolition Zone 2 was on the south side of the reactor building. It included the fuel storage basin, the was pad and transfer bay areas. Demolition Zone 3 was on the northeast side...
corner of the reactor building. It included the control room, the instrument repair room and the
lunch room, offices and corridors. Demolition Zone 4 was on the southeast corner of the reactor
building. It included the outer rod room, corridor #3 and storage rooms. The battery room and
electrical room were below grade. It also included a concrete ramp. Demolition Zone 5 was on
the north and west sides of the reactor building. It included several equipment rooms and
storage rooms along with the influent cooling water tunnels.

Location: The 105-H Reactor was located in the 100-H Area of the Hanford Site in southeastern
Washington State.

Release Description: It was suspected that the irradiated fuel storage basin leaked for a number of years prior to
deactivation. The leak rate was small, and the location of the leak was never identified.

Process Description: The 105-H Reactor was one of eight single-pass plutonium production reactors built along the
Columbia River. Construction of the 105-H Reactor began in March 1948 with operations
commencing on October 29, 1949. The 105-H Reactor was shut down in April 1965. During
the shutdown activities it was determined that the FSB had leaked. A Record of Decision
(ROD) was issued by the U.S. Department of Energy (DOE) (58 Federal Register 48509). The
ROD alternative selected was to place the reactors into a safe storage condition for up to 75
years. After Interim Safe Storage (ISS), the reactors would be transported in one piece to a
specially prepared burial facility in the 200 West Area of the Hanford Site.

Miscellaneous process equipment and sludge was left in the basin, and the sludge was stabilized
in place in 1970 with approximately 6 meters (20 feet) of soil backfill. In the years following
deactivation, several other significant cleanup efforts were completed at the 105-H Reactor
complex. These included the 1983 demolition of the 116-H reactor exhaust stack and above-
grade exhaust ducting and the 1984 demolition of the 117-H exhaust air filter building.

Waste Type: Barrels/Drums/Buckets/Cans

Waste Description: The primary source of contamination at the site was reactor coolant water and water in the Fuel
Storage Basin that became contaminated through contact with irradiated and ruptured fuel
elements and components from the reactor cooling system. In 1987 the basin contained an
estimated 15,000 curies of radionuclides, 102,000 kilograms (112 tons) of lead, less than 2.8
cubic meters (100 cubic feet) of asbestos, and 9 kilograms (20 pounds) of cadmium.

**Names:** 118-H-6:1; 105-H Reactor Core and ISS Project  
**Reclassification:** None  

**Type:** Reactor  
**Start Date:**  

**Status:** Inactive  
**End Date:**  

**Description:** The 105-H Reactor core Interim Safe Storage (ISS) project began in 2000 and continued to 2005. The D&D project included characterization, engineering, removal of hazardous and radiologically contaminated materials, equipment removal, decontamination, demolition of the structure, and restoration of the site. The ISS activities included construction of the safe storage enclosure (SSE), which required the installation of a new roofing system, power and lighting, a remote monitoring system, and ventilation components. The original footprint area of the 105-H Reactor Building was approximately 6,934 square meters (74,640 square feet). The final ground-level footprint area of the safe storage enclosure (SSE) is 1,387 square meters (14,928 square feet). The exterior contaminated areas of the reactor building that have been removed and disposed in ERDF represent 80% of the original footprint of the reactor building.

As much as was practical, all objects and surface contamination were removed during the D&D activities. A new roof was added as part of the ISS effort. All doors were permanently sealed except for one door that remains locked and is welded shut. The only planned entrance to this structure is for surveillance and maintenance activities that will occur approximately every 5 years. The below-grade portions of the facility, outside the Safe Storage Enclosure, have been demolished, removed, and all below-grade areas backfilled to eliminate future subsidence.

**Location:** The 105-H Reactor was located in the 100-H Area.

**The SubSite is Part Of:**
**Code:** 118-H-6  
**Names:** 118-H-6; 105-H Reactor Building

---

**Names:** 118-H-6:2; 105-H Ancillary Support Structures and Underlying Soils; 105-H Below-Grade Structures and Underlying Soils  
**Reclassification:** Interim Closed Out (6/22/2006)  

**Type:** Reactor  
**Start Date:**  

**Status:** Inactive  
**End Date:**  

**Description:** The 118-H-6:2 Has been remediated and Interim Closed Out. It consisted of the 105-H Reactor ancillary support areas, below-grade structures, and underlying soils. During remediation, this subsite included Demolition Zones 1, 3, 4 and 5 located on the west, south, northeast and southeast portions of the ancillary reactor structures. The remediation area also included the 100-H-9, 100-H-10, 100-H-13 french drains.

**Closure Info:** Removal and disposal activities at the 105-H site (118-H-6:2, 118-H-6:3, 118-H-6:6 subsites) were completed in 2004. D&D activities, in preparation for the construction of the 105-H Reactor SSE, also resulted in the removal of 100-H-9, 100-H-10, 100-H-11, 100-H-12, 100-H-13, 100-H-14 french drains and the 100-H-31 electrical transformer soil. All materials from the 105-H Reactor ISS Project were demolished and disposed at ERDF. The overburden piles produced during excavation were found to be contaminated. The overburden was deemed unsuitable for use as backfill of the site and was removed to ERDF.

The site was backfilled with clean soil aggregate from the 100-D Area Borrow Pit 21 and graded to match the surrounding terrain. This 105-H D&D activity generated approximately 4,863 bulk containers of low-level contaminated material that were shipped to ERDF.
accounting for approximately 73,966 metric tons (81,365 tons).

Per the Sampling and Analysis Plan, the 105 H Reactor ancillary support areas and below-grade structures (118-H-6:2) did not require sampling and analysis because the structures were removed in their entirety and then disposed at the Environmental Restoration Disposal Facility (ERDF). During the D&D activities, an additional evaluation was required to determine if the soils under the Fuel Storage Basin (FSB) floor (118-H-6:3) had achieved the RAGs. The evaluation of the FSB soils and deep zone side-slope soils (118-H-6:6) also evaluated the soils under the 100-H-11, 100-H-12, and 100-H-14 waste sites. Radiological surveys and verification sampling analysis were performed on the FSB underlying soils and deep zone side-slope soils. The data was used with the RESRAD computer model to verify that cleanup criteria were satisfied. Localized contamination was removed in preparation for clean demolition, and a fixative was applied as required. With one exception, no below-grade structures remaining. The exception is a portion of the FSB floor, at its northern end between the two access labyrinths to the D elevator. It was not removed with this activity.

Verification soil samples were collected from soils under the FSB floor. All demolition debris from excavations associated with the activity was sent to ERDF. Final cleanup verification samples for the FSB underlying soils and deep zone side-slope soils were collected following evaluation of field screening for radiological contaminants using global positioning environmental radiological surveyor (GPERS) and laser-assisted ranging and data system (LARADS) surveys. This field screening was performed in order to obtain an initial assessment of attainment of radiological cleanup levels.

The remaining soils at the 105-H Reactor site were either been deferred to the Field Remediation Closure Project or have been shown to meet the applicable RAGs through verification sampling, analysis, and RESRAD modeling. All excavated materials generated during the D activities were disposed at ERDF, and the area was backfilled to grade with clean backfill. These results also indicate that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a rural-residential scenario and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

The three decontamination pads (118-H-6:5) and the Fuel Storage Basin shallow side-slope soils (118-H-6:4) were deferred to the Field Remediation Closure Project and remediated at a later date.

**Description:** The site has been remediated and Interim Closed Out. The 118-H-6:3 subsite was the soil beneath the 105-H Reactor Fuel Storage Basin and included the 100-H-11 french drain and the 100-H-14 soil contamination area.

During remediation, this subsite was known as Demolition Zone 2. This zone consisted of the control room, the instrument repair room, the lunch room, several offices, and several corridors. The only below-grade structure in this zone was the 106 corridor. The local contamination was
removed and a fixative was applied as required. All structures in this demolition zone were removed due to surface contamination being present. Per the 105-H Reactor Sample Analysis Plan, sampling of underlying soils was not required because structures in this demolition zone were not subjected to standing contaminated water. There was no mechanism for residual surface contamination to penetrate into the concrete and the underlying soil.

**Location:** Demolition Zone 2 was on the northeast corner of the original reactor building.

**Closure Info:** Removal and disposal activities at the 105-H site (118-H-6:2, 118-H-6:3, 118-H-6:6 subsites) were completed in 2004. D&D activities, in preparation for the construction of the 105-H Reactor SSE, also resulted in the removal of 100-H-9, 100-H-10, 100-H-11, 100-H-12, 100-H-13, 100-H-14 french drains and the 100-H-31 electrical transformer soil. All materials from the 105-H Reactor ISS Project were demolished and disposed at ERDF. The overburden piles produced during excavation were found to be contaminated. The overburden was deemed unsuitable for use as backfill of the site and was removed to ERDF.

The site was backfilled with clean soil aggregate from the 100-D Area Borrow Pit 21 and graded to match the surrounding terrain. This 105-H D&D activity generated approximately 4,863 bulk containers of low-level contaminated material that were shipped to ERDF, accounting for approximately 73,966 metric tons (81,365 tons).

Per the Sampling and Analysis Plan, the 105 H Reactor ancillary support areas and below-grade structures (118-H-6:2) did not require sampling and analysis because the structures were removed in their entirety and then disposed at the Environmental Restoration Disposal Facility (ERDF). During the D&D activities, an additional evaluation was required to determine if the soils under the Fuel Storage Basin (FSB) floor (118-H-6:3) had achieved the RAGs. The evaluation of the FSB soils and deep zone side-slope soils (118-H-6:6) also evaluated the soils under the 100-H-11, 100-H-12, and 100-H-14 waste sites. Radiological surveys and verification sampling analysis were performed on the FSB underlying soils and deep zone side-slope soils. The data was used with the RESRAD computer model to verify that cleanup criteria were satisfied. Localized contamination was removed in preparation for clean demolition, and a fixative was applied as required. With one exception, no below-grade structures remaining. The exception is a portion of the FSB floor, at its northern end between the two access labyrinths to the D elevator. It was not removed with this activity.

Verification soil samples were collected from soils under the FSB floor. All demolition debris from excavations associated with the activity was sent to ERDF. Final cleanup verification samples for the FSB underlying soils and deep zone side-slope soils were collected following evaluation of field screening for radiological contaminants using global positioning environmental radiological surveyor (GPERS) and laser-assisted ranging and data system (LARADS) surveys. This field screening was performed in order to obtain an initial assessment of attainment of radiological cleanup levels

The remaining soils at the 105-H Reactor site were either been deferred to the Field Remediation Closure Project or have been shown to meet the applicable RAGs through verification sampling, analysis, and RESRAD modeling. All excavated materials generated during the D activities were disposed at ERDF, and the area was backfilled to grade with clean backfill. These results also indicate that residual concentrations in the shallow zone will support future land uses that can be represented (or bounded) by a rural-residential scenario and that residual concentrations throughout the site pose no threat to groundwater or the Columbia River.

The three decontamination pads (118-H-6:5) and the Fuel Storage Basin shallow side-slope soils (118-H-6:4) were deferred to the Field Remediation Closure Project and remediated at a later date.

Names: 118-H-6:4; 105-H Fuel Storage Basin Shallow Zone Side Slope Soils

Type: Reactor
Status: Inactive

Description: The waste site has been remediated and Interim Closed Out. It encompassed the 118-H-6:4, 105-H Fuel Storage Basin Shallow Zone Side Slope Soils. Based on the results of the applicable cleanup verification package (CVP) document, authorization was given to remove the Soil Contamination Area and Underground Radioactive Material Area postings from this waste site.

Location: The 118-H-6:4 waste site was located on the south side of the 105-H Reactor Building.

Related Sites/Structures: This subsite is associated with the 100-H-37 contamination migration waste site.

Closure Info: In April 2004, the 118-H-6:4 Fuel Storage Basin (FSB) Shallow Zone Soil subsite was deferred to the Remedial Action Program to support the safe storage enclosure (SSE) replacement of the 105-H Building roof structure. Backfill and stabilization of the FSB excavation was required to accommodate the roof replacement. In March 2009, further remediation was performed at the 118-H-6:4 waste site resulting in newly exposed shallow zone side-slope soils requiring verification sampling. The side-slope soils in the 105-H FSB shallow zone were located from grade level to 4.6 meters (15 ft) below grade level. Remedial actions occurred in two stages. The first stage was conducted in 2004 during the D&D of the 105-H Reactor ancillary facilities and the FSB. In March 2004, verification samples indicated that radiological cleanup criteria had not been met in the FSB side-slope shallow zone. Further remediation was deferred to the Remedial Action Program to allow backfill and stabilization of the FSB excavation prior to the construction of the Safe Storage Enclosure for the reactor core. Excavation of subsite 4 was resumed on March 17, 2009 and continued through June 29, 2009. Approximately 4,096 bank cubic meters (BCM) (5,358 bank cubic yards [BCY]) of clean overburden material were removed and stockpiled to allow access the original (2004) excavation side-slope soil. Approximately 2,682 BCM (3,508 BCY) of contaminated shallow zone side-slope soil was excavated and direct loaded for disposal at the ERDF. No debris or anomalous material was found during the 2009 excavation.

Names: 118-H-6:5; 105-H Decontamination Pads
Type: Reactor
Status: Inactive

Description: The waste site has been remediated and Interim Closed Out. It consisted of three, irregularly shaped, decontamination (decon) pads that were created by the Environmental Restoration Contractor Decommissioning and Demolition Project during remedial activities. The decon pads consisted of compact level gravel areas where cranes and heavy equipment were staged to...
support the movement and decontamination of parts and equipment in support of the 105-H Reactor interim safe storage activities. Based on the results of the applicable cleanup verification package (CVP or RSVP) documents, authorization was given to remove the Soil Contamination Area and Underground Radioactive Material Area postings from this waste site.

**Location:** The decon pads were arranged in an arc on the south-southeast side of the 105-H SSE.

**Closure Info:** Remediation of the 118-H-6:5 waste subsite was performed from April 30 through September 30, 2009. Most of the soil was removed and disposed at the ERDF. The original size of each decon pad was slightly smaller than the area excavated. The excavation depth for each pad was approximately 1.0 to 2.0 meters (3.3 to 6.6 ft). Twelve samples were collected from each of the three pads. In March 2009, oily soil was excavated from the surface of the decon pads and the area between and around the decon pads, and stockpiled separately on the decon pad for waste characterization and removal. Following the main excavation, from July 15 through September 30, 2009, focused stained soil excavations occurred to a depth of 3.0 to 4.0 meters (9.8 to 13.1 ft) in the center decon pad.

Following sample analysis of the original excavation, it was determined that additional remediation was needed because three sample locations exceeded direct exposure cleanup criteria. On October 11, 2010 approximately 0.5 meters (2 ft) of soil was removed from a 3 meters (10 ft) diameter area at the west decon pad, WDP-12 sample location.

A portion of the west decon pad was excavated on November 16, 2009 to perform confirmatory sampling for the 100-H-39 (Rejected waste site). Two focused samples were collected from a test pit. The excavated soil was placed back into the test pit, and the area was leveled to match the grade of the remediated 118-H-6:5 west decon pad excavation.

<tr>
<td>Description:</td>
<td>The site has been remediated and Interim Closed Out. It consisted five small areas of red stained soil. Some of the material appeared crushed while other pieces looked like “slag.” Similar piles of material have been found south of the 200 West Area, 100-B Area, and Riverland (McGee Ranch) Area.</td>
</tr>
<tr>
<td>Location:</td>
<td>The site was located near the 118-K-1 Burial Ground. Three of the small areas were located in the gravel road that runs just southwest of the 118-K-1 Burial Ground. A fourth area is located on the berm between the gravel road and 126-K-1 Gravel Pit. The fifth area is located 154 meters (505 ft) northeast of 126-K-1.</td>
</tr>
</tbody>
</table>

The center coordinates of the five areas are:
Process Description: Crushed iron ore was a component of the concrete used in reactor and other facility construction, as it provided additional shielding. The material is highly magnetic. One sample result indicates 74,400 mg/kg iron, while the other sample indicates 103,000 mg/kg iron.

Waste Type: Equipment

Waste Description: The waste is areas of red stained soil. X-ray diffraction (XRF) was performed immediately upon identification of the site. The XRF results indicated the presence of arsenic and lead. Later, the site was sampled for inorganics at Lionville. The sample numbers are J15DV5 and J15DV6. Sample number J15DV5 indicated 62.9 mg/kg arsenic and sample number J15DV6 indicated 116 mg/kg arsenic. Lead was not indicated as a contaminant in these two samples. Eberline performed a gamma scan for selected radionuclides. All results were below cleanup limits. The site contaminant of potential concern (COPC) is arsenic.

Closure Info: Waste sites 100-K-84, 100-K-86, 100-K-87, 100-K-91, 100-K-92, 100-K-95 were evaluated and reclassified as a group in the same RSVP document.

Remediation of the waste sites began in November 2012 and was concluded in June 2013. Due to elevated residual concentrations of contaminants after the initial remediation(s), additional remediation was required for the 100-K-84, 100-K-87, and 100-K-95 waste sites. All materials removed from the excavations were disposed at the Environmental Restoration Disposal Facility (ERDF) via direct load out. No staging pile areas were associated with the waste sites.

The excavation at the 100-K-84 waste site began on November 5, 2012, and concluded on March 14, 2013. Approximately 2,695 bank cubic meters (BCM) (3,525 bank cubic yards [BCY]) of soil and rock were removed and disposed at ERDF. The maximum depth of the excavation was approximately 0.91 meters (3 ft) bgs.

The excavation at the 100-K-86 waste site began on November 13, 2012, and concluded on January 22, 2013. Approximately 342 BCM (447 BCY) of debris, soil, and rock were removed and disposed at ERDF. The maximum depth of the excavation was approximately 1.5 meters (5 ft) bgs.

The excavation at the 100-K-87 waste site began on February 26, 2013, and concluded on April 3, 2013. Approximately 72 BCM (94 BCY) of debris, soil, and rock were removed and disposed at ERDF. The maximum depth of the excavation was approximately 0.91 meters (3 ft) bgs.

The excavation at the 100-K-91 waste site was conducted on November 28, 2012. Approximately 0.2 BCM (0.26 BCY) of suspect asbestos, soil, and rock were removed and disposed at ERDF. The maximum depth of the excavation was approximately 1.2 meters (4 ft) bgs.

The excavation at the 100-K-92 waste site began on November 13, 2012, and concluded on December 13, 2012. Approximately 32 BCM (42 BCY) of debris, soil, and rock were removed and disposed at ERDF. The maximum depth of the excavation was approximately 0.6 meters (2 ft) bgs.

The excavation at the 100-K-95 waste site began on January 8, 2013, and concluded on June
24, 2013. Approximately, 4,272 BCM (5,588 BCY) of soil and rock were removed and disposed at ERDF. The maximum depth of the excavation at the 100-K-95 waste site was approximately 1.5 meters (5 ft) bgs.

**Names:**
100-K-96; 100KE River Effluent Pipeline; 100KE River Line; River Line (East) from 116-K-3 Outfall

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Start Date:** 4/14/2011

**End Date:**

**Description:** 100-K-96 is a 213 centimeters (84 inches) diameter, carbon steel river effluent pipelines that extends from the face of 116-K-3 outfall structure to the Columbia River. The 100-K-80 pipeline runs parallel to 100-K-96. The pipelines are approximately 122 centimeters (48 inches) apart. In January 2012, the river effluent pipeline designations were split. The portion of the 100-K-96 pipeline that extends into the river was given a new WIDS sitecode (100-K-114).

**Location:** The 100-K-96 river pipeline is located on the Columbia River shore, adjacent to the 100K Area. It is east of the adjacent, inactive 100-K-80 pipeline.

**Related Sites/Structures:** The pipeline site is associated with the 116-K-3 Outfall Structure, the 100-K-83 Spillway, the 100-K-47 process sewer, 100-K-56 process effluent lines, the 100-K-55 process effluent lines, the 100-K-60 process sewer, the 116-KW-3 Retention Basins, the 100-K-80 river pipelines, and the 100-K-114 pipeline segment.

**Process Description:** 105-KE reactor cooling water was collected and temporarily stored in the 107-KE Retention Basins. The cooling water was discharged to the river, bypassing (underneath) the 116-K-3 outfall structure, through the 100-K-96 river pipeline. Process sewer waste, from both 100-KE and 100-KW facilities, entered the outfall structure and dropped into the 100-KE river pipeline through large-diameter, vertical standpipes welded onto the river pipelines.

Retention basins lines (100-K-55 and 100-K-56) did not discharge through the outfall structure, but passed under it. They are continuous lines from each reactor that become the river effluent pipelines downstream of the outfall structure. The pipelines discharge into a recessed, sloped riprap river bed structure, measuring 9 meters (30 feet) wide by 12 meters (40 feet) long and 1 meter (3 feet) thick. The total drop from the face of the outfall structure to the discharge end of the pipelines is 18 meters (60 feet).

In 1955, the lines began to float and break. Both lines were damaged. To remedy the problem, a 2 to 3 meter (6 to 10 feet) thick riprap jetty was placed over the lines from the shoreline to a point approximately 320 meters (1050 feet) from the face of the outfall structure.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** The waste includes the pipeline and the contaminated scale contained within it. The effluent included both reactor cooling water and process sewer waste. The Contaminants of Potential Concern are based on the 116-K-3 outfall, and include Co-60, Cs-137, Eu-152, Eu-154, Pu-239/240, and Sr-90.

**Description:** The site consists of the soil beneath the removed structures of the 183.2-KW Sedimentation Basins and 183.3 KW Sand Filter Basins.  
**Location:** The site is located south of the 105-KW Reactor.

---

**Code:** 100-K-111  
**Names:** 100-K-111; Effluent Seepage Area from 116-K-2  
**Type:** Contamination Migration  
**Status:** Inactive  
**Description:** The site is an area along the Columbia River shoreline appears to have been impacted by effluent from the 116-K-2 trench. This suspicion is evidenced by surface features visible in historical photographs (e.g. 37465-10CN taken in 1964).  
**Location:** The site is 363 meters (1,191 ft) northeast of 116-KE-4 (107-KE Retention Basins).  
**Process Description:** The 116-K-2 trench received contaminated effluent from floor drains and the metal storage basin overflows in the 105-KE and 105-KW Reactors, as well as emergency discharges from the KE and KW Retention Basins. Until 105-KE and 105-KW shut down around February 1, 1970, an undetermined amount of Retention Basin effluent (believed to be up to 37,854 LPM (10,000 GPM)) leaked through 107 cm (42 in) butterfly valves in the tank bottoms. Other periodic flows included low volume, neutralized, dummy decontamination waste, process-cooling water during charge/discharge; occasional special disposals; and an occasional tank of process cooling water that was collected after a fuel cladding failure. In 1978, the radioactive inventory of the trench was calculated at 2,100 curies (UNI-946).

Prior to 1977, surface contamination extended several hundred feet along the river side of the unit. This surface contamination was covered with up to 1.2 m (4 ft) feet of soil and gravel during the summer of 1977, and posted with AC-5-40 concrete markers (DC-0023). The concrete post locations have been surveyed. The entire site was posted as underground radioactive material.

The K Area geology and hydrology were such that liquid discharges to the soil within the operating area routinely bled out the shore line as it sloped to the river. Also within this area is the leach trench that was installed to drain the cobble filled trench from waste site 116-K-1 to the river (DOE/RL-94-61).

In September 1996 contaminated soil was removed from the site. In 1997, a single test pit was excavated on the south side of 116-K-2 (approximate coordinates were N147260/E569400). Radiological surveys of the soil did not identify any contamination.

---

**Code:** 100-K-112  
**Names:** 100-K-112; Surface Contamination from Waste Storage Operations  
**Type:** Unplanned Release  
**Status:** Inactive  
**Description:** The site is a contamination migration site due to the 116-K-2 trench. The site is 363 meters (1,191 ft) northeast of 116-KE-4. The trench was associated with 116-KE-4 and 116-KW-3 Retention Basins via the 100-K-55 and 100-K-56 pipelines.  
**Location:** The surface liquids are northwest of the mile long trench (116-K-2). This trench was associated with 116-KE-4 and 116-KW-3 Retention Basins via the 100-K-55 and 100-K-56 pipelines.  

**Process Description:**

In September 1996 contaminated soil was removed from the site. In 1997, a single test pit was excavated on the south side of 116-K-2 (approximate coordinates were N147260/E569400). Radiological surveys of the soil did not identify any contamination.
Status: Inactive  
End Date: 

Description: The waste site has been evaluated and reclassified to Rejected. It had been a posted Contamination Area remaining after waste stored in this area was removed. The storage area had been approximately 12 by 6.7 meters (41 by 22 feet). Nothing was being stored within the boundaries of the storage area in 2007, when the contamination was identified. Six to twelve inches of soil was removed from inside the smaller Contamination Area in December 2011. The excavated area was also filled to grade with clean material and the posting was changed back to the 100-K Operational Area Underground Radioactive Material Area status.

Location: The waste site is located north of 105-KW, adjacent to the 100-K Area perimeter fence. It is north of Wakefield Loop.

Code: 100-K-113  
Classification: Accepted

Names: 100-K-113; 100KW Columbia River Effluent Pipeline; Portion of Effluent Piping Extending Beyond River Shore  
Reclassification: None

Type: Radioactive Process Sewer  
Start Date: 
End Date: 

Description: 100-K-113 is a 213 centimeters (84 inches) diameter, carbon steel river effluent pipelines that extends beyond the river shoreline, into the Columbia River. The 100-K-113 pipeline runs parallel to 100-K-114. The pipelines are approximately 122 centimeters (48 inches) apart. In January 2012, the river effluent pipeline designations were split. The portion of the 100-K-80 pipeline that extends into the river was given a new WIDS sitecode (100-K-113).

Both the 100-K-113 and 100-K-114 pipelines are exposed along most of the run, protruding 0.3 to 0.9 meters (1 to 3 feet) above the riverbed. They were originally covered by a minimum of 0.6 meter (2 feet) of soil over their entire length.

Location: The 100-K-113 river pipeline site is located in the Columbia River, adjacent to the 100K Area. It is west of the adjacent 100-K-114 pipeline.

Related Sites/Structures: This portion of pipeline is the in-river extension associated with the 100-K-80 pipeline.

Code: 100-K-114  
Classification: Accepted

Names: 100-K-114; 100KE Columbia River Effluent Pipeline; Portion of Effluent Piping Extending Beyond River Shore  
Reclassification: None

Type: Radioactive Process Sewer  
Start Date: 
End Date: 

Description: 100-K-114 is a 213 centimeters (84 inches) diameter, carbon steel river effluent pipelines that extends beyond the river shoreline, into the Columbia River. The 100-K-114 pipeline runs parallel to 100-K-113. The pipelines are approximately 122 centimeters (48 inches) apart. In January 2012, the river effluent pipeline designations were split. The portion of the 100-K-96 pipeline that extends into the river was given a new WIDS sitecode (100-K-114).

Both the 100-K-113 and 100-K-114 pipelines are exposed along most of the run, protruding 0.3 to 0.9 meters (1 to 3 feet) above the riverbed. They were originally covered by a minimum of
0.6 meter (2 feet) of soil over their entire length.

**Location:** The 100-K-114 river pipeline site is located in the Columbia River, adjacent to the 100K Area. It is east of the adjacent 100-K-113 pipeline.

**Related Sites/Structures:** This portion of pipeline is the in-river extension associated with the 100-K-96 pipeline.

**Classification:** Accepted  
**Names:** 100-K-115; 1717-K Potential Asbestos in Soil  
**Reclassification:** None  
**Type:** Dumping Area  
**Start Date:**  
**End Date:**  
**Status:** Inactive  
**Description:** The waste site is the potential asbestos containing material (ACM) left in place following the demolition of the 1717K building. 1717K was demolished in August 2011. The gravel covered area encompasses the footprint of the demolished structure. It is surrounded with concrete barriers and rope. Signs have been posted that say "Caution: Potential Asbestos Hazard; Transite in the Soil; No ground-intrusive or heavy equipment activities in this area unless specifically authorized by controlling project OS&H", due to a potential for encountering asbestos material remaining after the demolition of the structure. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

**Location:** The demolished building site is located near the corner of K Ave. and Wagner St.

End Date: None

Classification: Accepted

Reclassification: None

Description: The waste site is the potential asbestos containing material (ACM) left in place following the demolition of the 190-KE Pump House. The pump house was demolished in September 2011. The area is a large open excavation posted as Danger Fall hazards, Danger Demolition Area and Danger Asbestos. The area posted is much larger than the building foot print. The 190-KE basement floor and tunnel were left intact. The open 190-KE excavation is adjacent to the demolished 183.4KE clearwell excavation. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

Location: The 190-KE pump house was located on the north side of the 183.4-KE clearwell reservoir. It was attached to the south side of the 165-KE Power Control building.
### 100-K-129; 190-KW; 190KW Potential Asbestos in Soil

**Type:** Dumping Area  
**Status:** Inactive  
**Description:** The waste site is the potential asbestos containing material (ACM) left in place following the demolition of the 190-KW Pump House. The pump house was demolished in December 2011. The area is a large open excavation posted as Danger Fall hazards, Danger Demolition Area and Danger Asbestos. The area posted is much larger than the building footprint. The 190-KW basement floor and tunnel were left intact. The open 190-KW excavation is adjacent to the demolished 183.4KW clearwell excavation. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

**Location:** The 190-KW pump hose was located on the north side of the 183.4-KW clearwell reservoir. It was attached to the south side of the 165-KW Power Control building.

### 100-K-130; 181KE; 181-KE Pump House

**Type:** Dumping Area  
**Status:** Inactive  
**Description:** The waste site is the potential asbestos containing material (ACM) left in place following the demolition of the 181-KE Pump House. The pump house was demolished in September 2011. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

**Location:** The 181-KE pump house had been located at the river shore, north of the 107KE and 107KW retention basins.

### 100-K-131; 1908KE; 1908-KE Water Monitoring Station Potential Asbestos in Soil

**Type:** Dumping Area  
**Status:** Inactive  
**Description:** The waste site is the potential asbestos containing material (ACM) left in place following the demolition of the 1908-KE water monitoring station building. The structure was demolished in January 2011. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

**Location:** The 1908-KE water monitoring station had been located south of Winlock Street, west of the 107KE basins.

Hanford Site Waste Management Units Report
February 2015
Location: The site is located at the west end of the 105-KE/105-KW exclusion area fence.

Related Sites/Structures: The 105-KW Fuel Storage Basin is a separate site because of past leakage. It is site 100-K-43.

Waste Type: Vegetation

Waste Description: This unit contains an estimated 51,000 curies of radionuclides, 1.41E+05 kilograms (155 tons) of lead, and 708 cubic meters (25,000 cubic feet) of asbestos.

Code: 100-N-66

Classification: Accepted

Reclassification: None

Names: 100-N-66; 105-N/109-N Reactor Building Complex

Type: Reactor

Start Date: 1/1/1963

End Date: 1/1/1987

Description: The waste site is the 105-N Reactor Building and the 109-N Heat Exchange Building, which shared a common wall. The demolition of the ancillary portions of the 109-N and 105-N buildings began in the spring of 2007 and continued through September 2012. The objective of the demolition activities was to make necessary modifications to the structures to construct the Interim Safe Storage (ISS) Safe Storage Enclosure (SSE) for the 105-N reactor core. The removal of above and below grade structures, up to the SSE boundary, was completed in November 2011. More than one hundred thousand tons of material was shipped to the ERDF facility. A steel roof was placed on the remaining, reactor core enclosure. Excavation areas were radiologically surveyed and backfilled.

In late August 2009, as below-grade demolition was nearing completion, a visual inspection of the excavation identified that cold joint material had fallen to ground from the outside walls of the Safe Storage Enclosure (SSE). The black material was sampled and the analysis indicated the mastic portion contained between 20% and 30% asbestos.

The 2013 Facility Status Change Form for the 105-N/109-N Buildings (D4-100N-0046) document discusses several items identified where contamination and asbestos was found outside the south and east sides of 105-N/109-N that was left in place. Items left in place include: Mastic containing asbestos stuck to the outside of the 109-N Building's southern and eastern below-grade Safe Storage Enclosure walls; Two areas where short sections of contaminated pipe remain embedded in a below-grade outer foundation on the east side of the 109-N Building; Radiological contamination fixed to the outer Safe Storage Enclosure wall below grade on the east side of the 105-N Building; Radiological contamination in soil underneath the former 105-N Zone 1 Supply Plenum; An anomaly left in the soil below grade on the west side of the 105-N Building.; Radiological contamination fixed to below grade structures on the west side of the 105-N Building and Radiological contamination left in the soil below portions of the 105-N Building.

Shutdown of the N Reactor was ordered in October 1991. N-Reactor Deactivation activities occurred from 1995 through 1998. Operational systems were isolated and hazardous and radiological wastes were removed from 83 facilities at the N Reactor Complex. Over 80,000 cubic feet of solid wastes and 1.7 million gallons of liquid waste were removed during that activity. The 105-N Fuel Storage Basin was cleaned and stabilized. Empty fuel canisters were retrieved and removed. High pressure washing of the basin was required to reduce dose rates and contain airborne contamination hazards. Basin sediments were characterized and removed to the ERDF facility. The fuel storage basin water was removed and transferred to the 200 Area Effluent Treatment Facility and Liquid Effluent Retention Facility.
Final decommissioning and decontamination of the ancillary facilities began in 2007 and was nearly complete in 2008 when demolition activities commenced to remove the southern and eastern portions of the 109-N Building outside the steam generator cells. The removal of these areas, and the areas outside of shield walls surrounding the reactor proceeded in a general counterclockwise pattern around 105-N/109-N until September 2012. Twenty-three WIDS waste sites were within or adjacent to the facility footprint. Nine were completely removed and fourteen were partially removed. The demolition at 105-N/109-N included removing and properly disposing flammable and hazardous material (e.g., oils, grease, asbestos-containing material, mercury, lead and polychlorinated biphenyls [PCBs]). During demolition activities, the construction of a Safe Storage Enclosure roof was coordinated. Excavations left from demolition activities were visually inspected for stains and anomalies and surveyed for radiological contamination prior to backfill. Above and below-grade penetrations into the Safe Storage Enclosure were sealed to prevent animal and insect intrusion, and water in-leakage. Most of the material used to backfill was obtained from the nearby 100-N borrow pit.

On September 19, 2012, a concrete wall (pour back) that had been constructed over the former Fuel Storage Basin's fast cart tunnel was sealed. Sealing this pour back signified completion of the SSE and the Tri-Party Agreement (TPA) Milestone M-093-020.

The 105-NA and 1722-N buildings were demolished in August 2010. A portion of 100-N-66 (105-N) was removed by this activity. Following demolition and removal 105-NA and 1722-N, considerable cleanup of the 105-N Reactor building occurred within, and around the footprints of these buildings. The subsequent excavation removed much, if not all, of the radiological contamination directly associated with them. However there is a potential for the soil beneath them to be contaminated. Therefore, the footprints of the 105-NA and 1722-N buildings will be considered part of 100-N-66.

The above-grade and below-grade portions of the 105-NE Fission Products Trap were demolished and excavated between November 2011 and April 2012. Residual radiological contamination was detected during post-demolition GPERS surveys performed at the footprint of the 105-NE Fission Products Trap. This contamination was deferred to the 100-N-66 site.

Demolition of the 117N Exhaust Air Filter House and the 117-NVH Valve Control House was completed in 2011. The southern-most portion of the 117N facility consists of the tunnels between 117N and the 105N/109N facilities. The southern portions include the footprint beneath the former tunnels between 117N facility and 105N/109N facilities were greater than 1.5 X background. The contamination that remains in the footprint of these tunnels will be addressed as part of 100-N-66. The 117N building and the northern portion of the tunnel footprint were not radiologically contaminated and do not require further dispositioning. These portions were not deferred to 100-N-66.

Location:
The 105-N and 109-N buildings are located in the center of the 100-N Area of the Hanford Site.

Related Sites/Structures:
Structures associated with the 105-N Reactor Building are the 1312-N liquid retention facility, 1734-N Building, the 117-N Filter Building and a stack used for discharge of reactor ventilation air, chemical waste storage tank for decontamination solutions and the 1301-N and 1325-N cribs and tile fields. Structures associated with the 109-N Building are the dump tank for emergency discharge of primary coolant located on the west side of the building, sealwell and outfall system to return condenser cooling and condensate water to the Columbia River. UPR-100-N-35 has been consolidated with Reactor facility (100-N-66).

Process Description:
The 105-N Reactor is a graphite-moderated, light-water cooled, horizontal-pressure-tube nuclear reactor. The reactor piping was designed for 13,000 kilopascals (1,825 pounds per square inch) and 320 degrees Celsius (600 degrees Fahrenheit) maximum operating conditions. Normal operating parameters were 11,000 kilopascals (1,600 pounds per square inch) and
approximately 290 degrees Celsius (550 degrees Fahrenheit). The reactor coolant circulating pumps are single-stage, horizontal, centrifugal pumps with high pressure water injection seals to prevent reactor coolant loss. As in the other reactor buildings a zoned ventilation system is provided so that air flow is maintained in the direction of areas having the greatest potential risk of contamination. The control room has its own refrigerated air conditioning system. The 105-N Reactor Building is 137.77 meters (452 feet) by 78.94 meters (259 feet) with a stepped roof to 21.34 meters (70 feet). Additionally, a 55.78 meters (183 feet) by 21.34 meters (70 feet) basin and transfer area extend west at the southwest corner. The breakdown of the facility is 29 offices: 467.29 square meters (5,030 square feet); 4 shops: 1,009.82 square meters (10,870 square feet); storage: 295.42 square meters (3,180 square feet); common: 467.29 square meters (5,030 square feet); process, operating and fuel storage: 13,006 square meters (1.4E+05 square feet).

The 109-N Building contained a large pipe gallery on the north side which receives the primary reactor coolant system piping from the reactor for distribution into five separate cells each housing two large heat exchangers, a primary circulating pump and associated piping. A sixth cell contained a heat exchanger system for the moderator cooling system. The pipe gallery and steam generator cells were located in a reinforced concrete enclosure which defined a confinement zone. Located outside of the confinement zone were the pump drive systems, dump condensers for disposal of export steam, condensate return pumps, other auxiliary equipment, a small chemical laboratory, and water sampling and monitoring facilities. A Service Bay had facilities for decontaminating the primary coolant system and contains the heating and ventilation equipment, shop areas, office and common space. The 109-N Building was 62.79 meters (206 feet) by 116.74 meters (383 feet) by 11.89 meters (39 feet) high. The facility included 3 offices: 75.25 square meters (810 square feet); 2 shops: 197.88 square meters (2,130 square feet); common: 111.48 square meters (1,200 square feet); processing area: 11,148 square meters (1.23E+05 square feet).

For special nuclear material production (no steam generation to the Hanford Generating Plant [HGP]), steam from the secondary side of ten steam generators was routed through 16 river water-cooled dump condensers. Condensate from the dump condensers was routed back to steam generators for regeneration. For dual-purpose operation, byproduct steam from the steam generators was supplied to the HGP to produce 860 megawatts (electrical). For either single- or dual-purpose operation, there were 12 steam generators. Ten of the steam generators were used during five-cell operation and eight for four-cell operation. During dual-purpose operation, most of the steam produced was available for use by HGP to generate electricity, with some reserved to power the reactor coolant system pump drive turbines and the in-plant turbine generator.

The N Reactor used a confinement system based on the concept to release the initial burst of steam resulting from a postulated reactor coolant pipe break. When the confinement pressure subsided, the steam vents were closed and ventilation valves opened. The ventilated steam was filtered through charcoal and high efficiency filters to prevent any release of fission products from fuel failure. The 1312-N Liquid Effluent Retention Facility (LERF) was constructed as part of the safety enhancement program initiated in 1987. This facility served as a backup to the existing containment system and was designed to receive primary cooling water in the event of an emergency, such as fuel failure. The LERF facility consists of a high-density polyethylene bladder contained within a lined berm impoundment. The LERF was never used. The portion of the reactor coolant system within the N Reactor building consists of 16 parallel lines that conducted cooling water from an inlet water manifold in the 109-N Heat Exchanger Building to the reactor. Each of these 16 lines terminates in a vertical header to which is attached 54 to 66 individual pressure tube header-to-inlet nozzle connectors. Similar outlet risers and parallel lines conducted the coolant from the pressure tube outlet nozzle-to-header connectors to an outlet water manifold. In the 109-N Heat Exchanger Building, which is immediately adjacent to the N Reactor building, the reactor coolant system consisted of six cells in parallel, each
containing two steam generators (in parallel), a circulating pump and associated valves and instrumentation. Piping and steam generators in each of the six cells could be isolated from the main header piping by means of isolation valves.

Reactor coolant pressure and temperature were controlled to prevent boiling at any point in the system. A surge vessel (pressurizer) controlled system pressure and volume surges resulting from normal coolant density changes during reactor transient heat output conditions. The pressurizer consists of a cylindrical pressure vessel with a useful volume of about 34 cubic meters (1,200 cubic feet) and was connected directly to the reactor outlet piping. Two electric immersion heater systems maintained the pressurizer at saturation temperature and pressure retaining approximately 40% useful surge volume during normal operations. During outsurges of water from the pressurizer, the drop in pressure was compensated for by flashing steam from the saturated water. Increases in system pressure were limited by injecting a water spray into the steam space to condense some of the steam. This spray was reactor coolant fed from either reactor inlet water or from the high pressure injection pumps.

The secondary steam system for the N Reactor removed the reactor heat from the reactor coolant system by boiling secondary water in the shell side of the steam generator. During operation solely for the production of special nuclear material the major fraction of this steam was routed to 16 dump condensers which were arranged in parallel and cooled by untreated Columbia River water. These condensers operated at a pressure near that of the steam generators and eliminated the need for steam pressure reducing stations. Condensate was pumped from the dump condensers back to the steam generators for recycling. To achieve maximum single purpose productions operation, the steam temperature and pressures were maintained as low as practicable. A portion of the steam generated was utilized by the coolant pump drive turbines and by the turbine generator for local station service. During dual purpose operation, the major fraction of steam generated was routed to the HGP. A portion of the steam generated was used to drive the reactor coolant pumps, the onsite turbine generator and to keep the dump condensers warm so they were ready to accept full steam load in the event of an HGP turbine generator shutdown. Strained untreated water from the Columbia River was supplied as coolant to the dump condensers as well as the reactor coolant pump drive turbine surface condensers and the local turbine generator condensers. This condenser cooling water was then returned to the river.

The fuel used for operation of the N Reactor was slightly enriched uranium-235 (0.94% to 1.25%), clad with a zirconium alloy. At shutdown, a concentric tube-in-tube fuel design was in use. In the past, other materials have been used as a target in connection with an enriched uranium driver fuel element to produce useable isotopes such as tritium and plutonium-238. The fuel cladding is zircaloy-2 metallurgically bonded to the uranium by a co-extrusion process. The fuel elements used in N Reactor were manufactured by United Nuclear Corporation and ranged from 38 to 66 centimeters (15 to 26 inches) in length.

**Waste Type:** Water

**Waste Description:** The waste is the 105-N/109-N Building complex, including the reactor core. The 105-N and 109-N Building complex is radioactively contaminated or potentially contaminated within all confinement zones, irradiated fuel storage areas, primary and secondary coolant piping systems, and confinement ventilation systems. During demolition approximately 82,107 square feet of asbestos containing material was removed. Thirty two tons of lead was treated and disposed in ERDF along with numerous mercury containing switches, manometers and instruments.

**Code:** 100-N-79  
**Names:** 100-N-79; 1908 N Outfall Structure; 1908-N Spillway; 100-N-77:1 Flume  
**Classification:** Accepted  
**Reclassification:** Interim Closed Out (2/12/2014)
Type: Outfall
Status: Inactive

Description: The waste site has been remediating and Interim Closed Out. It consisted of a reinforced concrete spillway (also referred to as an emergency outfall). The spillway extended from the former 1908-N outfall under a service road, dropping approximately 14.6 meters (48 ft) before discharging at the river shore approximately 112 meters (367 ft) from the outfall. The portion of the spillway that passed below the service road was a four-sided closed concrete plume. Below the service road, the spillway was a 3.7 meters (12 ft) wide concrete flume with 0.3 meters (1 ft) thick walls and floor and wall height that varied from 1.5 meters (5 ft) to 2.1 meters (7 ft).

Location: The site was located west of the 109-N Building and the 1300-N Emergency Dump Basin, and south of the 1301-N Emergency Dump tank, on a steep bank which led to the river.

Process Description: The spillway was an emergency discharge point for the 1908-N Outfall structure. It was planned to be used only if the 100-N-77 river effluent pipelines were blocked, damaged, or undergoing maintenance. There is no corroborated physical or historical evidence that the spillway was ever used. The spillway served as an alternate discharge point for the 1908-N outfall, receiving raw river water used to cool the secondary coolant loop for the 105-N Reactor.

Waste Type: Chemicals

Waste Description: There is anecdotal evidence that the spillway was never intended or expected to be used, as it was never permitted. An unknown level of radioactive contamination exists within the structure because the discharge lines were associated with the reactor's secondary steam system.

Closure Info: The upper portion of the 100-N-79 spillway was removed during remediation of the 100-N-57 (Emergency Dump Tank) waste site in 2011. The 1908-N Outfall structure was removed in 2012. Remediation of the remaining portion of the spillway was initiated on March 4, 2013, and was completed on August 29, 2013. Approximately 1,265 bulk cubic meters of material was removed and direct loaded for disposal at the Environmental Restoration Disposal Facility (ERDF). The portion of the concrete spillway remaining below the OHWM was left in place and a sample of the concrete exposed just above the water at the OHWM was collected for informational purposes. No radiological contamination was reported.

Because the 100-N-79 spillway extended into the Columbia River, the ordinary high water mark (OHWM), at an elevation of 120.4 meters (395 ft) above mean sea level (amsl), was used to determine the lower extent of remediation of the waste site.

Following remediation, the radiological postings were removed - per WCH Internal Memos (CCN 176583 and 175935).
**Location:**
The 100-N-104 spillway was located 119 meters (390 ft) downstream of the Hanford Generating Plant River Pumphouse (181-NE) at coordinates E570939.9 N149367.9.

**Related Sites/Structures:**

**Process Description:**
The system was designed to collect in a 91 cm (36 in) line (100-N-61:1), the overflow and drainage from four water storage tanks and dispose the waste water to the river. The four, above ground water storage tanks (1900-N) were an stored tank heat removal process water. An emergency raw water storage tank, a filtered water storage tank and a demineralized water storage tank were also part of this system. The system is comprised of an overflow and a drain piping from each of the water storage tanks, and a 30.5 cm (12 in) raw water return line (100-N-61) from the 182-N Building. The effluent from the 91 cm (36 in) line spills into a sloped concrete chute, into the stilling basin and thence to the river (HW-69000 Volume II, Page 8.2.6-2). The afterheat removal system storage tank was designed as a reservoir of demineralized water for makeup to the secondary loop for normal operation and for flooding of the secondary loop in the water-to-water operation. It also served as storage for water spilled for level control of the secondary loop, water not needed in the secondary loop after the water-to-water operation, and condensate returns from various plant heaters (HW-69000 Volume II, Page 3.1.3-2).

The emergency raw water storage tank was designed as a reservoir of tempered raw water for reactor emergency once-through cooling (HW-69000 Volume II, Page 1.2.3-2). The a filtered water storage tank was designed for storage of filtered water pumped to it from the 183-N Building (HW-69000 Volume II, Page 2.1.5-2). The demineralized water storage tank was designed as a reservoir of effluent water from the demineralizer plant, and as the normal supply to the high and low pressure injection pumps. It was served as an emergency supply to the pumps of the afterheat removal fill system, the fog spray and fire protection pumping systems, the high lift emergency raw water pumping system, and the emergency raw water storage tank (HW-69000 Volume II, Page 3.1.1-2).

**Closure Info:**
Remedial action at the 100-N-104 waste site was conducted from March 10 through 12, 2014. The waste from the site included residual concrete, soil, rebar, and steel plating. Approximately 445 bank cubic meters (BCM) (582 bank cubic yards [BCY]) of waste was removed and directly loaded for disposal at the Environmental Restoration Disposal Facility. Of the waste volume, approximately 100 BCM (131 BCY) was nonsoil (e.g., concrete, rebar, and steel plating). The excavation extended to approximately 2.0 meters (6.5 ft) below ground surface. No anomalies were discovered during remediation.

The lower section of the spillway (downslope from the river road) is below the ordinary high water mark (OHWM). Per agreement with Ecology, the section of the spillway that is below the OHWM was left in place.

**Description:** The site consists of multiple SPOR [Shallow Petroleum-Only Releases] areas of subsurface oil contaminated soil in the 100-N Area. 100-N-106 addresses unanticipated discoveries of shallow petroleum contamination at 100-N. The initial list of identified SPOR areas are associated with remedial activities at waste sites includes 100-N-25, 100-N-61:1, 100-N-61:2, 100-N-62, 100-N-63:2, 100-N-64:1, 100-N-64:2, 116-N-2, 120-N-3, UPR-100-N-14. Soil stains and/or elevated TPH or petroleum-derived Poly-aromatic Hydrocarbons (PAH) concentrations were identified during remedial activities, but petroleum contamination was not listed as a constituent of concern (COC) or a constituent of potential concern (COPC) for these waste sites. It was anticipated that additional discoveries of petroleum contamination could be added to this waste site as remediation projects in the 100-N Area continued.

**Location:** The waste site (SPOR areas) are at locations multiple throughout the 100-N Area.

**Related Sites/Structures:** The oil contaminated soil areas are associated with remedial activities at waste sites 100-N-25, 100-N-61:1, 100-N-61:2, 100-N-62, 100-N-63:2, 100-N-64:1, 100-N-64:2, 116-N-2, 120-N-3, 100-N-84:2, UPR-100-N-14 and UPR-100-N-17.

**Process Description:** Elevated TPH or petroleum-derived PAH concentrations were identified during remedial activities, but petroleum contamination was not listed as a constituent of concern (COC) or a constituent of potential concern (COPC) for these waste sites. The source and occurrence of the releases is unknown.

| Related Sites/Structures: | The 244-A LS is associated with the 241-ER-153 diversion box, the 244-A DCRT, lines SN-232, SN-233, SN-234 and the 241-A valve pits. Per drawing H-2-38203, structures related to the 244-A Lift Station also include the exhaust fan and stack, instrument enclosure, caisson, flush pit, service pit, vacuum pump pad and transfer piping. The lift station is also associated with UPR-200-E-70, UPR-200-E-100, UPR-200-E-143, 200-E-144-PL, 200-E-145-PL, 200-E-
The 244-A LS provides lag storage for waste transferred from the 241-ER-153 diversion box, via lines SN-232, SN-233 and SN-234. The waste was then sent to the 241-A valve pit.

Waste Type: Steam Condensate

Waste Description: The 244-A Double-Containment Receiver Tank is located at the 244-A Lift Station and provides lag storage for waste transferred from the 241-ER-153 diversion box to the 241-A valve pits. Waste routed through the lift station includes 200 West Area waste; 241-B, 241-BX, 241-BY, and 241-C Single-Shell Tank waste; and waste transferred from B Plant. Waste transferred out of the 244-A lift station can be routed to any of the 200 East Area Double-Shell Tanks.

This Site has the Following SubSites:

- **Code**: 244-A LS:1
  - **Names**: 244-A LS:1; Lift Station
  - **Type**: Control Structure
  - **Status**: Inactive
  - **Description**: Subsite 1 is the Lift Station that includes the 244-A receiver tank and the pump pit.

- **Code**: 244-A LS:2
  - **Names**: 244-A LS:2; Transfer Piping
  - **Type**: Control Structure
  - **Status**: Inactive
  - **Description**: Subsite 2 is the transfer piping between the 241-ER-153 Diversion Box and the 244-A Lift Station (lines SN-232, SN-233 and SN-234). The total length of the pipeline segments is 55 meters, calculated with the Geospatial data in ArcGIS.

The SubSite is Part Of:

- **Code**: 244-A LS
  - **Names**: 244-A LS; 244-AR Lift Station; 244-AR LS; SN-232, SN-233 and SN-234; 244-A Lift Station

- **Code**: 241-AR-151
  - **Names**: 241-AR-151; 241-AR-151 Diversion Box
  - **Type**: Diversion Box
  - **Status**: Accepted
  - **Description**: None
  - **Start Date**: 1/1/1976
The 241-AR-151 diversion box is a reinforced concrete structure. The walls and floor of the diversion box are lined with 11-gage stainless steel. The box drains to the 244-AR Vault and is equipped with a leak detector that alarms inside 242-A evaporator building. The structure is covered with a weather protective cover.

The diversion box is located north of the 244-AR Vault facility, east of 291-AR. It is on the west side of Buffalo Ave.

This unit is associated with 241-AY and -AZ tank farms and the 244-AR Vault. A pipeline associated with this diversion box is 200-E-206-PL. The drain line is V717.

The unit is utilized for the transfer of liquid mixed waste generated at PUREX to the AY and AZ Tank Farms. The 241-AR-151 was one of two diversion boxes used to transfer high level waste generated at PUREX to aging waste tanks in the 241-AY and 241-AZ Tank Farms. The diversion box is constructed of steel reinforced concrete. The walls and floor of the diversion box are lined with 11-gage stainless steel. The diversion box drains to the 244-AR Vault and is equipped with a leak detector that alarms in the 242-A Evaporator building. The diversion box was constructed in 1976 and was in service through approximately mid-2003, when 6 connecting pipelines were flushed, isolated and process blanks installed. The 241-AR-151 Diversion Box was weather sealed in September 2003. The diversion box was officially removed from service in June 2005 per Milestone Report M-48-07.

The diversion box is used to transfer waste from the 241-AY and 241-AZ Tank Farms. This waste includes aging waste, high-level B Plant waste, B Plant cesium feed waste, non-complexed, concentrated complexed and cesium and strontium recovery waste.

The 244-AR Vault facilities include a canyon building, a service building, two (filter building) concrete housings, and a change room. The canyon building is a reinforced concrete, two level, multi-cell structure. The lower process cells contain four tanks, a failed equipment cell and associated piping and equipment. The upper portion of the vault and the lower cells are separated by cover blocks with recessed lifting bails. The facility is posted with multiple radiological postings on the exterior of the building doors. They include Internally Contaminated Systems, Radiation Area, Underground Radioactive Material Area, Radiological Buffer Area, Radioactive Material Area, Contamination Area, High Contamination Area, and Fixed Contamination Area.

The building is located west of the 241-A Tank Farm, at the corner of 4th Street and Buffalo Ave.

The facility includes a crane, control room, two ventilation systems, a sluicing system (no longer in use), and a solution piping system.

The unit received waste sluiced from the 241-A and -AX Tank Farms. Processing took place, then the waste was shipped to B Plant. The facility was the focal point for reprocessing and routing of PUREX-generated waste between tank farms and B Plant (via 244-CR vault) in the late 1960's and between the tank farms and the Waste Encapsulation Storage Facility in the late
1970's. In 1984, a decision was made to upgrade the 244-AR vault for use as a waste transfer facility. The extensive upgrading effort provided improved features for the safe and efficient transferring of PUREX-generated waste between the tank farms and B Plant. The waste consisted of cladding removal waste enroute to B Plant and transuranic waste from B Plant/Waste Encapsulation Storage Facility to the tank farms. (reference ARH-374)

Waste Type: Soil

Waste Description: The 244-AR Vault was originally used to process radioactive waste that was being removed ("sluiced") from storage tanks. The waste was eventually transferred to the B Plant for removal of cesium and strontium. All of the liquid waste in the facility was transferred to 241-AY-102 in 2003. The vault was interim stabilized in 2003. There is an estimated 660 gallons of sludge and up to 194 gallons of liquid in the tank (RPP-12051, 244-AR Vault Interim Stabilization Completion Report, Page 3-2) Tank-001 cell 1. The tank is thought to be dry, but there may be up to 2 gallons of waste in the sump (RPP-12051). In Tank-002 Cell 2, there is an estimated 2080 gallons of sludge and up to 194 gallons of liquid in the tank (RPP-12051 page 3-3). The cell is thought to be dry, but there may be up to 2 gallons of waste in the sump (RPP-12051).

</table>
**Receiver Tank**

- **Type:** Receiver Tank
- **Status:** Active
- **Start Date:** 1/1/2005

**Description:** The site is an above ground tank. It is posted with Radiation Area and Contamination Area signs.

**Location:** The site is located west of the 241-AZ Tank Farm fence, adjacent to the 241-AZ-702 Ventilation Building.

**Related Sites/Structures:** The site is associated with the 241-AZ-702 Aging Waste ventilation system.

**Process Description:** The 241-AZ-301 receiver vessel was built to replace the 241-AZ-151 catch tank. The vessel receives condensate from the 241-AZ-702 Aging Waste ventilation system, which is the primary filter building for the 241-AY and 241-AZ tank farms.

**Waste Type:** Water

In 2013 a waste characterization determined the waste was non dangerous.

---

**201-C**

- **Classification:** Accepted
- **Reclassification:** None
- **Start Date:** 1/1/1949
- **End Date:** 1/1/1967

**Description:** Demolition activities removed the aboveground features of 201-C from 1983 through 1986. The below grade features and remains of the 201-C facility was entombed in concrete and has been covered with ash material. It is posted with Underground Radioactive Material signs. The current configuration of the building includes the lower 3 meters (10 feet) of the building filled with grout and partially covered with 3 meters (10 feet) of ash. The 201-C Process Building consisted of three integrated cells, seven process galleries, an exhaust system, a hot shop, and an air treatment room. Two additional cells were connected to the east side of the building. The process cells are primarily constructed of reinforced concrete.

**Location:** The building is located east of the 209-E Critical Mass Laboratory. It is currently located inside an area that has been surface stabilized with flyash and is posted with Underground Radioactive Material signs (see sitecode 200-E-41).

**Related Sites/Structures:** The structures associated with this building include process cells, equipment, piping, and ancillary structures. It is associated with the 216-C-1, 216-C-3, 216-C-4 and 216-C-5 cribs, 216-C-9 excavation and the 200-E-41 stabilized area.

**Process Description:** The 201-C Processing Building was the main processing facility for the Hot Semiworks Area. It was originally built in 1949 as a pilot plant for the Reduction Oxidation (REDOX) process. In 1954, the building was used as a pilot plant for the Plutonium Uranium Extraction (PUREX) process. The plant was converted to recover strontium from process wastes in 1961.

**Waste Type:** Process Effluent

The building was entombed in concrete in 1986. The building remnants contain radioactive and chemically contaminated structures, piping, and equipment. There is also a large quantity of lead shielding associated with the hot cells. All shielding was left in place. The entombed building inventory was estimated in 1989 to contain 4.9 curies of plutonium 239, 3.7 curies of plutonium 238, 0.2 curies of Americium 241, 9000 curies of strontium 90 and 2.5 tons of lead.
Waste Type: Process Effluent

Waste Description: There is residual chemical and radiological contamination present in the structure. According to DOE/RL-92-18 Revision 0, the radiological inventory is estimated to include: 68.3 curies of plutonium, 9,000 curies of strontium, and 0.2 curies of americium. Chemical wastes in the structure include solvents, acids and other process chemicals.

Names: 291-C; 291-C Fan and Filter Building; 291-C Filter/Fan House; 201-C Air Tunnel

Type: Process Unit/Plant

Status: Inactive

Start Date: 1/1/1949

End Date: 1/1/1987

Description: This building was demolished prior to the 291-C-1 Stack demolition in 1988. The unit consisted of an air tunnel from the 201-C Cells, fiber glass filters, high-efficiency particulate air (HEPA) filters, and the Fan House. The Fan House and HEPA Filter 2 were located above ground. HEPA Filter 1 and the concrete air tunnel were constructed below grade. The air tunnel connected the 201-C Building with the 291-C-1 Stack. The first 31 meters (100 feet) of the tunnel are 6 meters (20 feet) below grade. The second 31 meters (100 feet) of the tunnel are 1.5 meters (5 feet) below grade. There were forty removable aluminum cartridge glass fiber filters and an array of HEPA filters. The fan house building was a wood frame structure on a concrete slab. It contained two electric fans and one steam turbine fan.

Location: The 291-C Fan House building was located east of the 291-C Stack base, south of 7th Street.

Related Sites/Structures: The building was associated with the 291-C Exhaust Stack. Also see pipeline sitecodes 200-E-251-PL and 200-E-252-PL that drained these structures to the 216-C-2 reverse well.

Process Description: The structure provided exhaust air ventilation for the operating cells and process vessel vents of the 201-C Facility.

Waste Type: Process Effluent

Names: 200-E-27; 242-AC; 242AC Pipefitter Shop Lead Cutting Area

Type: Dumping Area

Status: Inactive

Start Date: 

End Date: 

Description: The 242AC Pipefitter Shop had a lead cutting area and an area used to store lead sheets and pipe for use on various construction projects. The area is no longer used for lead cutting, but is used by the shop as an equipment and material storage area. The lead cutting area has sandy soil and contains pieces of lead. The area surrounding the lead cutting area is covered with crushed rock. Tank farm equipment, lead material covers, and a heavy duty table are currently stored in the lead cutting area. The entire 242AC Pipefitter Shop area is surrounded by a chain-link...
The site is located at the corner of 4th Street and Buffalo Avenue. The Lead Cutting Area is on the east side of the 242 AC pipefitter shop.

Lead was cut at the facility using piano wire, a cutting torch, and a skil saw with the blade turned backwards. The skil saw created the small lead particles.

The site is associated with the 242-AC Pipefitter Shop.

Steam Condensate Soil at the site is contaminated with lead.

It consists of a reinforced concrete structure filled with sand and gravel and a roof of pre cast concrete slabs supported by the walls and concrete beams. The unit is partially below grade. The unit measures 33.5 meters (110 feet) by 15.25 meters (50 feet) by 4.8 meters (16 feet) high. It is posted with appropriate radiological signs.

The sand filter is located southeast of the 221-B canyon building, adjacent to the 291-B Stack.

The sand filter was used to filter the 291-B stack air. The sand filter is a partially buried concrete structure measuring 33.5 X 15.25 X 4.8 meters (110 X 50 X 16 feet). The 1987 Hanford Site Waste Management Units Report site description states "This site consists of sixty french drains, each measuring 6 inches in diameter, 3 foot 5 inches long, filled with coarse gravel, placed 13 feet 7 inches below the top of the structure. There is a concrete structure 100 X 48 X 14 feet 7 inches high which contains concrete blocks arranged in rows to form lateral ducts, with drains spaced throughout, every 10 feet lengthwise - 8 feet widthwise, all covered with 9 feet of sand and gravel, then covered with concrete slabs. There is a 1 foot layer of gravel on the entire bottom, with a layer of sisalkraft paper underneath which surrounds the drains throughout the structure." The 200 Area Waste Site Handbook (RHO-CD-673) describes the facility (sand filter) as "Sixty, 6 inch diameter vitrified soil pipes inside an area measuring 100 X 48 feet. The 291-B sand filter inlet trenches drain to a french drain pipe extending into the ground at the north corner of the sand filter. Any moisture condensed from the canyon air on the filter bed will escape to the ground at this location. The amount and activity are both very low."

Steem Condensate

The B Plant canyon ventilation passed through the sand filter from 1948-1952, during the bismuth phosphate fuel processing activities. It was active again periodically through the years as an emergency back up for the HEPA Filters. It is currently in a standby mode. In 1994, a the radionuclide inventory was estimated to be 3000 ci of Strontium-90 and 2000 ci of Cesium-137.

**Description:**  
This site is a large area posted with chain and Underground Radioactive Material signs. An area within the posted boundaries has been covered with fly ash. The ash-covered area encompasses the decommissioned 201-C Building, the 291-C Stack Burial Trench and the 216-C-2 French Drain. Waste sites and facilities buried beneath the ash are not individually distinguishable.

**Location:**  
The site is located in 200 East Area, south of 7th Street. It is east of the 209-E security fence.

**Release Description:**  
Two waste line leaks have been documented in WIDS files 200-E-56 and 200-E-57.

**Related Sites/Structures:**  
The area is associated with the 201-C building, 241-CX-70, 241-CX-71, 241-CX-72, 241-C-154, 216-C-2 and WIDS site codes 200-E-56 and 200-E-57.

**Process Description:**  
The 201-C Processing Building was the main processing facility for the Hot Semiworks Area. It was originally built in 1949 as a pilot plant for the Reduction Oxidation (REDOX) process. In 1954, the building was used as a pilot plant for the Plutonium Uranium Extraction (PUREX) process. The plant was converted to recover strontium from process wastes in 1961.

**Waste Type:** Process Effluent

**Waste Description:** The area covered with clean backfill contained residual contamination from the operation of the Hot Semiworks facility.

**Description:**  
The Railroad Cut is approximately 240 meters (800 feet) of track extending from the tunnel door northward to the isolation area gate. Two large berms of soil were placed along both sides of the track within the fenced portion of the spur to provide radiation shielding. A turnout siding (Donkey Track) is also located within the fenced Railroad Cut. The railroad cut is posted as a Contamination Area.

**Location:**  
The PUREX Railroad Cut is located on the northeast corner of the 202-A building. A railroad spur extends from the PUREX main lead to the tunnel entrance door.

**Related Sites/Structures:**  
The site is associated with UPR-200-E-10, UPR-200-E-11, UPR-200-E-12, UPR-200-E-20 and UPR-200-E-33.

**Process Description:**  
The railroad cut provides access to the PUREX tunnel and also to the burial tunnels south of the PUREX facility (218-E-14 and 218-E-15).

**Waste Type:** Chemicals

**Waste Description:** The contamination in the soil and gravel in the railroad cut is from many years of contaminated equipment and waste being transported on rail cars into and out of the PUREX facility.
Code: 200-E-102
Names: 200-E-102; Contaminated Soil Trench
Type: Trench
Status: Inactive
Start Date: 1/1/1958
End Date: 1/1/1958
Description: The trench is inside the surface stabilized Underground Radioactive Material area south of PUREX that is known as WIDS Sitecode 200-E-103. The trench is not separately marked or posted.
Location: The site is located 20.7 meters (68 feet) south of the south boundary of 216-A-4 Crib. It is currently covered with clean gravel and cannot be visually identified.
Process Description: The trench was used to bury contaminated soil from an unplanned release (WIDS Site UPR-200-E-15). When the 216-A-4 Crib plugged in 1958, it caused the ground between the 216-A-4 crib and the 291-A Turbine House to flood. The contaminated soil was scraped up and placed into a slit trench near the south end of the crib. The trench was covered with 0.3 meters (one foot) of clean dirt.
Waste Type: Process Effluent
Waste Description: The waste is contaminated soil caused by the plugging of the 216-A-4 Crib. It resulted in a flood of contaminated water in the 291-A Turbine House floor drains. The turbine house floor was contaminated to 20 rads/hour at 25.4 centimeters (10 inches). An area of ground and blacktop outside the turbine house was contaminated up to 8 rads/hour. The 216-A-4 Crib received waste solution from the 216-A-2 Waste Collection Tank, the U-3 and U-4 Laboratory Waste Receiver Tanks (located in the acid storage vault), the dissolver off-gas scrubbers and the 241-A-151 Diversion Box Catch Tank. 216-A-4 Crib was intended to receive a maximum of [284 liters (75 gallons) per minute] low level radioactive liquid waste.

Code: 200-E-111-PL
Names: 200-E-111-PL; 3-38 Encasement; Encased Pipeline from 241-ER-151 Diversion Box and 221-B to 241-C Tank Farm and 244-AR Vault; Lines V108/V837/8618/8653/8901PAS, 809, 818, V836 and V834
Type: Encased Tank Farm Pipeline
Status: Inactive
Start Date: 
End Date: 
Description: The site is an underground piping encasement that contains three 7.5 centimeter (3 inch) diameter stainless steel waste transfer pipelines connecting 241-ER-151 and B Plant to 241-C and 244-AR Vault. Lines V108, 8618, 8653 run from the 241-ER-151 diversion box through a "Y," which branches to the 241-C Tank Farm and the 244-AR Vault. The section from the "Y" junction to 241-C farm contains lines V108, 8618 and 8653. The section from the "Y" junction to the 244-AR Vault contains two 7.5 centimeter (3 inch) pipelines numbered 809 and 818. There is a posted Contamination Area on top of the line at the Y Junction where the line branches to the 241-C Tank Farm and the 244-AR Vault.
Line V837 extends south from 221-B to join the encasement. Line V837 ties into line V108 inside the encasement.
Line 8653 was replaced with V836. Line 8653 line separated when the cone expansion was added to 200-E-111-PL. Line V836 extended from the 8653 stub to 241-ER-151. V836 is a direct buried (M9) stainless steel line that runs parallel to (but outside) the encased lines.

Line V834 (from B-Plant) connected within the cone expansion to the remaining line 8653 to the Y division. (See drawings H-2-34179 and H-2-43043).

The entire length of the pipeline is marked with steel fence posts and posted as an Underground Radioactive Materials area. The ground surface above the pipeline is bare in spots, other sections are vegetated with crested wheatgrass, tumbleweeds, and native grass species.

**Location:** The encased pipeline runs eastward from the 241-ER-151 Diversion Box, south of 7th Street, and branches off in two directions (forming a Y) at a point southeast of the 216-C-10 Crib. From the Y, it branches to the 241-CR-151 Diversion Box inside 241-C Tank Farm and to the 244-AR Vault.

**Related Sites/Structures:** The waste transfer encasement is connected to the 241-ER-151 Diversion Box, 241-ER-152 Diversion Box, 241-CR-151, 241-C Tank Farm and the 244-AR Vault.

**Process Description:** The underground, encased pipeline was used to transfer waste from 241-ER-151 and B Plant to the 241-C Tank Farm and the 244-AR Vault.

Line V837 is a single direct buried line that terminates at the 200-E-111 PL encasement. Line V837 ties into line V108 in the encasement.

**Waste Type:** Process Effluent

**Waste Description:** The pipeline transported liquid effluent from the 241-ER-151 Diversion Box to the tank farms. Some adjacent soil has been contaminated from pipeline leaks.

---

**Code:** 200-E-112-PL

**Classification:** Accepted

**Reclassification:** None

**Names:** 200-E-112-PL; 24-Inch VP Line; 2904-E-1; B Plant Process Sewer; Pipeline from B Plant to 207-B Retention Basin

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** The site is the 61 centimeter (24 inch) diameter, underground process sewer from B-Plant to the 207-B Retention Basin. The pipeline is also known as 2904-E-1. The pipelines are marked above ground with steel posts and marked as "Underground Radioactive Material/Pipeline". Access manholes are located at intervals along the length of pipelines. Vegetation over the pipelines consists of grass and tumbleweeds, with several areas of bare soil.

**Location:** The waste site is an underground vitrified clay pipelines connect B Plant and the 207-B Retention Basin. It extends eastward from the southeast corner of B-Plant, then turns northward, connecting to the west side of the 207-B Retention Basin.

**Release Description:** UPR-200-E-32 is associated with this pipeline.

**Related Sites/Structures:** The process sewers are associated with 221-B (B Plant) and the 207-B Retention Basin.

**Process Description:** B-Plant routinely discharged process effluent, containing small amounts of radioactivity, to the 207-B Retention Basin via an underground process sewer pipeline. The 2904-E-1 sewer line
extends eastward from the south side of 221-B and turns north to connect to the west side of the 207-B Retention Basin. On several occasions large, unplanned amounts of radioactive material were released to the underground sewer lines. The process sewers are 0.6 meters (24 inches) in diameter clay pipelines that include a cast iron pipe from the 221-B building to the first manhole of the process sewer. The remainder of the sewer pipelines are constructed of vitrified pipe.

**Waste Type:** Process Effluent

**Waste Description:** The process sewer pipelines transferred liquid process effluent and cooling water to the retention basin and the 216-B-2 ditches. The radioactivity levels were normally low and the water was discharged from the retention basin to ditches that connected to the 216-B-3 Pond. However, in 1963 and 1970, Unplanned Releases UPR-200-E-32 and UPR-200-E-138 released significant amounts of cerium-144 and strontium-90 to the process sewer pipelines.

| Type:    | Process Sewer       | Start Date:     |                           |
| Status:  | Inactive            | End Date:       |                           |

**Description:** The site is an underground 41 centimeter (16 inch) diameter carbon steel pipeline that extends from the PUREX Plant to a distribution box located on the west side of the 216-A-6 Crib and continues eastward to the 216-A-30 Crib. The pipeline is marked with steel fence posts, posted as "Underground Radioactive Material" (URM) and "Pipeline" over its entire length. The 216-A-42C Valve Box is located on the pipeline, inside a domed cover. It is surrounded by a broken, wood fence. A small area just west of the 216-A-42C Valve Box has been stabilized with cobbles and separately posted as URM. Most of the pipeline is free of vegetation except for tumbleweeds near the 216-A-30 Crib.

**Location:** The site extends in an easterly direction from the southeast end of the PUREX plant to the 216-A-6 and 216-A-30 Crib.
**Process Description:**
The pipeline transported steam condensate waste from the PUREX facility to the 216-A-30 Crib via Distribution Box 1. The effluent from this line had the capability of being sent to the 216-A-6 Crib or the 216-A-30 Crib. From 1961 to 1966 the 216-A-6 and 216-A-30 Crib operated in parallel. After the 216-A-6 Crib was abandoned in 1970, all the effluent in this pipeline was diverted to the 216-A-30 Crib. The distribution box was filled with concrete in 1995. The effluent was monitored for radionuclides with an in-line monitoring system. If concentrations exceeded the discharge limits, an alarm was sounded in the dispatcher's office, a verification sample was collected, and the stream automatically diverted to the 216-A-42 Retention Basin.

**Related Sites/Structures:**
The pipeline is associated with the PUREX facility, the 216-A-6 Crib, the 216-A-42 Retention Basin, 220A Sample Pit, UPR-200-E-19 and the 216-A-42C Valve Box.

**Waste Type:** Process Effluent

**Waste Description:** The waste is the pipeline and adjacent soil contaminated from pipeline leaks.

**Code:** 200-E-116-PL

**Classification:** Accepted

**Reclassification:** None

**Names:**
200-E-116-PL; Direct Buried Pipelines
V111/V210/V130, 8902; Pipelines from 241-B-154 Diversion Box to 241-C-151 and 241-C-152 Diversion Boxes

**Type:** Direct Buried Tank Farm Pipeline

**Start Date:**

**End Date:**

**Status:** Inactive

**Description:**
200-E-116-PL waste site consists of two inactive, parallel direct buried lines (V130 and 8902) that run eastward from the 241-B-154 Diversion Box to the 241-C-151 and 241-C-152 Diversion Boxes in the 241-C Tank Farm (drawing H-2-432). In 1962, Line V212 plugged 16 feet from where it exited the 241-B-154 Diversion Box. It was cut and capped. Line 8902 was rerouted and attached to where V212 had been cut. the site includes a segment of line 8902 that exits the 200-E-198-PL and continues to 241-C tank farm (H-2-939). The waste site also includes a drain line that connects to the 241-B-302 Diversion Box.

Vegetation over the pipeline has been crushed due to vehicle traffic. An area located just north of the 241-B-154 Diversion Box was posted as a High Contamination Area in September 2000, but was covered with a bio-barrier and gravel in February 2001. It is now a rectangular posted URM area over a portion of the pipeline. Another area of contamination was found on this pipeline in June 2001. This area was covered with gravel and posted as a URM in August 2001.

**Location:**
The site is located north of and runs parallel to 7th Street, between B Plant and the 241-C Tank Farm in 200 East Area.

**Release Description:** The DynCorp Integrated Soil, Vegetation and Animal Control group submitted a posted High Contamination Area site to WIDS as a Discovery Site. They have determined that the area was posted due to growing, contaminated vegetation on the underground pipeline. The contaminated rabbitbrush was surrounded with High Contamination postings. In September 2000, contamination levels inside the posted area ranged from 1200 to 50,000 counts per minute. This area was later covered with a biobarrier and gravel. In June 2001, another area of growing contaminated vegetation was found adjacent to the area recently stabilized.

Contamination levels on the vegetation ranged from 1000 to 50,000 counts per minute.

**Related Sites/Structures:** The waste site is associated with 200-E-198-PL, 241-B-154 Diversion Box, 241-B-302 catch tank, 241-C-151 Diversion Box, 241-C-152 Diversion Box, and 241-C Tank Farm. UPR-200-E-82 is also associated with this transfer line.
**Process Description:** The pipelines transported radioactive mixed waste solutions originating from B Plant to the 241-C Tank Farm. This is a direct buried pipeline, not encased in concrete.

**Waste Type:** Process Effluent

**Waste Description:** The pipeline transported process effluent from B Plant. Some adjacent soil has been contaminated from pipeline leaks.

**Code:** 200-E-118

**Classification:** Accepted

**Names:** 200-E-118; 216A271 Shack; 216-B-3 Diverter Station; Diverter Station #3; Main Diverter Structure #3

**Reclassification:** None

**Type:** Control Structure

**Status:** Inactive

**Start Date:** 1/1/1994

**End Date:**

**Description:** The site is a small building (shack) that is labeled Main Diverter Structure #3. Inside the shack, the floor is made of metal grating. Below grade pipes and valves are visible through the grate. A section of the floor is open to the pipes below, and has a radiation rope across the opening. The rope had been posted with an old Surface Contamination Area sign. There had been a posted Contamination Area around a portion of the outside of the shack. In April 2007, the contamination was backfilled with clean dirt and the area posting was changed to Underground Radioactive Material. Just outside of the posted Contamination Area is a valve, labeled 216-B-3-3 Diverter Valve. Two concrete manholes are present, one on each side of the diverter valve.

**Location:** The site is located east of the 200 East Area fence, near the head end of the 216-B-3-3 Ditch.

**Related Sites/Structures:** The site is associated with the underground pipelines to 216-B-3 ponds and 216-A-25 pond (see sitecodes 200-E-126-PL and 200-E-127-PL).

**Process Description:** Water from B Plant and PUREX could be diverted to the 216-B-3 Pond lobes or to Gable Mountain Pond (216-A-25) via valves in the diverter station. Gable Pond became inactive in 1984 and was backfilled. The 216-B-3-3 Ditch was active until 1994.

**Waste Type:** Process Effluent

**Waste Description:** The site is an abandoned shed posted with Contamination Area signs.

**Code:** 200-E-126-PL-B

**Classification:** Accepted

**Names:** 200-E-126-PL-B; Segments of 200-E-126-PL Pipeline Located in the Inner Area

**Reclassification:** None

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site has been split into segments. 200-E-126-PL-B is the segments of 200-E-126-PL piping located in the Inner Area. The segments of pipelines associated with 200-E-126-B include a twenty inch diameter poly pipe extending from 207-B to Diverter Station 2, a twenty one inch diameter vitrified clay pipe extending from Diverter Station 2 to the Head End of 216-B-3 Ditches and a twenty four inch corrugated metal pipe extending from Diverter Station #2 to Diverter Station #3.

**Location:** The pipeline segments in this waste site are located inside 200 East Area, west of the Hanford Site Waste Management Units Report
February 2015

2401
Inner/Outer Area boundary. The waste site begins at the 207-B retention basin and terminates at the Inner/Outer Area boundary.

**Related Sites/Structures:** This portion of pipeline is associated with the 207-B Retention Basin and Diverter Station #2.

**Process Description:** The pipeline conveyed B Plant effluent to the 216-B-3 Pond and Ditch system. B Plant cooling water effluent was originally routed through the 207-B Retention Basin to the 216-B-2-1, 216-B-2-2 and 216-B-2-3 ditches. In 1987, the 216-B-2-3 ditch was closed and was replaced by this, 22 inch diameter plastic underground pipeline. It extended from the 207-B basin to Diverter Station #2. By 1994, all of the open ditches (216-B-2-1, 216-B-2-2, 216-B-2-3, 216-B-3-1, 216-B-3-2 and 216-B-3-3) had been backfilled and surface stabilized. After 1994, all the effluent was conveyed to the 216-B-3A and 216-B-3C pond lobes only through underground pipelines. In 1995 the ponds were closed. The remaining effluent was transferred the Treated Effluent Disposal Facility (TEDF). Parts of the pipelines east of 200 East Area, that had fed the ponds, were re-used to feed the TEDF disposal basin. The TEDF portion begins at Manhole #8 and extends to Pump Station #3. In the event of a failure at Pump Station #3, the effluent can be routed to 216-B-3C (C lobe). The section that connects the southeast corner of 216-B-3A to the northwest corner of 216-B-3C is constructed of 76 centimeter (30 inch) corrugated metal pipe.

**Code:** 200-E-127-PL-B

**Names:** 200-E-127-PL-B; Segments of Gable Mountain Pond Pipeline Located in the Inner Area

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site has been split into segments. 200-E-127-PL-B is the segments of pipeline located in the Inner Area. The majority of this pipeline is 36 inch corrugated metal pipe.

When the 241-AP Tank Farm was constructed, a portion of this pipe was re-routed to the east of the new tank farm. The original pipe that was within the boundary of the 241-AP tank farm property was removed during the tank farm construction.

**Location:** 200-E-127-PL-B is the segments of pipe located in the Inner Area. It extends from the 241-A-201 Pump Pit, located east of the PUREX facility to the 207-A Retention Basins, located east of Canton Ave., east of the 242-A Evaporator building. A segment of 21 inch corrugated steel pipe extends from 241-A-401 and connected to the 36 inch 200-E-127-PL-B.

**Process Description:** The pipeline conveyed PUREX and B Plant effluent to the (216-A-25) Gable Pond or the (216-B-3) B Pond system. A segment of 21 inch corrugated steel pipe extends from 241-A-401 and connected to the 36 inch 200-E-127-PL-B. The effluent stream was directed to the preferred pond via Diverter Station #3. The pipeline south of Diverter Station #3 is constructed of 91 centimeter (36 inch) diameter corrugated metal. The portion of the pipeline between the 241-A-201 cooling water storage tanks and the 216-A-42 basin (30 inch VCP) was taken out of service in June 1992.

**Code:** 200-E-135

**Names:** 200-E-135; Contamination Area South of 241-C Tank Farm

**Classification:** Accepted

**Reclassification:** None

Waste Type: Chemicals

Waste Description: The waste includes chemicals used to clean paint brushes and buckets.

Code: 200-E-143-PL

Classification: Accepted

Names: 200-E-143-PL; Encased Transfer Line from 241-AX-151 Diversion Box to 241-A Tank Farms and 244-CR Vault in 241-C Tank Farm; Tank Farm Transfer Lines 4101, 4102, 4103, 4104, 4105, 4106, 4107/V033, 4017, 4018, 4021, 4022 and 8656

Reclassification: None

Type: Encased Tank Farm Pipeline

Status: Inactive

Description: The waste site is an underground concrete encased transfer line associated with twelve ten, 10 centimeter (4 inch) diameter, stainless steel pipes. Groups of lines divert from the encasement at various points along the route to 244-CR Vault. Lines 4101, 4102 and 4103 divert into the south end of 241-A Tank Farm to feed tanks 241-A-101, 241-A-102 and 241-A-103. Lines 4104, 4105, 4106, 4017 and 4018 divert from the encasement at the north end of 241-A Tank Farm to feed tanks 241-A-104, 241-A-105, 241-A-106 and 241-AX-152 Diversion Box. Line 4107 diverts out of the encasement to 241-A-152 Diversion box. Line 8656 continues north to the 244-CR Vault, inside 241-C Tank Farm. Lines 4021 and 4022 are 3 inch diameter “return lines”. These line begin at 241-AX-152 and end at 241-AX-151.

Location: The concrete encased transfer line extends from the 241-AX-151 Diverter Station, near the corner of Route 4 and Buffalo Ave. to 244-CR Vault, inside 241-C Tank Farm.

Related Sites/Structures: The concrete encasement is associated with 241-AX-151, 241-A Tank Farm and 241-C Tank Farm.

Process Description: The system used gravity flow to deliver the waste from the 241-AX-151 Diverter Station to the 244-CR VAULT or the A and AX Tank Farms. Return lines were pressurized. The waste line encasements drained at the low end to the diverter station or tank.

Code: 200-E-144-PL

Classification: Accepted

Reclassification: None

Names: 200-E-144-PL; Encased Transfer Line from 241-CR-152 and 241-CR-153 to 241-AX-151; Lines 4006 and 4007 from 244-AR Vault to 241-AX-151; Tank Farm Transfer Line 4012; Transfer Line 4013 (A-4013)

Type: Encased Tank Farm Pipeline

Status: Inactive

Description: The transfer line is radiologically posted as an Underground Radioactive Material Area. Two, stainless steel pipelines are inside the pipe trench. Lines 4012 and 4013 (A-4013) originate inside the 241-C Farm at the 241-CR-152 and 241-CR-153 Diversion Boxes and terminate at the 241-AX-151 Diverter Station. Both lines are 7.6 centimeter (3 inch) in diameter pipes.

Location: The pipeline extends from 241-C tank farm to 241-AX-151 diversion box, located south of 204 AR, near the corner of 4th Street and Buffalo Ave at the 244-AR Vault facility.
### Related Sites/Structures:
- 200-E-144-PL is associated with 200-E-145-PL and 200-E-147-PL. Line A-4013 is a DUPLICATE entry in sitecode 200-E-146-PL. It is the same line as line 4103 that is described in sitecode 200-E-144-PL.

### Code: 200-E-145-PL
- **Classification:** Accepted
- **Names:** 200-E-145-PL; Interplant Transfer Line; Tank Farm Transfer Line V228; Transfer Pipeline from 241-ER-151 to 241-CR-153
- **Type:** Encased Tank Farm Pipeline
- **Status:** Inactive
- **Description:** The trench that contains lines V228 and PAS-244 is radiologically posted as an Underground Radioactive Material Area. The trench contains two, 3 inch diameter stainless steel pipes.
- **Location:** Line V228 originates in 241-C Farm at the 241-CR-153 Diversion Box, passes through the 241-ER-153 Diversion Box south of 241-C Farm. It continues to the 241-ER-151 Diversion Box. Line PAS-244 is located in the same trench as V228. Line 244 originates at B Plant, and is connected to both 241-ER-151 and 241-ER-152 Diversion Boxes. Both V228 and PAS-244 lines continue into 241-C tank farm at the 241-CR-153 diversion box.
- **Waste Type:** Water
- **Waste Description:** Line V228 transported Purex Supernate (PSN). It contained three curies per gallon of cesium-137, one curie per gallon of strontium 89 and 90 and one curie per gallon of cerium.

### Code: 200-E-147-PL
- **Classification:** Accepted
- **Names:** 200-E-147-PL; Interplant Transfer Line; Tank Farm Transfer Line PAS-244; Transfer Line from 244-CR-TK-003 to 241-ER-153
- **Type:** Encased Tank Farm Pipeline
- **Status:** Inactive
- **Description:** Transfer line PAS-244 is located in the Interplant Transfer pipe trench, per drawing H-2-44501, sheet 92. The pipeline is radiologically posted as an Underground Radioactive Material Area.
- **Location:** Line PAS-244 originates inside 241-C Tank Farm, at the 244-CR Vault (244-CR-TK-003), and enters the 241-ER-153 Diversion Box south of 241-C Farm. Line 244 is located in the same trench as V228 from 241-ER-152 to 241-ER-153. Both lines continue into 241-C tank farm at the 241-CR-153 diversion box. PAS-244 enters 241-ER-152 Diversion Box and terminates at 221-B (B Plant).
- **Related Sites/Structures:** The pipeline is associated with 200-E-144-PL, 200-E-145-PL, 241-ER-152 and 241-ER-153.
**Process Description:**

The stainless steel pipelines, V-228 and PAS-244, are inside the same concrete pipe trench (see 200-E-145-PL). The 241-ER-152 Diversion Box is located on the west side of the pipeline. The 241-ER-153 Diversion Box is located on the east side of the pipeline. These pipelines and two diversion boxes make up the Interplant Transfer Line System. From 244-A to 241-C, lines V228 and PAS-244 join lines 4012 and 4013 (see 200-E-144-PL).

**Waste Type:** Water

**Waste Description:** Line 224 transported Purex Acid Sludge (PAS). It contained one curie per gallon of cesium-137, twenty curies per gallon of strontium 89 and 90 and one curie per gallon of cerium.

**Names:** 200-E-148-PL; Direct Buried Transfer Line from 241-C-151 to 241-A-01A; Tank Farm Transfer Line V109

**Type:** Direct Buried Tank Farm Pipeline  

**Status:** Inactive  

**Description:** Transfer Line V109 is a 5 centimeter (2 inch) diameter, direct buried line, that is radiologically posted as an Underground Radioactive Material Area.

**Location:** Line V109 originates inside the 241-C Farm at the 241-C-151 Diversion Box and terminates at 241-A-01A Pump Pit inside 241-A Farm.

**Related Sites/Structures:** This pipeline passes beneath the Contamination Area known as 200-E-135. Growing contaminated vegetation was found in this area in 2000.

**Process Description:** The 200-E-148-PL pipeline was constructed in 1963 to transfer PUREX Supernate and PUREX Sludge Supernate from tank 241-A-101 (WMA-A) to diversion box 241-C-151 (WMA-C).

</table>

**Names:** 200-E-149-PL; Direct Buried Transfer Line from 241-C-252 to 201-C Hot Semi Works; Tank Farm Pipeline; Tank Farm Transfer Line V175

**Type:** Direct Buried Tank Farm Pipeline  

**Status:** Inactive  

**Description:** Tank Farm Transfer Line V175 is a 2 inch diameter, direct buried, stainless steel Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.

**Location:** Line V175 originates inside 241-C Farm at the 241-C-252 Diversion Box and terminates at the 241-C-201-C Diversion Box in the 201-C Hot Semi Works complex.

**Release Description:** WIDS sitecode 200-E-56 says HW-52860 states that teflon flange gaskets on the stainless steel underground waste line from 201-C to 241-C Tank Farm developed leaks. The leaks caused the underground area next to the east side of the 201-C Building and an underground area near the east facility fence to become contaminated. Radiation readings in 1957 were greater than 100 rad per hour at a depth of 3.66 meters (12 feet) adjacent to the 201-C Building and near the fence. The underground waste line was abandoned and by pass sections installed. New sections of pipeline were installed south of the leaking sections.
### Process Description:

200-E-149-PL consists of a single line, V175, which runs between the 201-C Hot Semi Works Valve Box and the 241-C-252 Diversion Box at the 241-C Tank Farm. V175 was constructed in 1957, and was used for the transport of PUREX process wastes in support of the PUREX pilot plant at Hot Semi-works.

Leaks in the line were identified in 1957. The lines were subsequently addressed by cutting and abandoning the leaking pipe sections and installing bypass lines to the south. These bypass lines were installed in 1957. The abandoned lines adjacent to the Hot Semiworks building were also blanked. From 1961-1967, line V175 was used to transport C-Tank Farm wastes to Hot Semi-works for the recovery of Strontium.

**Related Sites/Structures:**

This pipeline is associated with 201-C and WIDS sitecode 200-E-56 soil contamination event.

- **Reclassification:** None

### Names:

200-E-150-PL: Direct Buried Transfer Line from 244-CR-TK-003 to 201-C Hot Semi Works Valve Box; Tank Farm Pipeline; Tank Farm Transfer Line 8900

### Type: Direct Buried Tank Farm Pipeline

### Status: Inactive

**Description:** Tank Farm Transfer Line 8900 is a direct buried Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.

**Location:** Line 8900 originates at the 201-C Valve Box in the 201-C Hot Semi Works complex and terminates inside 241-C Farm at 244-CR-TK-003 in 244-CR Vault.

**Related Sites/Structures:** This pipeline passes beneath the Contamination Area known as 200-E-135. Growing contaminated vegetation was found in this area in 2000.

### Code: 200-E-151-PL

- **Classification:** Accepted
- **Reclassification:** None

### Names:

200-E-151-PL: Direct Buried Transfer Line from 241-C-104 to 241-A-152; Tank Farm Pipeline; Tank Farm Transfer Line V050

### Type: Direct Buried Tank Farm Pipeline

### Status: Inactive

**Description:** Tank Farm Transfer Line V050 is a 3 inch diameter, schedule 40 steel, process waste pipe. Approximately 48 meters (160 feet) of the line is located inside the tank farm and encased in concrete. The remaining 1700 feet of pipeline direct buried. The site is radiologically posted as an Underground Radioactive Material Area.

**Location:** Line V050 originates inside 241-C Tank Farm at the 241-C-104 tank and terminates at the 241-A-152 Diversion Box, inside 241-A Tank Farm.

**Related Sites/Structures:** The line is associated with 241-C-104, 241-A-152 and pipeline sitecode 200-E-152-PL.

**Process Description:**

The 200-E-151-PL waste site consists of a single waste transfer pipeline that carried PUREX Coating Waste and PUREX Organic Wash Waste between the 241-A and 241-C Tank Farms. The pipeline was constructed in 1951 and placed into service in 1953. A segment from the main
line to the 241-CR-151 diversion box (within Tank Farm C) was abandoned in place and capped in 1966. A new segment within Tank Farm C was re-routed directly to the 241-C-104 Tank. PUREX Coating Waste resulted from the de-cladding of aluminum that encased spent nuclear fuel.

The pipeline was taken out of service in approximately 1985, when Tank Farm transfers were completed and isolation of the 241-A-152 diversion box was performed by plugging all the lines in the diversion box. No releases or losses of transfer fluids associated with this line have been identified.

Related Sites/Structures: Line 812 is associated with UPR-200-E-86. It is a line leak that occurred in 1971. A posted Underground Radioactive Material Area, covered with shotcrete, remains. This pipeline also passes beneath the Contamination Area known as 200-E-135, south of 7th Street. Growing contaminated vegetation was found in this area in 2000.

(containing approximately 25,000 curies of cesium-137) from the 244-AR Vault to the 241-C Tank Farm. The leak was identified on February 25, 1971. Eight test wells were drilled to determine the extent of the subsurface contamination. Wells 4, 5 and 8 found subsurface contaminated soil. Well number 4 found a maximum contamination of 5 rad per hour at the 3 foot and 6 foot levels. No contamination was found below the 20 foot level.

Reclassification: 200-E-154-PL; Direct Buried Transfer Line from 241-C-151 to 241-AX-01A; Tank Farm Pipeline; Tank Farm Transfer Line V113 Direct Buried Tank Farm Pipeline

Inactive

Tank Farm Transfer Line V113 is a 3 inch diameter, direct buried Tank Farm process waste pipe. The site is radiologically posted as an Underground Radioactive Material Area.

Location: Line V113 originates inside 241-C Tank Farm at the 241-C-151 Diversion Box and terminates at 241-AX-01A Pump Pit inside 241-A Tank farm.

Process Description: The 200-E-154-PL waste site consists of a single pipe run (i.e., V113) used to transfer waste between the 241-AX-101 tank and the 241-C-151 diversion box. The pipe exiting the 241-C-151 diversion box is a 3" stainless steel pipe which runs for 36 ft and then converts to a 3" carbon steel pipe running the remaining distance for a total pipe length of 1,983.6 ft. The pipe is direct buried except for the carbon steel elbows which are encased (the elbows in 3" stainless steel section are direct buried). The pipe was constructed in 1963 and operational until 1975 when it failed a pressure test. The pipeline was constructed to transport wastes to and from the AX tanks.

Reclassification: 200-E-155-PL; Pipeline from 241-C Fence to Radioactive Process Sewer Line 2904-CR-1

Radioactive Process Sewer

Inactive

The site is an underground, 5 centimeter (2 inch) diameter, carbon steel pipeline.

Location: The pipeline originates at the 241-C-03A Pump Pit inside the 241-C tank farm and connects to the 30 inch corrugated metal pipe (200-E-237-PL) outside the northeast corner of the 241-C tank farm.

Related Sites/Structures: The pipeline is associated with the 241-C-03A pump pit and the 200-E-237-PL pipeline.

Process Description: 241-C farm condensate was transported to the disposal pond system through this pipeline, that connected to the 30 inch corrugated metal pipe (sitecode 200-E-237-PL).
**Code:** 200-E-156-PL  
**Classification:** Accepted  

**Names:** 200-E-156-PL; 216-C-1 Pipelines; Pipelines from 201-C to 216-C-1  
**Reclassification:** None  

**Type:** Radioactive Process Sewer  
**Status:** Inactive  

**Description:** The site is the underground pipeline that fed the 216-C-1 crib. The eastern portion of the pipeline is a 5 centimeter (2 inch) diameter stainless steel pipe. It connects to a 10 centimeter (4 inch) diameter stainless steel pipe as it enters the crib. It is not separately marked or posted. The pipeline is under the 200-E-41 stabilization cover material.  

**Location:** The pipeline is located inside 200 East Area, south of 7th Street, within the Hot Semiworks stabilized area (sitecode 200-E-41).  

**Related Sites/Structures:** The pipeline is associated with the demolished 201-C facility, the 216-C-1 crib and the 200-E-41 stabilized area.  

**Process Description:** The original crib line is a 10 centimeter (4 inch) diameter stainless steel line extending from the south wall of 201-C to the 216-C-1 crib. In 1954, the 201-C waste was rerouted through a 5 centimeter (2 inch) diameter stainless steel line extending out of the southeast corner of 201-C. The 5 centimeter (2 inch) diameter stainless steel replacement line ties into the original 10 centimeter (4 inch) diameter line north of the 216-C-1 crib. The original 10 centimeter (4 inch) diameter line was re-routed to the 216-C-9 Pond.  

---

**Code:** 200-E-157-PL  
**Classification:** Accepted  

**Names:** 200-E-157-PL; 216-C-10 Pipeline; Pipeline from 201-C to 216-C-10 Crib  
**Reclassification:** None  

**Type:** Radioactive Process Sewer  
**Status:** Inactive  

**Description:** The site is two underground, 5 centimeter (2 inch) diameter stainless steel pipelines that fed the 216-C-10 crib. The original pipeline extended from 201-C to 216-C-10. A second pipeline, from 241-CX vault, tied into the original 216-C-10 crib line after the 216-C-6 crib was deactivated.  

**Location:** The 216-C-10 crib is located east of the Hot Semiworks stabilized area (sitecode 200-E-41). The crib pipeline extends from the demolished 201-C facility, located with the 200-E-41 area, to the 216-C-10 crib.  

**Related Sites/Structures:** The site is associated with 200-E-41, the 216-C-10 crib and the 200-E-171-PL pipeline.  

**Process Description:** The 216-C-10 crib received process condensate and liquid waste from the 201-C Building via this pipeline. A gate valve is located at approximately the mid point of the line, between 201-C and 216-C-10. The line was blanked where it tied into the 216-C-6 crib line (see sitecode 200-E-171-PL).

**Description:***Hanford Site Waste Management Units Report**

February 2015
The waste site is a series of underground pipelines from the 203-A facility to the 216-A-22 and 216-A-28 cribs and drainage from the UNH Truck Apron. The pipeline is a 10 centimeter (4-inch) stainless steel 304 perforated pipe. It is 1.2 meters (4 feet) below grade.

Location: The pipeline and crib are located north of PUREX, and north of the 203-A tank storage area.

Process Description: The 203-A tank farm was used for storage and shipping of uranyl nitrate hexahydrate (UNH) product and concentration of UNH waste. It consisted of 460,000 liter (100,000 gallon) stainless steel tanks for UNH storage and three smaller nitric acid tanks. The 216-A-22 crib received liquid waste from the 203-A sumps and heating coil condensate from the uranyl nitrate tanks and the truck apron. The effluent was routed to the 216-A-28 crib in 1958. The effluent piping to 216-A-28 was blanked off in November 1976 when the flow rate exceeded the infiltration capacity of the 216-A-28 crib.

</tr>
</tbody>
</table>

Process Description: A (3 inch) stainless steel line (V219) diverts from a multi-line encasement (200-E-217-PL) to the 270-E-1 Neutralization Pit. A 15.2 centimeter (6 inch) stainless steel pipeline exits the 270-E-1 tank and connects to a 15.2 centimeter vitrified clay pipe, that goes to the 216-B-12 crib. The pipeline originally carried waste fro 221-U, via the cross site transfer line and 241-ER-151 diversion box, to the 216-B-12 crib. The 270-E-1 neutralization tank was decommissioned in 1967. The 200-E-160-PL pipeline was modified. The 200-E-162-PL pipeline was constructed and the 200-E-160-PL pipeline was routed to tie into 200-E-162-PL, north of the inactive neutralization tank. The modified pipeline carried B Plant process condensate to the 216-B-12 crib. The 200-E-160-PL pipeline was drained and capped with a flange in 1973.
55 Crib; V841

**Type:** Radioactive Process Sewer  
**Start Date:** 1/1/1967

**Status:** Inactive  
**End Date:** 1/1/1976

**Description:** The waste site is an underground, 15 centimeter (6 inch) diameter, carbon steel pipeline that fed the 216-B-55 crib. This line was later cut and capped and replaced with a 20 centimeter (8 inch diameter) carbon steel pipeline.

**Location:** The pipeline originates south of B Plant, at 221-BB. It runs westward to the 216-B-55 Crib.

**Process Description:** The 200-E-161-PL Waste Site was a pipeline that transferred process condensate from the 221-B Building to the 216-B-55 Crib. The pipeline line was originally constructed in 1967. In 1972 this line leaked and caused two Unplanned Releases (UPR-200-E-103 on 3/8/72 and UPR-200-E-44 on 8/16/72). The original (1967) line was cut, capped and abandoned in place. In 1973, a new 8" replacement pipeline was installed south of the original line. In 1976, the replacement pipeline was modified to flow through the 216-B-64 Diversion Pit to an additional pipeline (200-E-163-PL). It was designed to transfer fluids between the 216-B-64 Diversion Pit and the 216-B-64 Retention Basin, but it was never used. The 8" 200-E-163-PL line was cut, capped and abandoned in 1996.

**Related Sites/Structures:** The pipeline is associated with 216-B-62 crib and 216-B-12 crib.

**Process Description:** 200-E-162-PL is a single pipeline built in 1966 to transport B Plant process condensate waste to the 216-B-12 crib. This 2 inch pipeline was tied into 200-E-160-PL to carry process condensate form the 212-B building via 212-BB. A side branch extended into the 216-B-12 Crib (crib 2). In 1969 a new section of pipeline was extended to connect to the newly constructed 216-B-62 Crib. The 216-B-62 crib placed on standby was activated in 1973. It replaced the 216-B-12 crib. The pipeline carried B Plant process condensate waste from B Plant to 216-B-62 crib and crib #2 of 216-B-12.

**This Site has the Following SubSites:**
**Code:** 200-E-162-PL:1  
**Names:** 200-E-162-PL:1; Pipeline from 221-B to 216-B-62 Crib

**Code:** 200-E-162-PL:2  
**Names:** 200-E-162-PL:2; Lateral Pipe to Crib #2 of 216-B-12
**Names:** 200-E-162-PL:1; Pipeline from 221-B to 216-B-62 Crib

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** The pipeline is an underground, 10 centimeter (4 inch) diameter, Fiberglass Reinforced Epoxy pipe.

**Location:** The pipeline originates on the south side of B Plant at the 221-BB Sample Pit. It extends northwest of the 221-B building to the 216-B-62 crib.

---

**The SubSite is Part Of:**

**Code:** 200-E-162-PL

**Names:** 200-E-162-PL; Lateral Line to 216-B-12 Crib #2; Pipeline from 221-BB to 216-B-62 Crib; V842

---

**Code:** 200-E-162-PL:2

**Names:** 200-E-162-PL:2; Lateral Pipe to Crib #2 of 216-B-12

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** Subsite 2 is an underground, 10 centimeter (4 inch) diameter, Fiberglass Reinforced Epoxy pipe. It tees off 200-E-162-PL:1 (216-B-62 main line) to feed the center crib (crib #2) at 216-B-12.

**Process Description:** The pipeline carried B Plant Process Condensate waste to the 216-B-12 crib. The 216-B-62 crib and 200-E-162-PL pipeline were constructed in 1966. The pipeline and side branch fed the 216-B-12 crib until 1973. In 1973, the 216-B-12 crib was deactivated and replaced with the 216-B-62 crib. The side branch was cut and abandoned in place at that time.

---

**The SubSite is Part Of:**

**Code:** 200-E-162-PL

**Names:** 200-E-162-PL; Lateral Line to 216-B-12 Crib #2; Pipeline from 221-BB to 216-B-62 Crib; V842

---

**Code:** 200-E-164-PL

**Names:** 200-E-164-PL; Pipeline Between the 216-A-8 Control Structure and the 216-A-508 Control Structure; Pipeline to 216-A-8 Crib

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** The site is a 41 centimeter (16 inch) diameter, schedule 20 steel pipeline.

**Location:** The pipeline runs eastward, from the 216-A-8 Control Structure (adjacent to 241-A Tank Farm) to the 216-A-508 Control Structure at the north end of the 216-A-8 crib. The crib is located east of the 200 East Area fence.

**Related Sites/Structures:** The pipeline is associated with the 216-A-8 Control Structure, the 216-A-508 Control Structure and the 216-A-8 crib.
### Code: 200-E-165-PL
### Classification: Accepted
### Reclassification: None

### Type: Radioactive Process Sewer
### Status: Inactive

### Description:
The site is a 41 centimeter (16 inch) carbon steel pipeline. The pipeline connects the 216-A-508 Control Structure to the 216-A-524 Control Structure. A 5 centimeter (2 inch) diameter Bypass line extends from the 216-A-524 Control Structure to the third lobe of the crib structure (see subsites).

### Location:

### This Site has the Following SubSites:
#### Code: 200-E-165-PL:1

#### Code: 200-E-165-PL:2
#### Names: 200-E-165-PL:2; Bypass Line

### Code: 200-E-165-PL:1
### Classification: Accepted
### Reclassification: None

### Names: 200-E-165-PL:1; Main Pipeline Between 216-A-508 Control Structure and 216-A-524 Control Structure

### Type: Radioactive Process Sewer
### Status: Inactive

### Description:
The main pipeline is a (16 inch) diameter carbon steel line.

### The SubSite is Part Of:
#### Code: 200-E-165-PL

### Code: 200-E-165-PL:2
### Classification: Accepted
### Reclassification: None

### Names: 200-E-165-PL:2; Bypass Line

### Type: Radioactive Process Sewer
### Status: Inactive

### Description:
A 5 centimeter (2 inch) diameter bypass line extends along the north side of the 216-A-24 crib, from the 216-A-524 Control Structure to the third lobe of the crib.

### The SubSite is Part Of:
#### Code: 200-E-165-PL
Code: 200-E-166-PL  Classification: Accepted
Names: 200-E-166-PL; Pipeline from 241-A Tank Farm to 216-A-34 Ditch  Reclassification: None
Type: Radioactive Process Sewer  Start Date:
Status: Inactive  End Date:
Description: The site is an underground, 38 centimeter (15 inch) diameter, vitrified clay pipe.
Location: The pipeline extends eastward from the 241-A tank farm, beyond the 200 East Area fence, to the head end of 216-A-34.
Release Description: UPR-200-E-145 states - In 1993, while excavating for the installation of a new pipeline (Project W-049H) and exposing existing utility lines, contaminated soil with a radiological reading of 300,000 disintegrations/minute beta-gamma was detected at a depth of 0.8 meter (2.5 feet). The contamination was found above an existing 38 centimeter (15 inch) vitrified clay pipe, which was suspected to be the source. Sample analysis of the green colored soil indicated it was uranium oxide.
Related Sites/Structures: The site is associated with the 216-A-8 Sample Pit (control structure) and the 216-A-34 ditch. UPR-200-E-145 found contamination associated with this pipeline.
Process Description: The 216-A-34 ditch received cooling water from the contact condenser in the 241-A-431 building via a VCP pipeline.

Code: 200-E-167-PL  Classification: Accepted
Names: 200-E-167-PL; Lines SN-215 and SN-216; Underground Pipelines from 244-A Lift Station to 241-A-A and 241-A-B Valve Pits  Reclassification: None
Type: Encased Tank Farm Pipeline  Start Date:
Status: Inactive  End Date:
Description: The waste site is two underground, carbon steel pipelines.
Location: The pipeline is located south of 7th Street and west of Buffalo Ave., inside 200 East Area.
Related Sites/Structures: The pipelines are associated with the 244-A Lift Station and the 241-A Tank Farm.
Process Description: Lines SN-215 and SN-216 are in the same trench that connects 244-A Lift Station with the 241-A-A and 241-A-B Valve Pits. They are double contained (pipe-in-pipe), carbon steel lines that are surrounded by a minimum of 7.6 centimeters (3 inches) of polyurethane insulation. The interior pipe is 7.6 centimeter (3 inch diameter) schedule 40 pipe. The outer pipe is 15.2 centimeter (6 inch diameter) schedule 40 pipe.

Code: 200-E-168-PL  Classification: Accepted
Names: 200-E-168-PL; Underground Pipeline from 203-A to 216-A-3  Reclassification: None
Type: Radioactive Process Sewer  Start Date: 1/1/1956
Status: Inactive  End Date: 1/1/1967
Description: The waste site an underground, 10 centimeter (4-inch) Schedule 10 perforated 304 stainless steel pipe placed horizontally 2.4 meters (8 feet) below grade. Two 6.1 meter (20 foot) lengths
of this pipe placed perpendicularly to the first pipe, forming an H pattern inside the crib.

**Location:** The pipeline is located north of 202-A (PUREX) and south of the 275-EA building.

**Related Sites/Structures:** The pipeline is associated with 216-A-3 crib.

**Process Description:** From 1956 to 1967, the site received silica-gel regeneration waste and pump house drainage from 203-A and drainage from the UNH storage pit. The silica gel discharge was discontinued in 1967.

**Code:** 200-E-169-PL  
**Names:** 200-E-169-PL; Pipeline from 201-C and 215-C to the 216-C-3 Crib  
**Type:** Radioactive Process Sewer  
**Status:** Inactive  
**Description:** The waste site is an underground vitrified clay pipeline that fed the 216-C-3 crib. The diameter of the vitrified clay pipe varied from 10 centimeters (4 inch) to 15 centimeters (6 inch).

**Location:** The pipeline extends from the 215-C building and the 201-C (demolished) building to the 216-C-3 crib. The majority of the pipeline is located west of the 201-C building.

**Related Sites/Structures:** The site is associated with the 216-C-3 crib and pipeline 200-E-255-PL.

**Code:** 200-E-170-PL  
**Names:** 200-E-170-PL; Pipeline from 276-C to 216-C-4 Crib  
**Type:** Radioactive Process Sewer  
**Status:** Inactive  
**Description:** The waste site is an underground 5 centimeter (2 inch) diameter, stainless steel pipeline from 276-C to the 216-C-4 crib. Also included is a 2.5 centimeter (1 inch) diameter stainless steel line from 201-C to 276-C.

**Location:** The pipeline runs southwest of the 276-C building, west of the demolished 201-C facility.

**Related Sites/Structures:** The site is associated with the 216-C-4 crib.

**Process Description:** The crib received waste from the 276-C Solvent Handling building.
Description: The waste site is an underground 5 centimeter (2 inch) diameter carbon steel pipeline.

Location: The pipeline is located south of 7th Street, and west of the 216-C-10 crib.

Related Sites/Structures: The pipeline is associated with the 216-C-6 crib, the 241-CX vault and the 200-E-157-PL pipeline.

Process Description: The 216-C-6 crib received radioactive REDOX and PUREX type process condensate from 201-C and 241-CX vault floor drainage via this pipeline. When the 216-C-6 crib was discontinued, the effluent was diverted to the 216-C-10 crib via pipeline 200-E-157-PL.

---

Description: The site is an underground 5 centimeter (2 inch) stainless steel pipeline.

Location: The pipeline is located south of the 209-E building.

Related Sites/Structures: The pipeline is associated with the 216-C-7 crib.

Process Description: The 209-E building was designed to perform critical mass experiments using plutonium nitrate solutions and enriched uranium. At the completion of an experiment, the waste in the Neutron Reflector Tanks was discharged to a 222 liter (60 gallon) buried waste tank outside the building (Critical Mass Laboratory Valve Pit and Hold Up Tank [209-E-TK-111]). After sampling, the tank contents that were below levels of concern were discharged to the 216-C-7 crib.

---

Description: The site is an underground 5 centimeter (2 inch) diameter, carbon steel pipeline.

Location: The pipeline is located south of the demolished 201-C facility. It curves around the 216-C-1 crib area.

Process Description: The pipeline carried High Salt Waste that had passed through the 241-CX-71 neutralization tank to the 216-C-5 crib.

---

Description: The site is an underground 5 centimeter (2 inch) diameter, carbon steel pipeline.

Location: The pipeline is located south of the demolished 201-C facility. It curves around the 216-C-1 crib area.

Process Description: The pipeline carried High Salt Waste that had passed through the 241-CX-71 neutralization tank to the 216-C-5 crib.
Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel pipeline. The pipeline extends north and south from the 221-BC building and east to west from the 222-B laboratory and the 221-BC building.

Location: The pipeline is located south of the 221-B building.

Related Sites/Structures: The pipeline is associated with the 216-B-10 A & B cribs, 200-E-179 catch tank, the 222-B laboratory and the 221-BC building.

Process Description: In 1949, the pipeline began to carry waste from the 222-B laboratory sink and sample slurper to the 216-B-10A and 10B cribs. In 1969, flow to the 216-B-10A crib was terminated. The pipeline was rerouted to feed only the 216-B-10B crib (see subsite 3). An in-line catch tank was added to the pipeline (see sitecode 200-E-179). The pipeline was extended northward to provide drainage from the 221-BC building. The pipeline and catch tank were abandoned in 1974.

This Site has the Following SubSites:

Code: 200-E-174-PL:1
Names: 200-E-174-PL:1; East/West Pipeline from 222-B

Reclassification: None
Type: Radioactive Process Sewer
Status: Inactive
Description: Pipe installed to redirect flow to only the 216-B-10B crib after 216-B-10A was terminated.

The SubSite is Part Of:
Code: 200-E-174-PL
Names: 200-E-174-PL; 216-B-10 (A&B) Pipeline; Pipeline from 221-BC and 222-B to 216-B-10 A&B Crib

Code: 200-E-174-PL:4
Names: 200-E-174-PL:4; Pipeline Connecting 216-B-10A to 216-B-10B
Type: Radioactive Process Sewer
Status: Inactive
Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel tubing pipeline.
Location: The pipeline is located southeast of the 221-B building. It runs diagonally from the 292-B building to the 216-B-10 A crib.
Related Sites/Structures: The pipeline is associated with the 216-B-10A crib.
Process Description: The pipeline carried floor drainage waste from the 292-B building to the 216-B-10 A crib.

Code: 200-E-176-PL-A
Names: 200-E-176-PL-A; Pipeline from 242-B to 216-B-11-A&B, Portion of pipeline outside the 241-B fence
Type: Direct Buried Tank Farm Pipeline
Status: Inactive
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter, carbon steel pipeline.
**Location:** The pipeline extends northward from the 242-B Evaporator building to the 216-B-11 A cribs, crossing through the 241-B tank farm. This waste site is two segments of pipeline (north portion and south portion) that are outside the 241-B tank farm fence. The north portion of this pipeline extends from the north 241-B fence to the 216-B-11A & B reverse wells. The south portion extends from the 242-B building to the tank farm fence.

| Code:       | 200-E-184-PL | Classification: Accepted |
| Names:     | 200-E-184-PL; Lines V010 and V011; Pipeline from 241-A-151 Diversion Box to 216-A-2 Crib | Reclassification: None |
| Type:      | Radioactive Process Sewer | Start Date: |
| Status:    | Inactive | End Date: |
| Description: | The waste site is two parallel, 10 centimeter (4 inch) diameter, vitrified clay pipes that fed the 216-A-2 crib. The two lines are direct buried in the same soil trench. |
| Location:  | The pipelines are located south of the 202-A facility and west of the 216-A-4 crib. |
| Process Description: | Waste lines V010 and V011 originated at the 241-A-151 Diversion Box (see sitecode 200-E-183-PL). They are direct buried in the same soil trench with lines V014, V016 and T167. At a point just north of the 216-A-4 crib, the lines separate. Three lines (V014, V016 and T167) tie into the 216-A-4 crib structure. Lines V010 and V011 split off and tie into the 216-A-2 crib structure. The line numbers V010 and V011 indicate the specific waste stream. When the 216-A-2 crib was abandoned, the pipelines were cut. The effluent was redirected to the 216-A-31 crib by extending lines V010 and V011 (see sitecode 200-E-186-PL). |

| Code:       | 200-E-185-PL | Classification: Accepted |
| Names:     | 200-E-185-PL; Lines V014 and V016; Pipeline from 241-A-151 Diversion Box to 216-A-4 Crib | Reclassification: None |
| Type:      | Radioactive Process Sewer | Start Date: |
| Status:    | Inactive | End Date: |
| Description: | The waste site consists of two, stainless steel pipelines, direct buried in the same soil trench. Lines V014 and V016 are 7.6 centimeter (3 inch) stainless steel pipes. Lines V010 and V011 |
are buried adjacent to lines V014 and V016 in the same soil trench (see sitecode 200-E-183-PL). Lines V014 and V016 connect into the 216-A-4 crib structure using a Double Y Connection to connect into the vitrified clay crib distribution pipes. Line T167 enters the soil trench just north of the 216-A-4 crib (see sitecode 200-E-196-PL).

**Location:** The 216-A-4 crib lines are located south of 202-A. The enter the north side of the crib structure.

**Process Description:** The line numbers indicate a specific waste stream. Waste lines V014, V016 originate at the 241-A-151 Diversion Box. They are direct buried in the same soil trench with lines V010, V011. At a point just north of the 216-A-4 crib, the lines separate. Near the north side of the 216-A-4 crib, line T022 from the 291-A Control House, enters the pipe trench and ties into line T167, becoming part of line T167 (see sitecode 200-E-196-PL). Line T167 is connected to the 216-A Sample Pit. These three lines (V014, V016 and T167) tie into the 216-A-4 crib structure. Lines V010 and V011 split off and tie into the 216-A-2 crib structure. Line V014 was later rerouted to 216-A-TK-2 and blanked off.

**Code:** 200-E-186-PL  
**Classification:** Accepted  
**Reclassification:** None  
**Type:** Radioactive Process Sewer  
**Status:** Inactive  
**Description:** The waste site is two underground, 7.6 centimeter (3 inch) diameter, stainless steel pipes that are buried in the same soil trench.  
**Location:** The pipelines are located south of 202-A. The 216-A-31 crib pipelines originate at a point where the 216-A-2 crib lines were abandoned.  
**Related Sites/Structures:** The site is associated with the 216-A-31 crib and pipeline 200-E-184-PL.  
**Process Description:** When discharge to the 216-A-2 crib was discontinued, flow was diverted to the 216-A-31 crib through two stainless steel pipelines. The line numbers V010 and V011 indicate the waste stream was diverted from 216-A-2 to 216-A-31.
Location: The chemical sewer line extends from the north side of the 202-A facility and runs eastward to the head end of the 216-A-29 ditch.

Related Sites/Structures: The waste site is associated with the PUREX facility and the 216-A-29 ditch.

Process Description: The pipeline carried PUREX chemical sewer waste to the 216-A-29 ditch. The 241-A Tank Farm was constructed during 1984 and 1985. The head end of the 216-A-29 ditch was relocated and a portion of the chemical sewer was re-routed north of the new tank farm on the north side of 4th Street. A short piece of the original 183 centimeter (36 inch) diameter corrugated metal pipe remains near the north side of the 272-AW building.

<tr>
<td>Description:</td>
<td>The site is the underground 38 centimeter (15 inch) diameter vitrified clay pipe and a section of 40 centimeter (16 inch) diameter steel piping, from B-Plant to the valve box east of the 207-B Retention Basin. The pipeline is also known as 2904-E-2 and the B Plant Chemical Sewer. The pipelines are marked above ground with steel posts and &quot;Underground Radioactive Material/Pipeline&quot; signs. Access manholes are located at intervals along the length of pipelines. Vegetation over the pipelines consists of grass and tumbleweeds, with several areas of bare soil.</td>
<td></td>
</tr>
</tbody>
</table>

Location: The 2904-E-2 chemical sewer line runs from the north side of 221-B to the east side of the 207-B Retention Basin. The 2904-E-2 pipeline bypasses the retention basin to discharge directly into the 216-B-2 ditches.

Release Description: UPR-200-E-138 is associated with the B Plant chemical sewer pipeline. On March 22, 1970, a leaking manometer sensing line from the 8-1 Tank inside the 221-B Building was flushed down a floor drain connected to a chemical sewer that contaminated the 216-B-2-2 Ditch and the 216-B-3 Pond. The pipeline bypasses the 207-B Retention Basin so the retention basin was not contaminated as a result of this release, but the release did contaminate the 216-B-2-2 ditch. On March 23, 1970 at 6:00 am, a dose rate of 5 R/hr was noted at check point number one of the 216-B-2-2 Ditch.

Process Description: The 200-E-188-PL (2904-E-2) pipeline bypassed the retention basin to discharge directly into the 216-B-2 ditches. H-2-35495 shows the chemical sewer pipe being cut and plugged south of the valve pit in 1970. Two new 40 centimeter (16 inch) diameter steel pipes (see sitecode 200-E-205-PL) were installed to route effluent to the 216-B-2-3 ditch (see 200-E-205-PL). The piping and valve configuration allowed flow to be diverted to the 216-B-63 ditch (See 200-E-191-PL) or the 216-B-2-3 ditch.

Description: The waste site is an underground neutralization tank.

Location: The tank is located south of PUREX, south of the 291-A stack.

Related Sites/Structures: The tank is associated with the 291-A stack and the 216-A-TK-2 catch tank and pipeline 200-E-196-PL.

Process Description: The tank held calcium carbonate that changed the pH of the 291-A stack condensate waste via line T021. It flowed into 216-A-TK-2 (sitecode 200-E-190) via line T162 and eventually released to cribs via line T167.

---

Code: 200-E-190  
Classification: Accepted

Names: 200-E-190; 216-A-TK-2 Catch Tank

Type: Catch Tank

Start Date:  
End Date:  

Description: The waste site is an underground catch tank.

Location: The catch tank is located south of PUREX and west of the 216-A Sample Pit.

Related Sites/Structures: Line V014 is described in sitecode 200-E-185-PL. Line T167 is described in 200-E-196-PL.

Process Description: Multiple waste lines from the 216-A Sample Pit fed the catch tank. Waste was jetted from the catch tank to the 216-A-21 crib.

---

Code: 200-E-191-PL  
Classification: Accepted

Names: 200-E-191-PL; 216-B-63 Pipeline; Pipeline from 207-B Valve Pit to 216-B-63 Ditch

Type: Radioactive Process Sewer

Start Date:  
End Date:  

Description: The waste site is an underground, 38 centimeter (15 inch) diameter, vitrified clay pipeline. The vitrified clay pipeline is connected to the valve pit on the east side of the 207-B Retention basin by a short piece of 41 centimeter (16 inch) diameter carbon steel pipe.

Location: The pipeline is located northeast of the 207-B Retention Basin.

Related Sites/Structures: The pipeline is associated with the 216-B-63 ditch and the 207-B Retention Basin.

Process Description: The pipeline fed the 216-B-63 ditch.

---

Code: 200-E-192-PL  
Classification: Accepted

Names: 200-E-192-PL; 216-A-10 Pipelines; Lines from Sample Pit 4 to 216-A-10 Crib

Type: Radioactive Process Sewer

Start Date: 1/1/1956
The original pipeline to 216-A-10 crib is an underground, 20 centimeter (8 inch) diameter, vitrified clay pipe. The original pipe connected to the center crib distribution line. The 216-A-10 replacement pipeline is an underground, 20 centimeter (8 inch) diameter stainless steel pipeline. The replacement pipeline connected to a new distribution pipe, east of the original distribution pipe.

The pipelines to the 216-A-10 crib are located south of PUREX, southwest of 216-A-5.

The pipeline is associated with the 216-A-10 crib and Sample Pit number 4.

On April 19, 1962, the clay distributor pipe to the 216-A-10 crib collapsed and caused a surface depression. A new distributor (replacement) line was installed parallel to the collapsed line. The replacement line failed in 1966.

This Site has the Following SubSites:

**Code:** 200-E-192-PL:1
**Names:** 200-E-192-PL:1; Original Vitrified Clay Crib Pipeline

**Code:** 200-E-192-PL:2
**Names:** 200-E-192-PL:2; 216-A-10 Replacement Pipeline

The original crib pipeline is a 20 centimeter (8 inch) vitrified clay pipeline.

The SubSite is Part Of:

**Code:** 200-E-192-PL
**Names:** 200-E-192-PL; 216-A-10 Pipelines; Lines from Sample Pit 4 to 216-A-10 Crib

The replacement pipeline is constructed of 20 centimeter (8 inch) diameter stainless steel.

The SubSite is Part Of:

**Code:** 200-E-193-PL
**Names:** 200-E-193-PL; Line X015; Pipeline from 202-A and 293-A to 216-A-21 Crib

**Classification:** Accepted

**Reclassification:** None
Type: Radioactive Process Sewer  Start Date: 
Status: Inactive  End Date: 
Description: The waste site is an underground, 15 centimeter (6 inch) diameter, vitrified clay pipeline. It extends from the 293-A building to the 216-A-21 crib.

Location: The pipeline is located south of PUREX and east of the 216-A-4 crib.

Process Description: The 216-A-21 crib received sump waste from 293-A Building, laboratory cell drainage from the 202-A Building, and the 291-A-1 Stack drainage via this pipeline. The VCP line was later replaced with a stainless steel line (see sitecode 200-E-196-PL).

Code: 200-E-194-PL  Classification: Accepted
Names: 200-E-194-PL; Pipeline from 202-A to 216-A-32 Crib  Reclassification: None

Type: Radioactive Process Sewer  Start Date: 
Status: Inactive  End Date: 
Description: The waste site is an underground, 15 centimeter (6 inch) diameter, vitrified clay pipeline that fed the 216-A-32 crib.

Location: The 216-A-32 crib and pipeline are located northeast of 202-A and west of the 2607-EE septic tank and tile field.

Related Sites/Structures: The pipeline is associated with the 202-A canyon and the 216-A-32 crib.

Process Description: The 216-A-32 crib received the 202-A canyon crane maintenance facility floor, sink, and shower drainage via this pipeline.

Code: 200-E-195-PL  Classification: Accepted
Names: 200-E-195-PL; Line V204; Pipeline form 241-B-154 Diversion Box to 241-B-361 Settling Tank and 216-B-9 Crib  Reclassification: None

Type: Radioactive Process Sewer  Start Date: 
Status: Inactive  End Date: 
Description: The site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel pipeline to the 241-B-361 Settling Tank that was later extended to the 216-B-9 crib. Line V204 begins at the 241-B-154 Diversion Box. Line 204 is in the same soil trench as several other tank farm lines (see sitecode 200-E-199-PL), but diverted to the 241-B-361 Settling Tank and later routed to the 216-B-9 crib.

Location: The pipeline is located northeast of 221-B, north of the 216-B-5 Reverse Well.

Release Description: UPR-200-E-7 states that a process waste line leak from 221-B caused the ground to cave-in near the 361-B crib (216-B-9). Approximately 5000 gallons of liquid was lost to the ground over an area approximately 30 square feet. The maximum dose rate was 1.7 rads/hour. The contamination was covered in 1954 and delineated with a chain. It was posted as Underground Hanford Site Waste Management Units Report  
February 2015  
2429
Process Description:
The 216-B-9 Crib and Tile Field were built in 1947 to replace the 241-B-361 Settling Tank and the 216-B-5 Reverse well. Line V204 was cut and rerouted to the 216-B-9 crib.

Related Sites/Structures:
The pipeline is associated with 221-B, the 216-B-9 crib, 241-B-361 and pipeline 200-E-199-PL.

<td></td>
<td></td>
</tr>
</tbody>
</table>
216-A-27 cribs. Portions of the line range in diameter from 5 centimeters (2 inch) to 7.6 centimeter (3 inch) diameter and 10 centimeter (4 inch). diameter.

**Location:** The pipeline is located south of 202-A. It originates at the 216-A-4 Sample Pit. The line originally fed the 216-A-4 crib, but later was extended further south (twice) to feed the 216-A-21 and 216-A-27 cribs.

**Process Description:** Line numbers indicate a specific waste stream. The T167 pipeline originally fed the 216-A-4 crib from the 216-A-4 sample building. Line T022 from the 291-A Fan Control House tied into T167 just north of the 216-A-4 crib. These lines are buried in the same soil trench as the lines described in 200-E-183-PL (V010, V011, V014 and V016). When the 216-A-4 crib was deactivated, line T167 was rerouted to the 216-A-21 crib. When the 216-A-21 crib was deactivated, line T167 was rerouted to feed the 216-A-27 crib. A branch of this pipeline tied to the 216-A-36 crib pipeline (see sitecode 200-E-253-PL).

---

**Code:** 200-E-198-PL  
**Classification:** Accepted  
**Reclassification:** None

**Names:** 200-E-198-PL; Encased Tank Farm Pipeline from 241-BX-154 Diversion to 241-BX-155 Diversion Box; Lines 8902, V282, V283, V284 and V285

**Type:** Encased Tank Farm Pipeline  
**Status:** Inactive  
**Description:** The waste site is an underground concrete transfer line encasement. Lines V282, V283, V284 and V285 are 9 centimeter (3.5 inch) diameter stainless steel lines. Line V285 diverts from the encasement and connects to transfer line 200-E-199-PL. Line 8902 diverts from the encasement and connects to 200-E-116-PL (H-2-44501, sht 86).

**Location:** The encased transfer line extends between 241-BX-154 Diversion Box, on the south side of 221-B to the 241-BX-155 Diversion Box located northeast of 221-B. The majority of this encased line is located on the west side of Baltimore Ave.

**Related Sites/Structures:** The waste lines are associated with B Plant processes, the 241-BX-154 Diversion Box and the 241-BX-155 Diversion Box.

---

**Code:** 200-E-199-PL  
**Classification:** Accepted  
**Reclassification:** None

**Names:** 200-E-199-PL; Lines V204, V206, V208, V209, V211, V213, V215, and V285; Tank Farm Lines from 241-B-154 Diversion Box to 241-B Tank Farm

**Type:** Direct Buried Tank Farm Pipeline  
**Status:** Inactive  
**Description:** The waste site is a group of underground stainless steel transfer lines buried in a common soil trench. All of the pipelines are 9 centimeter (3.5 inch) diameter stainless steel lines. Line V285 diverts from 200-E-198-PL to become part of 200-E-199-PL. V285 also has includes a 2 inch drain line from the encasement that connects to the 241-B-302 Catch Tank (H-2-44501, sht 96).

**Location:** The transfer line extends between the 241-B-154 Diversion Box, located at the corner of 7th
Street and Baltimore Ave. and the 241-B Tank Farm. This transfer line is located on the east side of Baltimore Ave.

**Release Description:** The exact location of the UPR-200-E-7 cave-in on the process line can not be determined from the available documentation. HW-60807 states that in 1954 a cave in occurred near the 361-B crib (alias 216-B-9 crib). The hand drawn sketch in HW-60807 shows the Unplanned Release location as being south and slightly west of the 361-B Reverse Well (216-B-5), approximately where the 241-B-361 tank is located. This location is approximately 125 meters (400 feet) southwest of the south edge of the posted 216-B-9 crib. It is near where pipelines 200-E-199-PL and 200-E-195-PL connect.

**Related Sites/Structures:** The waste site is associated with the 241-B-151, 241-B-152, 241-B-154 Diversion Boxes, UPR-200-E-7 and pipelines 200-E-195-PL, 200-E-198-PL, 200-E-199-PL and 200-E-277-PL.

**Process Description:** Lines V208, V209 and V211 extend between 241-B-154 Diversion Box and 241-B-152 Diversion Box (inside 241-B Tank Farm). Lines V213 and V215 extend between 241-B-154 Diversion Box and 241-B-151 Diversion Box (inside the 241-B Tank Farm). Line V285 enters the 200-E-199-PL encasement north of 241-B-154 Diversion Box from the encasement described in 200-E-198-PL. Line V204 diverted to the 241-B-361 Settling tank and was later extended to the 216-B-9 crib (see sitecode 200-E-195-PL).

**Code:** 200-E-201-PL  **Classification:** Accepted

**Names:** 200-E-201-PL; Lines V315 and V319; Transfer Lines from 241-BX-155 to Diversion Boxes in 241-B Tank Farm

**Type:** Direct Buried Tank Farm Pipeline  **Start Date:**

**Status:** Inactive  **End Date:**

**Description:** The waste site is two underground, 9 centimeter (3.5 inch) diameter stainless steel pipelines buried in the same soil trench. Lines V315 and V319 divert out of a bundle of lines described in sitecode 200-E-202-PL.

**Location:** The transfer lines extend between the 241-BX-155 Diversion Box, on the west side of Baltimore Ave. and connect into the 241-B-151 and 241-B-152 Diversion Boxes located inside 241-B Tank Farm on the east side of Baltimore Ave.

**Related Sites/Structures:** The transfer lines are associated with B Plant processes, Diversion Boxes 241-BX-155, 241-B-151 and 241-B-152 and pipeline 200-E-202-PL.

</table>

**Release Description:**
- UPR-200-E-32: On November 7, 1963, a coil leak developed in the 221-B Building 6-1 Tank (utilized for storing the cerium-rare earth fraction of the fission product stream) which resulted in gross contamination of the 207-B Water Retention Basin and the head end of this unit. After damming off the site approximately 705 meters (1,000 feet) downstream from the head end discharge pipe, the contaminated basin water was flushed into the unit. General dose rates were 500 mR/hr. Tumbleweed that had blown into the 216-B-2-1 ditch were found to be reading 50 R/hr.
- UPR-200-E-138: In March 1970, approximately 1000 curies of strontium-90 was released to the 216-B-2-2 ditch via the Chemical Sewer.

**Related Sites/Structures:**
The pipeline is associated with the 207-B Retention Basin and the 216-B-2-1 and 216-B-2 ditches.

DOE/RL-88-30
Rev. 24

Reclassification: 200-E-207-PL; Encased Transfer Line from 241-A-151 Diversion Box to 241-A-152 Diversion Box; Lines V004, V005, V006, V007 and V008

Description: The waste site is an underground concrete encasement containing five stainless steel pipelines. Each of the five pipelines is a 9 centimeter (3.5 inch) diameter stainless steel line.

Location: The concrete encasement originates at the 241-A-151 Diversion Box, on the south side of the PUREX building. It runs eastward and turns north to connect with the 241-A-152 Diversion Box, located inside the 241-A Tank Farm. The line crosses under both Canton Ave. and 4th Street.

Release Description: UPR-200-E-67 states that a release occurred on May 7, 1984. An old, contaminated pipe encasement, located under 4th Street north of the 272-AW parking lot, was encountered during the excavation. Contamination levels ranged from 1 to 1.5 milirad per hour.

Related Sites/Structures: The pipelines are associated with the 241-A-151 and 241-A-152 Diversion Boxes.

Code: 200-E-207-PL
Names: 200-E-207-PL; Encased Transfer Line from 241-A-151 Diversion Box to 241-A-152 Diversion Box; Lines V004, V005, V006, V007 and V008
Type: Encased Tank Farm Pipeline
Status: Inactive
Classification: Accepted
Reclassification: None
Start Date:
End Date:

Code: 200-E-209-PL
Names: 200-E-209-PL; Pipeline from 272-BB to 200-E-25 Dry Well
Type: Process Sewer
Status: Inactive
Classification: Accepted
Reclassification: None
Start Date:
End Date:

Description: The waste site is an underground, 5 centimeter (2 inch) diameter, carbon steel pipeline.

Location: The pipeline is located north of B Plant. It extends northward from the 272-BB building to the 200-E-25 french drain.

Related Sites/Structures: The pipeline is associated with the 200-E-25 french drain.

Code: 200-E-213-PL
Names: 200-E-213-PL; Lines V200, V329, V330, V331, V332, V333, and V334; Transfer Lines from 221-B to 241-B-154 Diversion Box
Type: Direct Buried Tank Farm Pipeline
Status: Inactive
Classification: Accepted
Reclassification: None
Start Date:
End Date:

Description: The waste site is seven underground stainless steel pipelines buried in the same soil trench. All of the lines are 9 centimeter (3.5 inch) diameter pipes.

Location: The transfer lines originate in various cells inside 221-B. They meet south of 221-B and run east to the 241-B-154 Diversion Box. They cross under Baltimore Ave.

Related Sites/Structures: The lines are associated with 221-B and 241-B-154 Diversion Box.

Hanford Site Waste Management Units Report
February 2015
Process Description: These transfer lines originate inside 221-B. They are not encased in concrete and do not connect to the 241-BX-154 Diversion Box. They were part of the original 1945 B Plant construction.

Code: 200-E-214-PL  Classification: Accepted
Names: 200-E-214-PL; Pipeline from 291-B Sand Filter to the 200-E-55 French Drain  Reclassification: None
Type: Radioactive Process Sewer  Start Date: 1/1/1945
Status: Inactive  End Date: 1/1/1997
Description: The waste site is an underground, 15 centimeter (6 inch) diameter, stainless steel pipe.
Location: The pipe to the 200-E-55 french drain is located on the east side of the 291-B Sand Filter structure, southeast of B Plant.
Related Sites/Structures: The site is associated with the B Plant Sand Filter (sitecode 200-E-30) and the 200-E-55 French Drain.
Process Description: The 200-E-55 french drain received condensate from the B-Plant canyon sand filter and rain water that leaked through the sand filter roof through this pipe.

Code: 200-E-215-PL  Classification: Accepted
Names: 200-E-215-PL; Line V229; Transfer Line Between 241-ER-151 Diversion Box and 241-ER-152 Diversion Box  Reclassification: None
Type: Direct Buried Tank Farm Pipeline  Start Date:
Status: Inactive  End Date:
Description: The waste site is a direct buried underground, 7.6 centimeter (3 inch) diameter stainless steel pipe inside a 15 centimeter (6 inch) carbon steel pipe.
Location: The transfer line is located southwest of B Plant. It runs between 241-ER-151 and 241-ER-152 Diversion Boxes. The line crosses under Atlanta Ave.
Related Sites/Structures: The line is associated with 241-ER-151, 241-ER-152 and 200-E-147-PL.

Code: 200-E-217-PL  Classification: Accepted
Names: 200-E-217-PL; Encased Transfer Line from 241-ER-151 Diversion Box to 241-BX Tank Farm; Lines 9808, 9653, 9719 and V225  Reclassification: None
Type: Encased Tank Farm Pipeline  Start Date:
Status: Inactive  End Date:
Description: The waste site is four underground stainless steel lines inside a concrete encasement. Each line is 9 centimeters (3.5 inches) in diameter. Line V225 diverts out of the encasement and extends to 241-B Tank Farm.
Location: The encased transfer line extends north from the 241-ER-151 Diversion box and angles
northeast to connect with the 241-BX tank Farm. Line V225 diverts out of the encasement adjacent to the north side of the 218-E-2 Burial ground. It extends eastward to the 241-B Tank Farm.

**Related Sites/Structures:** The line is associated with the 241-ER-151 Diversion Box and the 241-B and 241-BX Tank Farms. The pipeline crosses through the 218-E-5A Burial Ground.

  - Status: Inactive
  - Description: Subsite 3 is Lines V021 that transfer between 241-A-151 Diversion Box and 241-AW Tank Farm; V022; V023.
Description: The waste site is three, 7.6 centimeter (3 inch) diameter, stainless steel pipes buried in the same soil trench. Each pipe is double contained inside a 15 centimeter (6 inch) steel pipe.

Location: The lines are located on the south and northeast sides of the PUREX facility. The lines go east out of the 241-A-151 Diversion Box, along the south wall of 202-A. The lines turn north and continue to the west side of the 241-AW tank farm. The lines connect to the 241-AW-A and 241-AW-B valve pits, inside the 241-AW tank farm.

Related Sites/Structures: The lines are associated with the 241-A-151 diversion box and the 241-AW A and B valve pits.

---

Code: 200-E-219-PL
Type: Radioactive Process Sewer
Status: Inactive
Description: The waste site is an underground, 35.5 centimeter (14 inch) diameter, carbon steel distribution line that fed the eight BY cribs. A 5 centimeter (2 inch) diameter carbon steel by-pass drain line is located at 216-B-50 crib.
Location: The eight BY cribs are located north of the 216-BY tank farm. The pipes that fed the cribs originate on the north side of the 216-BY-201 siphon tank.
Process Description: The pipeline distributed uranium recovery waste from the 241-BY tank farm to the 241-BY cribs.

This Site has the Following SubSites:

</tbody>
</table>
Process Description: BC Cribs and Trenches. The valve pit contains six iron gate valves. The entire scavenging mission necessitated the construction of the transfer system using pipelines 2805-E1, 2805-E2, 2805-E3 and 2805-E4 (sitecode 200-E-114-PL). The entire system can be traced on the series of H-2-2900 thru 2909. The valve box allowed waste to move north to the BY cribs or south to the BC cribs.

Approximately 31 million gallons of supernate was discharged through the pipelines within this valve pit between 1956 and 1958. There is no record of releases at the valve pit or modifications to the valve pit in the historical record.

Type: Encased Tank Farm Pipeline
Status: Inactive
Classification: Accepted
Reclassification: None
Description: The waste site is an underground, 9 centimeter (3.5 inch) diameter, stainless steel drain line that is encased in concrete.
Location: The 241-A-151 diversion box and 241-A-302A catch tank are located on the south side of the PUREX facility. The drain line extends between the two structures.
Related Sites/Structures: The drain line is associated with the 241-A-151 Diversion Box and the 241-A-302A catch tank.

Code: 200-E-225-PL
Names: 200-E-225-PL; Line V720; Transfer Line from 241-AR-151 Diversion Box to 241-AY-102 Tank
Type: Direct Buried Tank Farm Pipeline
Status: Inactive
Classification: Accepted
Reclassification: None
Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter stainless steel pipe encased within a 15 centimeter (6 inch) diameter pipe.
Location: The line extends from the 241-AR-151 Diversion Box, north of the 244-AR Vault facility to the 241-AY-102 tank. It crosses under Buffalo Ave.
Related Sites/Structures: The pipeline is associated with the 241-AR-151 diversion box and the 241-AY-102 tank.

Code: 200-E-226-PL
Names: 200-E-226-PL; Promethium Transfer Line; Transfer Line from 221-B to 241-C-154; V743
Type: Direct Buried Tank Farm Pipeline
Status: Inactive
Classification: Accepted
Reclassification: None
Description: The waste site is an underground, 5 centimeter (2 inch) diameter stainless steel (promethium) transfer line.
Location: The pipeline extends from the south side of 221-B (Cell 8) to the Hot Semiworks 241-C-154 Diversion Box. The line crosses under Baltimore Ave. and turns south crossing under 7th Street. The line runs eastward paralleling the 200-E-111-PL pipeline, just north of 200-E-111-PL. The line crosses through the 209-E fence and terminates at the 241-C-154 Diversion Box.

Related Sites/Structures: The pipeline is associated with B Plant operations, Hot Semi Works operations and 241-C-154 Diversion Box.

Process Description: The pipeline transferred radioactive promethium solutions from 221-B to 201-C.

**Description:**
The waste site is an underground, 10 centimeter (4 inch) diameter, cast iron pipeline that fed the 216-A-37-1 crib through a distribution box. A 20 centimeter (8 inch) cement pipe extends from the 216-A-37-1 crib distribution box to the 216-A-30 crib distribution box. (see subsite 2).

**Location:**
The pipeline is located northeast of the PUREX facility. It extends from the 207-A Basins to the 216-A-37-1 distribution box.

**Related Sites/Structures:**
The pipeline is associated with the 216-A-37-1 and 216-A-30 crib distribution boxes.

**Description:**
This is a 20 centimeter (8 inch) diameter cement pipe.
Rev. 24
DOE/RL-88-30

Radioactive Process Sewer

Inactive

The waste site is an underground, 20 centimeter (8 inch) diameter cast iron pipeline that connected the 216-A-30 crib to the 216-A-37-2 crib distribution box.

The pipeline is located east of the 200 East Area fence, southeast of the PUREX facility.

Code: 200-E-234-PL
Names: 200-E-234-PL; Lines 300, 501, 505, and 557; Pipelines from 242-A Evaporator Building to the 207-A Basins
Type: Radioactive Process Sewer
Status: Inactive

The waste site is three underground, 10 centimeter (4 inch) diameter, carbon steel pipelines buried together in the same soil trench. They terminate at the 207-A pump pit. A fourth line (505) is a spare line that is stubbed off west of the 207-A basins (see subsite 2).

The pipelines extend eastward from the 242-A Evaporator Building to the 207-A Pump Pit. They are located north of 4th Street and cross under Canton Ave.

The pipelines are associated with the 242-A Evaporator building and the 207-A North and South Basins.

The lines transported secondary waste from the 242-A Evaporator to the 207-A Basins.

This Site has the Following SubSites:

Code: 200-E-234-PL:1
Names: 200-E-234-PL:1; Lines 300, 501, and 557 (alias DR-300)

Code: 200-E-234-PL:2
Names: 200-E-234-PL:2; Line 505 (Stub)

Type: Radioactive Process Sewer
Status: Inactive

The subsite is three, 10 centimeter (4 inch) diameter, carbon steel pipelines buried together in the same soil trench, terminating at the 207-A pump pit.

Line 300 (alias DR-300) is the effluent return line. It connects to tank 241-A-350, inside the 241-A Tank Farm.

The SubSite is Part Of:
| Code: 200-E-234-PL | Classification: Accepted |
| Names: 200-E-234-PL; Lines 300, 501, 505, and 557; Pipelines from 242-A Evaporator Building to the 207-A Basins |

| Description: | The subsite is a 10 centimeter (4 inch) diameter carbon steel spare pipeline. It is stubbed off west of the 207-A Retention Basins at the pump pit. |

| Code: 200-E-234-PL:2 | Classification: Accepted (Proposed) |
| Names: 200-E-234-PL:2; Line 505 (Stub) |
| Type: Radioactive Process Sewer |
| Status: Inactive |

| Description: | The subsite is a 10 centimeter (4 inch) diameter carbon steel spare pipeline. It is stubbed off west of the 207-A Retention Basins at the pump pit. |

| Code: 200-E-237-PL | Classification: Accepted |
| Names: 200-E-237-PL; 2904-E-24; Line 2904-E-1; Pipeline to 200 East Powerhouse Ditch and Pipeline from Powerhouse Ditch to 216-B-3 Ditches |
| Type: Process Sewer |
| Status: Active |

| Description: | The waste site is the 106 centimeter (42 inch) diameter reinforced concrete pipe and vitrified clay pipe that feeds the powerhouse ditch and the 76 centimeter (30 inch) diameter corrugated metal pipe that drained the powerhouse ditch to the B Pond system. The piping was later reused to feed the TEDF system. The mapped detail of this piping system includes the feeder pipes from the 284-E Powerhouse and the 282-E water reservoir. The 284-E Powerhouse has been demolished. |

| Location: | The pipeline is located north of 4th Street and south of 7th Street, east of Baltimore Ave. in 200 East Area. |

| Related Sites/Structures: | The pipeline is associated with the 200-E Power House ditch, 200-E-155-PL and the TEDF system pipeline (600-291-PL). |

| Process Description: | Drainage from the 282-E reservoir and the 284-E Powerhouse (now demolished) has been sent to the 200-E Powerhouse Ditch via the reinforced concrete portion of this pipeline. The powerhouse ditch is unlined and allows the effluent to percolate into the soil of the ditch. The ditch drainage was conveyed to the 216-B-3 ditches and ponds via the corrugated metal pipe at the distal of the powerhouse ditch. |

| A small diameter pipeline from 241-C tank farm joined the corrugated metal pipe (see 200-E-155-PL). 200-E-155-PL has now been isolated at the 241-C-03A pump pit. Later this effluent was diverted to the TEDF system by reusing the existing powerhouse ditch and piping. |
In 2010, discharge from 282E, 282EC and 283E continued to use this pipeline for relatively small amounts of discharge.

<td>Description: The waste site is an underground, 15 centimeter (6 inch) diameter stainless steel pipeline that connected the ASD Valve Pit and 295-A Sample Pit with the 216-A-36A and 216-A-36B cribs. When the 216-A-36A crib was extended to create the 216-A-36B crib, the distribution pipe was lengthened by inserting a 12 centimeter (5 inch) diameter pipe through the original 15 centimeter (6 inch) diameter crib pipe.</td>
<td></td>
</tr>
<tr>
<td>Location: The pipeline is located south of the PUREX facility.</td>
<td></td>
</tr>
<tr>
<td>Release Description: UPR-200-E-39 is described as a release that occurred on February 6, 1968. Pressurized ammonia scrubber liquid was found to be spewing from the vent filter at the 216-A-36B Crib Sampling Shack (295-A). The contaminated ammonia scrubber water erupted through the vent and filter and onto the ground around the outside of the sample shack. Approximately 60.4 square meters (650 square feet) of ground and blacktop was affected. Contamination levels ranged from 20 to 450 millirad/hour. The cause was determined to be that the export pressure was too high, resulting in back-pressure through the vent.</td>
<td></td>
</tr>
<tr>
<td>Process Description: The 216-A-36A portion of the crib was terminated in March 1966. The existing pipeline was extended to the 216-A-36B portion of the crib by inserting a 12 centimeter (5 inch) diameter pipe inside the existing 15 centimeter (6 inch) diameter distribution pipe. A 29 meter (95 foot) concrete dam was placed between the 216-A-36A and 216-A-36B crib sections.</td>

### 200-E-258-PL

**Classification:** Accepted  
**Reclassification:** None

**Type:** Radioactive Process Sewer  
**Status:** Inactive

**Description:** The waste site is an underground carbon steel pipeline that diverted effluent to the various sections of the 216-C-9 Pond. The majority of the piping system is constructed of 15 centimeter (6 inch) diameter carbon steel pipe.

**Location:** The pipeline runs east and west along the north side of 7th Street. Four distribution lines extend to various lobes of the 216-C-9 Pond.

**Related Sites/Structures:** The pipelines are associated with the 216-C-9 Pond.

**Process Description:** The 216-C-9 Pond (old 221-C facility excavation) was divided into sections with dikes. Piping was arranged to provide three discharge points, one to each section.

### 200-E-259-PL

**Classification:** Accepted  
**Reclassification:** None

**Type:** Radioactive Process Sewer  
**Status:** Inactive

**Description:** The waste site is an underground, 5 centimeter (2 inch) diameter carbon steel pipeline that fed the 216-C-9 Pond.

**Location:** The pipeline is located northeast of the demolished 201-C building. It extended north from the demolished 291-C Fan House to the 216-C-9 Pond. The pipeline crosses under 7th Street.

**Related Sites/Structures:** The pipeline is associated with the 291-C stack operation and the 216-C-9 Pond.

### 200-E-260-PL

**Classification:** Accepted  
**Reclassification:** None

**Type:** Radioactive Process Sewer  
**Status:** Inactive

**Description:** The waste site is an underground, 20 centimeter (8 inch) diameter carbon steel pipeline from PUREX to the 216-A-30 crib.

**Location:** The pipeline extends east from the PUREX facility, beyond the 200 East Area fence and terminates at the head end of the 216-A-30 crib.

**Process Description:**

The pipeline was used as a steam condensate bypass line.

**Related Sites/Structures:**

The pipeline is associated with PUREX and the 216-A-30 crib.

The waste site is an underground, 10 centimeter (4 inch) diameter cast iron pipeline. The pipeline returned contaminated effluent from the 216-A-42 Basin back to the PUREX facility.

The pipeline extends from the 216-A-42 basin, located south of 241-AP Tank Farm, to the 202-A (PUREX) facility.

The pipeline is associated with the 216-A-42 Basin and the 216-A-42A Pump Station.

**Location:** The 216-A-42 Basin is located south of the 241-AP Tank Farm. The pipelines and 216-A-42A Pump Station are on the west side of the 216-A-42 Basin.

The 216-A-42 Retention Basin was built to hold cooling water or steam condensate that was contaminated above standard release limits and prevent its disposal to the Gable and B Pond systems. After the retained effluent contents were analyzed, a built-in recovery system provided the capability of pumping solutions back into the PUREX facility for reprocessing (see sitecode 200-E-261-PL) or to cribs for disposal.
Description: The waste site is an underground, 20 centimeter (8 inch) diameter cast iron pipeline that connected the 216-A-42 Retention Basin to the 216-A-42C Diversion Box.

Location: The pipeline is located southeast of the 241-AP Tank Farm. The pipeline extends from the south end of the 216-A-42 Basin to the 216-A-42C Diversion Box.

Code: 200-E-264-PL
Names: 200-E-264-PL; Pipeline from 242-B Evaporator Building to 207-B Retention Basin
Type: Radioactive Process Sewer
Status: Inactive
Description: The waste site is an underground, 10 centimeter (4 inch) diameter cast iron pipeline that connected the 242-B Evaporator building to the 207-B Retention Basin.
Location: The pipeline is located east of Baltimore Ave. It extends south from the 242-B Evaporator building to the 207-B retention basin.
Release Description: UPR-200-E-79 describes a release that occurred in June 1953. Five leaks were discovered in the waste line that runs from 242-B to 207-B. Contamination levels up to 2,500 counts per minute were measured at the points of emission of water from the ground.
Related Sites/Structures: The pipeline is associated with 242-B Evaporator, 207-B Retention Basin and UPR-200-E-79.

This Site has the Following SubSites:
Name: 200-E-265-PL:1; Original Pipeline from 241-BY Tank Farm to the West Side of 207-B Retention Basin

Code: 200-E-265-PL
Names: 200-E-265-PL; 241-BY and 241-BX Tank Farm Cooling Water Pipeline to 207-B Retention Basin
Type: Radioactive Process Sewer
Status: Inactive
Description: The waste site is an underground, 10 centimeter (4 inch) diameter carbon steel pipeline that transferred In-Tank Solidification process cooling water to the 207-B Retention Basin. A new pipeline segment was added that by passed the retention basin and connected to the B Ditches.
Location: Portions of the pipeline are located inside the 241-B, BX and BY tank farms. It crosses under Baltimore Ave. One segment of the pipeline connects with the west side of the 207-B Retention Basin and one segment connects with the east side of the 207-B Retention Basin.
Related Sites/Structures: The pipeline is associated with the ITS process in 241-BY Tank Farm, the In Tank Solidification Systems (ITS 1 and ITS 2) and the 207-B Retention Basin.
Process Description: The pipeline carried cooling water from the In-Tank Solidification (ITS) process to the 207-B retention basin.

**Code:** 200-E-270-PL  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 200-E-270-PL; Line T022; Pipeline from 291-A Fan Control House to 216-A-26 and 216-A-26A French Drains  
**Type:** Radioactive Process Sewer  
**Start Date:**  
**End Date:**  
**Status:** Inactive  
**Description:** The waste site is an underground, 10 centimeter (4 inch) diameter stainless steel pipeline that fed the 216-A-26 and 216-A-26A French Drains.  
**Location:** The pipeline is located south of the 202-A building, southwest of the 291-A stack.  
**Related Sites/Structures:** The pipeline is associated with 216-A-26 and 216-A-26A french drains and 200-E-196-PL.  
**Process Description:** The effluent source to the 216-A-26 and 216-A-26A french drains was two floor drains located inside the 291-A Fan Control Building and the 291-A Fan Plenum. This effluent was originally discharged to 216-A-4 crib, but was rerouted to the french drains. The floor drains were plugged by filling with epoxy during the Purex deactivation. A new pipeline, from the 291-A Fan House to the french drains was installed.

Description: The waste site is an underground, 7.6 centimeter (3 inch) diameter carbon steel pipeline that connected the 216-A-40 basin to the 244-A Lift Station.

Location: The pipeline is located south of 7th Street and west of Buffalo Ave. It is south and east of the 244-A Lift Station.

Related Sites/Structures:

The pipeline is associated with the 216-A-40 basin and the 244-A Lift Station.

Process Description:

The 216-A-40 Basin was built to retain diverted contaminated water from 244-AR Vault. The basin was originally an open, rubber lined trench that was divided into 3 sections. A 0.3 meter (12 inch) diameter schedule 40 distribution pipe ran horizontally through the south end of the unit, 3.7 meters (12 feet) below grade. Collapsible rubber bladders (200,00 gallon capacity) were utilized to contain the contaminated cooling water and steam condensate. Contaminated cooling water and steam condensate from the 244-AR Vault were diverted to the 216-A-40 Retention Basin when the effluent was above standard release limits for the water to be sent to the 216-B-3 or 216-A-25 Ponds. The retention basin bladders failed in 1979 and the unit was removed from service. Although it was not being used, it remained an open basin until 1994. Contamination from inside the open basin affected the surrounding area via wind and animal related contamination migration.

200-E-274-PL (Line 323) was constructed when the 216-A-40 Retention Basin ended its operations in 1979. 200-E-274-PL (Line 323) was the primary line used to transfer waste from the pump pit to the 244-A Lift Station catch tank. During this construction the 200-E-274-PL was connected to the 244-A Lift Station catch tank using a jumper assembly connected to a valve extension.

The diverter was a two-compartment concrete structure with a motor driven diverter valve. Each bladder was equipped with a concrete sump and a 3 inch pipeline connected to the pump caisson (lines 321, 322 and 324). The pump caisson was connected to a pipeline (line 323 aka 216-E-274-PL) that routed contaminated water into the tank farm system, via the 244-A lift station.

In order to control the contamination migration from the basin, the 216-A-40 Retention Basin was stabilized in 1994. The retention basin pump, the diversion valve motor and other control devises were removed.
Description: The waste site is an underground, 30 centimeter (12 inch) diameter concrete cooling water pipeline that fed the 216-A-40 basin. The pipeline is associated with the 216-A-40 basin and the 244-AR Vault.

Location: The pipeline is located south of 7th Street and west of Buffalo Ave. It runs along the east side of the 216-A-40 Retention Basin.

Related Sites/Structures: The pipeline is associated with the 216-A-40 basin and the 244-AR Vault.

### Code: 200-E-276-PL

**Classification:** Accepted

**Reclassification:** None

**Names:** 200-E-276-PL; Pipeline from 296-A-13 Stack to 216-A-41 Crib

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** The waste site is an underground, 10 centimeter (4 inch) diameter vitrified clay pipeline that connected the 296-A-13 stack to the 216-A-41 crib.

**Location:** The pipeline is located west of Buffalo Ave. and north of the 244-AR Vault.

**Related Sites/Structures:** The pipeline is associated with the 216-A-41 crib.

**Process Description:** The pipeline carried stack drainage to the 216-A-41 crib.

---

### Code: 200-E-277-PL

**Classification:** Accepted

**Reclassification:** None

**Names:** 200-E-277-PL; Pipelines from 221-B and 221-BA to 216-B-59 and 216-B-59B Basins

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Start Date:**

**End Date:**

**Description:** The waste site is an underground pipeline that connected 221-B to the 216-B-59 Retention Basin. The majority of the pipeline is constructed of varied diameters of carbon steel pipe. The section of pipe that extends from the 221-BA sampling building to the head end of the basin is constructed of 38 centimeter (15 inch) diameter vitrified clay pipe. The by-pass line that connects to the center of the basin is constructed and the pipeline re-routing basin effluent to 241-B Tank farm are constructed of 5 centimeter (2 inch) diameter carbon steel. (see subsites)

**Location:** The pipeline extends from the south side of 221-B to 216-B-59 Retention Basin. It crosses under Baltimore Ave.

**Related Sites/Structures:** The pipeline is associated with B Plant operations and the 216-B-59 Retention Basin and pipeline 200-E-199-PL.

**Process Description:** In 1978, a new pipeline was added that connected the 216-B-59B basin to pipeline 200-E-199-PL, allowing effluent to be directed into the tank farm system.

| Type: Radioactive Process Sewer |
| Start Date: | End Date: |

Description: The waste site is an underground, 5 centimeter (2 inch) diameter stainless steel pipeline that carried waste from the 241-B-361 Settling Tank to the 216-B-5 Reverse Well.

Location: The pipeline is located on the east side of Baltimore Ave., northeast of the 241-B-361 Settling Tank.

Related Sites/Structures: The pipeline is associated with the 241-B-361 Settling Tank and the 216-B-5 Reverse Well.

| Code: 200-E-280 | Classification: Not Accepted (Proposed) | Reclassification: None |
| Names: 200-E-280; 2711-E Oil Spots; 2711E Parking Lot | Status: Inactive |
| Type: Unplanned Release |
| Start Date: | End Date: |
Description: The site is the parking lot for 2711E (200 East Garage/Automotive Shop). The site is suspected to be contaminated with oil that has dripped from vehicles awaiting maintenance and from a spill of used oil (see releases). Areas of oil-stained soil are scattered throughout the parking lot.

Location: The parking lot surrounds the 2711E facility. It is bounded on the east by Alabama Avenue, on the west by railroad tracks, and on the south by 4th Street. The northern edge of the parking lot is approximately 160 meters (525 feet) north of 4th street (estimated using aerial photography in QMAP). The entire area surrounding the 2711E facility was mapped as 200-E-280 because of the large area used to park vehicles.

Waste Type: Process Effluent

Waste Description: Areas of oil-stained soil are scattered throughout the parking lot.

---

### Code: 200-E-281-PL

**Classification:** Accepted

**Names:** 200-E-281-PL; Line V306; Pipeline from 241-B Tank Farm to 216-B-7A and 216-B-7B Cribs

**Type:** Radioactive Process Sewer

**Start Date:**

**End Date:**

**Description:** The waste site is an underground, 7.6 centimeter (3 inch) diameter stainless steel pipeline that connects the 241-B-202 and 241-B-202 tanks to the 216-B-7A and 216-B-7B cribs.

**Location:** The pipeline is located north of the 241-B Tank Farm.

**Related Sites/Structures:** The pipeline is associated with the 241-B-201 and 241-B-202 tanks and the 216-B-7A and B cribs.

---

### Code: 200-E-282-PL

**Classification:** Accepted

**Names:** 200-E-282-PL; Lines 4001, 4002, 4003 and 4004; Lines 4023 and 4028 connecting to encasement; Process Waste Lines from 202-A to 241-AX-151 Diversion Box

**Type:** Encased Tank Farm Pipeline

**Start Date:** 1/1/1965

**End Date:** 1/1/1974

**Description:** The concrete encased pipeline contains four, 7.6 centimeter (3 inch) diameter stainless steel pipelines. Line 4023 extends from the west end of 202-A and ties into line 4004 inside the encasement. Line 4028 extends from the south wall of 202-A and ties into line 4002 inside the encasement.

**Location:** The pipeline encasement originates on the south side of the PUREX facility. It extends westward beyond the facility footprint and turns north in between the double security fences no the west side of PUREX. The pipeline continues under 4th Street and angles east until it terminates at the 241-AX-151 Diversion Box, south of 244-AR Vault.

**Process Description:** The 200-E-282-PL waste site pipelines and encasement was constructed in 1965 as part of an improved Purex Essential Waste Routing System. This waste site consists of five pipelines that were utilized to transport approximately 15 billion gallons of PUREX self-boiling waste from the 202-A Plant to the 241-AX-151 Diversion Box. The pipelines were flushed with water after each waste transfer as was the established practice at the time. The final transfer of waste
through the pipelines was in 1974.

</tbody>
</table>

Code: 200-E-287
Names: 200-E-287; Posted Contamination Areas on Pipe Berm east of 241-A, AN, AX, AY and AZ Tank Farms
Type: Contamination Migration
Status: Unknown
Description: The waste site is a long, posted Soil Contamination Area located on the both sides of the gravel covered berm.
Location: The berm is located east of the 241-A Tank Farm Complex. It extends southeast from 241-AN Farm, crosses Canton Ave. and continues beyond the 200 East perimeter fence to the Verification Plant that is currently under construction.

Code: 200-E-288-PL
Names: 200-E-288-PL; PC-5000; Pipeline from 242-A Evaporator to Liquid Effluent Retention Facility
Type: Radioactive Process Sewer
Status: Active
Description: The waste site is an underground, fiberglass reinforced epoxy pipeline. It is a 7.6 centimeter (3 inch) pipe inside a 15.2 (6 inch) pipe.
Location: The pipeline extends from the north side of the 242-A Evaporator building to the Liquid Effluent Retention Facility fence.
Process Description: The PC-5000 pipeline carries process condensate waste from the 242-A Evaporator to the Liquid Effluent Retention Facility (LERF) basin 242AL-43. If radiation level exceed established limits, an alarm is received and interlocks divert the stream back to the condensate collection tank and the pump is shut off. This ensures that excessive radionuclides are not accidently transferred to LERF. Electronic leak detectors and swab risers are provided at 305 meter (1000 foot) intervals along the pipeline.
Waste Type: Soil
Waste Description: Process condensate from the 242-A Evaporator is a mixed waste stream. It is a dilute aqueous solution containing ammonia, volatile organics and trace quantities of radionuclide and inorganic constituents.

Code: 200-E-289-PL
Names: 200-E-289-PL; Lines 637, SN-700 and SN-701; Pipelines between AP-02D Pit and WTP
Type: Direct Buried Tank Farm Pipeline
Status: Inactive
Description: The waste site is three underground, stainless steel pipes (each encased in a carbon steel pipe).
Each line (637, SN-700 and SN-701) is a 7.6 centimeter (3 inch) pipe inside a 15.2 (6 inch) pipe.

**Location:** The pipelines extend from the east side of the 241-AP Tank Farm towards the Waste Treatment Plant (WTP).

**Related Sites/Structures:** The lines are associated with the 241-AP 02D pump pit and the WTP (future).

**Process Description:** These pipelines are currently capped outside the 241-AP Tank Farm. They will retain the inactive status until lines is connected to the Waste Treatment Plant (WTP) that is currently under construction. Line SN-700 and SN-701 extend from the 241-AP-02D pump pit and currently terminate near the west side of the WTP. Pipeline SN-637 extends from the east side of the 241-AZ Tank Farm and terminates near the west side of the WTP. These lines will later be tied into piping that connects to the WTP and will be utilized to support supplying waste to and receiving waste from the WTP.

**Waste Type:** Misc. Trash and Debris

**Waste Description:** In the future, the waste transferred through the pipelines will be Waste Treatment Plant feed and return effluent.

**Code:** 200-E-292  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 200-E-292; Area of Debris and Subsurface Anomalies on Unused Portion of 218-E-10 (aka 200-E-20)  
**Description:** The waste site is an area of interest (on 200-E-20) determined with Ground Penetrating Radar.  
**Location:** The debris area is located in the northern portion of WIDS sitecode 200-E-20. The area is approximately 39.6 X 10 meters (130 by 30 feet).  
**Related Sites/Structures:** The area is associated with 200-E-20.

**Code:** 200-E-293  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 200-E-293; 2718-E Contaminated Concrete Slab; 2718-E Foundation  
**Description:** The surface stabilized slab is associated with building 2718E, in 200 East Area. The metal building atop slab was demolished in November 2011 and the slab was left in place. The slab had a spot of radiological contamination. The contamination on the slab was covered with plastic, plywood and soil and posted as an Underground Radioactive Material Area. The cap covering the 209-E demolished building was expanded and now covers the 2718-E slab as well. Amended water was sprayed during the 209E building demolition activities. Post-demolition, three to six inches of surface material was removed from all areas affected by the amended water and prior to applying a gravel cap. The final gravel cap was expanded to cover all affected areas. The posted URMA was expanded to include the entire gravel cap. The gravel cap now covers several WIDS sites. The additional WIDS sites under the 209E gravel cap are 200-E-4, 200-E-35, 209-E-WS-1, 209-E-WS-2, 2718-E-WS-1 and 200-E-293 (2718E footprint). The 209-E-WS-3 (Tank 111), adjacent to the south side of the foundation, is within the URMA but was not covered or backfilled.  
**Location:** The waste site is inside the 209-E complex. It is located where the 2718-E building once stood.

**Code:** 200-E-294  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 200-E-294; 209-E Slab; Demolished 209-E Critical Mass Laboratory Building Foundation; Potential Asbestos in Soil  
**Description:** The 209-E building was demolished in December 2011. This waste site is the remaining concrete slab and any contaminated soil or piping beneath the slab under the demolished 209-E Critical Mass Laboratory building. The concrete slab was covered with gravel and posted with Underground Radioactive Material signs. The 209-E-WS-3 (Tank 111), adjacent to the south side of the foundation, was not covered or backfilled. Determination of potential asbestos
containing material (ACM) left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

Amended water was sprayed during the 209E building demolition activities. Post-demolition, three to six inches of surface material was removed from all areas affected by the amended water and prior to applying a gravel cap. The final gravel cap was expanded to cover all affected areas. The posted URMA was expanded to include the entire gravel cap. The gravel cap now covers several WIDS sites. The additional WIDS sites under the 209E gravel cap are 200-E-4, 200-E-35, 209-E-WS-1, 209-E-WS-2, 2718-E-WS-1 and 200-E-293 (2718E footprint). The 209-E-WS-3 (Tank 111), adjacent to the south side of the foundation, is within the URMA but was not covered or backfilled.

**Location:** The building foundation is located inside 200 East Area, south of 7th Street and east of Baltimore Ave.

</table>
Code: 2607-E13  
Names: 2607-E13; Septic Holding Tank South of 277-A  
Type: Septic Tank  
Status: Active  
Location: The septic holding tank is located on the west side of Buffalo Ave., south of the 277-A building.  
Related Sites/Structures: This tank services MO-398, MO-919 and MO-570 in 200 East Area.  
Process Description: The drain field failed in 1996 and was abandoned. The septic tank is currently used as a septic holding tank.

Code: 2607-EB  
Names: 2607-EB; 241-BY-254 (ITS #2) Sanitary Septic System  
Type: Septic Tank  
Status: Inactive  
Start Date: 1/1/1963  
End Date:  
Description: In 1991, the system was marked and roped. A site visit in 1997 (from outside the tank farm fence) could not identify the location of the system. The unit includes a drain field.  
Location: The septic system is located inside 241-BY, adjacent to the western 241-BY Tank Farm fence, west of 241-BY-112.  
Related Sites/Structures: Adjacent to the septic tank is a drain field composed of vitrified clay pipe, concrete pipe, or drain tile forming the main line and laterals from the tank.  
Process Description: The system received sanitary waste from the ITS #2 facility.  
Waste Type: Storage Tank  
Waste Description: Sanitary wastewater and sewage. Estimated rate of waste generation is 0.02 cu m/d.

Code: 2607-EF  
Names: 2607-EF; Septic Tank West of 241-BX Tank Farm  
Type: Septic Tank  
Status: Inactive  
Start Date:  
End Date:  
Description: The waste site is an underground septic tank.  
Location: The septic tank is located on the west side of the 241-BX Tank Farm, outside the fence.  
Process Description: The septic tank had serviced the 271 BXR Control House. The Control House building was located inside the tank farm fence.
Names: 2607-ES; Septic Tank and Dry Well North of 204-AR
Reclassification: None
Type: Septic Tank
Start Date:
Status: Active
End Date:
Location: The septic tank and dry well are located north of the 204-AR building.
Process Description: The septic tank serviced the 204-AR building. The attached dry well is located north of the septic tank.

Code: 241-ER-153
Names: 241-ER-153; 241-ER-153 Diversion Box
Reclassification: None
Type: Diversion Box
Start Date: 1/1/1945
Status: Inactive
End Date:
Description: Most of the diversion box structure is underground. The cover blocks with lifting bails are visible on the surface. The 244-A Lift Station is fenced, marked and radiologically posted.
Location: The 241-ER-153 Diversion Box is located south of Seventh Street, inside the fenced 244-A lift station.
Related Sites/Structures: The 241-ER-153 diversion box is associated with the 244-A Lift Station, 241-C Tank Farm, and the 241-ER-151, and 241-ER-152 Diversion Boxes and pipelines 200-E-145-PL and 200-E-147-PL.
Process Description: Diversion boxes contain jumper piping for routing liquid waste between facilities and the tank farms via underground transfer lines. They are concrete boxes that were designed to contain any waste that leaks from the high-level waste transfer line connections. The diversion boxes generally drain by gravity to nearby catch tanks where any spilled waste is stored. The 241-ER-153 Diversion box is a roughly rectangular reinforced concrete structure. The floors and lower portions of the walls are lined in stainless steel.
Waste Type: Process Effluent
Waste Description: The diversion box distributes waste between facilities and tank farms via underground transfer lines. Transfer lines V228, SN232 and SN233 are connected to 241-ER-153. Quantities are variable according to specific plant operations. This diversion box connects the 241-C Tank Farms to the double-shell tanks, and supports the 241-ER-151 Diversion Box in cross-site waste transfers. It is estimated that approximately 23 kilograms (50 pounds) of lead shielding may be stored in each diversion box.

Code: 241-EW-151
Names: 241-EW-151; 241-EW-151 Vent Station; 241-EW-151 Vent Station Catch Tank; 241-EW-151 Vent Station Catch Tank; 200 Area East-West Vent Station
Reclassification: None
Type: Catch Tank
Start Date: 1/1/1955
Status: Inactive
End Date: 1/1/2005
Description: The vent station is enclosed in a locked, chain link fence. It consists of an underground concrete structure containing a stainless steel tank in a vault with a jumper pit above the tank. The tank has two vent risers that extend above grade and a riser for the unit's leak detection.
system. At the bottom of the stairwell access is a floor drain that connects to a nearby french drain. Several hazard and radiological warning signs are posted on the fence. There are also two areas, outside the fence, adjacent to the northeast side of the vent station that are posted with Underground Radioactive Material signs.

**Location:** The site is located south of Route 3, approximately half way between 200 East and West Areas. It is south of the 609-A Fire Station.

**Related Sites/Structures:** This site is part of the cross-site waste transfer system and is associated with UPR-600-20, Diversion Boxes 241-UX-154 (200 West) and 241-ER-151 (200 East). The vent station is associated with the cross-site transfer line that runs between Diversion Boxes 241-UX-154 (200 West) and 241-ER-151 (200 East).

**Process Description:** The 241-EW-151 Vent Station is located at the high point of the cross site transfer line. The encasement slopes approximately 4 percent on each side of the vent station. The encased underground transfer line piping depth varies from 1.5 meters (5 feet) to 4.5 meters (15 feet). The vent station is designed to contain leaks from transfers and drainage from operations within the transfer system. The piping from the vent station drains to the diversion boxes. The vent station has a jumper pit to facilitate transfer of mixed waste between 200 East and 200 West Areas. The catch tank is part of the 241-EW-151 Vent Station. The catch tank vault used to drain to a nearby french drain, but that line has been isolated. The vent station stairwell floor drain still connects to the french drain. The catch tank has a capacity of 3,030 liters (800 gallons). It is 1.4 meters (4.5 feet) in diameter and 2.1 meters (7 feet) tall. Each of the cross site pipelines has a one inch stainless steel vent line connected to the 800 gallon vent station catch tank. A manually operated valve in each vent line allows for air bleeding, pressure checking and a siphon break on the drain back line. The 241-EW-151 Vent Station drains to a sump with a leak detection alarm that signals in the fire station building.

**Waste Type:** Process Effluent

**Waste Description:** The vent station transports waste solutions from processing and decontamination operations via the cross-site waste transfer system.

**Code:** 200-W-13

**Classification:** Accepted

**Reclassification:** None

**Names:** 200-W-13; 2713-WB Green Hut Complex; Regulated Vehicle Maintenance Shop Parking Areas

**Type:** Unplanned Release

**Start Date:**

**Status:** Inactive

**End Date:**

**Description:** The waste site is the areas of discolored soil (petroleum possibly) adjacent and near 2713-WB. Miscellaneous regulated equipment has been stored outside and north of 2713-WB in the past. Trash and debris are scattered around 2713-WB including vitrified clay pipe, wood, metal, glass, cloth, plastic, rubber, brick, and aerosol cans. There is a coated (pink) steam line on south side of 2713-WB indicating asbestos.

**Location:** The site is located within the 200 West Area, north of 19th Street. 2713-WB is approximately 100 meters west of Bridgeport Ave.

**Related Sites/Structures:** The site is related to the Minor Construction Area, Paint Shop, Shops, and the Power House.

**Process Description:** The site was used for regulated (i.e., containing radioactive material) vehicle maintenance and storage. In 1995, the north parking area and the area on the west side of the building were chained and posted with Contamination Area signs.

the filter structure, protruding through the top of the sand filter.

**Location:** The sand filter is located near the northeast corner of 221-T, adjacent to the 291-T stack.

**Related Sites/Structures:** The site is associated with the 291-T Stack and the 216-T-29 French Drain.

**Process Description:** The sand filter was used to filter the 291-T stack air. The sand filter is a partially buried concrete structure measuring 33.5 X 15.25 X 4.8 meters (110 X 50 X 16 feet). The 1987 Hanford Site Waste Management Units Report site description states "This site consists of sixty french drains, each measuring 6 inches in diameter, 3 foot 5 inches long, filled with coarse gravel, placed 13 feet 7 inches below the top of the structure. There is a concrete structure 100 X 48 X 14 feet 7 inches high which contains concrete blocks arranged in rows to form lateral ducts, with drains spaced throughout, every 10 feet lengthwise - 8 feet widthwise, all covered with 9 feet of sand and gravel, then covered with concrete slabs. There is a 1 foot layer of gravel on the entire bottom, with a layer of sisalkraft paper underneath which surrounds the drains throughout the structure." The 200 Area Waste Site Handbook (RHO-CD-673) describes the facility (sand filter) as "Sixty, 6 inch diameter vitrified soil pipes inside an area measuring 100 X 48 feet. The 291-T sand filter inlet trenches drain to a french drain pipe extending into the ground at the north corner of the sand filter. Any moisture condensed from the canyon air on the filter bed will escape to the ground at this location. The amount and activity are both very low."

<td>Accepted</td>
<td>Interim No Action (6/30/2004)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Type:** Unplanned Release

**Status:** Inactive

**Description:** The site has been evaluated and determined to require No Action. It is currently an area covered with gravel and posted as an Underground Radioactive Material Area. It originally had been surrounded with light post and chain and posted as a Contamination Area. The contaminated material was removed in June 2000.

**Location:** The site is located north of 23rd Street, east of the 218-W-2A Burial Ground. It is adjacent to the railroad track.

**Release Description:** The contaminated material was identified partly inside and partly outside of a previously posted Contamination Area on April 10, 2000. The posted area appeared to be very old and abandoned. The site consisted of contaminated wood and metal debris. The maximum direct contamination found on the metal was 12,000 disintegrations per minute. The area was properly reposted and logged into the Contamination Area logbook.

**Closure Info:** In June 2000, the scrap wood and angle iron were surveyed with field instruments. The metal that exhibited no detectable radiological contamination was recycled. Contaminated iron and scrap wood were processed as Low-level Waste (LLW). After the debris was removed the area was radiologically surveyed. No contamination was identified in the soil or vegetation. Six inches of gravel was spread over the area and the posting was changed from Contamination Area to Underground Radioactive Material. The reclassification to No Action is documented on form 2004-068.

**Names:** 200-W-78-PL; 6025; 7624 and 7630; Lines 6012;
Pipeline Between 241-TX/TY and 241-T Tank Farms

Type: Encased Tank Farm Pipeline  
Status: Inactive  
Start Date:  
End Date:  

Description: The site is an encased underground pipeline that runs between the 241-TXR-151 Diversion Box in the 241-TX Tank Farm and the 241-TR-153 Diversion Box in the 241-T Tank Farm. The encasement contains four lines (6012, 6025, 7624 and 7630). Outside the tank farm fence, the line is marked with Radioactive Pipeline signs. There are several stabilized, individually radiologically posted areas on top of (or adjacent to) this pipeline, near the east side of the 241-TY Tank Farm perimeter fence.

Location: The underground line is located in 200 West Area between the 241-T and 241-TX/TY Tank Farms, on the west side of Camden Avenue.

Related Sites/Structures: The line is associated with 241-T and 241-TX Tank Farms. UPR-200-W-167 was also located in the vicinity of this pipeline.

Process Description: The lines inside the tank farm fence are direct buried in a soil trench. The portion of the lines that are outside the tank farm fence are encased in cement. Lines 6012, 6025, 7624 and 7630 are inside this pipe trench and encasement. Lines 6025 and 7630 connect 241-TR-153 Diversion Box with 241-TXR-151 Diversion Box. Line 6012 connects the 241-T-101 salt well pump with 244-TX DCRT. Line 7624 connects the 241-T-111 salt well pump with 244-TX DCRT. The lines inside the tank farm are direct buried, stainless steel lines.

Code: 200-W-79-PL  
Classification: Accepted

Names: 200-W-79-PL; Line V663; Pipeline from 241-T-151 Diversion Box to 216-T-36 Crib  
Reclassification: None

Type: Radioactive Process Sewer  
Start Date: 1/1/1967  
End Date:  

Description: The site is a 10 centimeter (4 inch) diameter, vitrified clay underground pipeline that fed the 216-T-36 Crib. There were three separately posted Contamination Areas located on top of this pipeline, west of the 216-T-36 Crib. In November 2000, the Contamination Areas were stabilized and reposted as Underground Radioactive Material areas.

Location: The pipeline is located south of 23rd Street and west of Camden Avenue.

Related Sites/Structures: The site is associated with the 216-T-36 Crib, 241-T-151 Diversion Box and 200-W-130-PL.

Process Description: The 10 centimeter (4 inch) vitrified clay crib line is connected to the stainless steel "spare line V663" (see 200-W-130-PL). The spare line was activated in 1967 to feed the 216-T-36 crib. This pipeline carried waste that originated at both T-Plant and U-Plant via the 241-T-151 diversion box. The diversion box is located inside the 241-T tank farm.

Rev. 24

Inactive

The main waste site is a vitrified clay process sewer pipeline connecting T Plant buildings to the 207-T Retention Basin. The main line is a 61 centimeter (24 inch) diameter, underground vitrified clay pipeline extending from 221-T and 224-T to the 207-T Retention Basin. Feed lines from various support facilities are listed as subsites. There are multiple 1.2 meter (4 foot) diameter, yellow concrete manholes visible at intervals along the sewer line. This site also includes a radiologically posted area around one of the manholes located northwest of 216-T-6 crib. (see subsites)

The Process Sewer pipeline runs west from 221-T to the 207-T Retention Basin on the north side of 23rd Street.

The pipelines are associated with 221-T, 224-T, 2706-T and 207-T.

The Process Sewer lines transferred process cooling water, air conditioning condensate and floor drain waste from 221-T, 224-T and 2706-T to the 207-T Retention Basin. The retention basin released effluent to ditch that led to the 216-T-4-1 and 216-T-4-2 Ponds.

This Site has the Following SubSites:

**Description:**
The site is an underground, concrete encased pipeline. The surface is marked with Underground Radioactive Material - Pipeline signs. Yellow swab risers are located along the pipeline. One swab riser, near the 204-S facility, has been surrounded with posts and chain and posted with Soil Contamination Area signs.

**Location:**
The pipeline extends northwest from the REDOX facility to the 241-S/SX Tank Farm.

**Related Sites/Structures:**
The site is associated with 202-S, 203-S, 204-S and 205-S and the 241-S-151 Diversion Box.

**Process Description:**
The encased 7.6 centimeter (3 inch) diameter pipelines transferred waste from the REDOX facility to the 241-S-151 Diversion Box at the 241-S/SX Tank Farm.

**Waste Type:**
Steam Condensate

**Waste Description:**
The pipeline transferred REDOX process waste to the 241-S/SX Tank Farm.

**Description:** Radioactive Material - Pipeline signs.

**Location:** The pipeline is located south of 16th Street, extending in a southeast direction from the 241-U-153 Diversion Box to 204-S and the REDOX facility.

**Related Sites/Structures:** The site is associated with the 204-S Facility and the 241-U-153 Diversion Box. Pipeline 200-W-138-PL exits and connects to 216-S-7 crib.

**Process Description:** The pipeline transferred waste between the 241-U-153 Diversion Box (located inside the 241-U Tank Farm) and the 204-S facility. There are three, 7.6 centimeter (3 inch diameter) carbon steel lines inside the concrete encasement.

**Waste Type:** Chemicals

**Code:** 200-W-99-PL

**Names:** 200-W-99-PL; Encased Pipeline from 241-U-151 to 241-S-151 Diversion Boxes; Lines V455 and V456

**Type:** Encased Tank Farm Pipeline

**Status:** Inactive

**Classification:** Accepted

**Type:** Encased Tank Farm Pipeline

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** None

**Start Date:**

**End Date:**

**Description:** The site is an underground cement encased pipeline. The encasement contains three stainless steel lines. The pipeline encasement is marked with Underground Radioactive Material - Pipeline signs.

**Location:** The pipeline begins on the east side of the 221-U building at the 241-UX-154 Diversion Box and extends in a southwest direction to terminate at the 241-SX-152 Diversion Box, located on the east side of 241-S/SX Tank Farm.
**Process Description:**
The pipelines transferred U Plant canyon waste to the 241-S/SX Tank Farm from the 241-UX-154 diversion box (via a segment within the 200-W-105-PL encasement). The 7.6 centimeter (3 inch) diameter stainless steel lines include lines V762/4853, V503/4700 and V505/4701.

**Waste Type:** Soil

**Waste Description:**
The pipeline transferred U Plant canyon waste to the 241-S/SX Tank Farm via the 241-UX-154 diversion box.

**Type:** Encased Tank Farm Pipeline

**Status:** Inactive

**Description:**
The site is an underground pipeline cement encasement. The encasement is marked with Underground Radioactive Material - Pipeline signs.

**Location:**
The pipeline concrete encasement begins at 241-UX-154, on the east side of the 221-U building. It extends east and separates into two segments near the 241-WR Vault. One segment, containing seven lines, extends north and northwest to terminate at the 241-TX-155 Diversion Box.

**Related Sites/Structures:**
The encasement includes tank farm lines V375, V382, 4859/4703, 4878, 4832, 4876, 4897, 4707, 4701, 4700, 4855, 4854 and 4853. The pipeline is associated with 221-U, 241-UX-154 Diversion Box, 241-WR Vault, 241-TX-155 diversion box.

**Process Description:**
The encased pipeline transferred U Plant canyon waste to the 241-TX Tank Farm via the 241-UX-154 diversion box, the 241-TX-155 diversion box and pipeline 200-W-191-PL. It also supported the Uranium Recovery product and waste transfers via the 241-WR Vault.

The pipeline separates into two segments near the south side of the 241-WR Vault. Five lines from the 241-UX-154 Diversion Box extend beyond the "Y" split to connect to the 241-WR Vault. Beyond the "Y", seven lines (from the upper nozzles of the 241-UX-154 DB) divert to the 241-TX-155 Diversion Box. The line numbers continuing to 241-TX-155 Diversion Box are V375, V376, V382, 4851, 4877 and 4859/4703.

The width of the concrete encasement changes several times to accommodate piping being added and subtracted from the group of pipes. It begins as 300 feet of 9 line (80 inch wide) encasement at the 241-UX-154 Diversion Box. It expands to 200 feet of 12 line (101 inch wide) encasement near the 241-WR Vault. A 7 line (66 inch wide) segment splits near the WR Vault that extends to the 241-TX-155 diversion box.
Beyond the "Y" shaped split, five lines (from the lower nozzles of the 241-UX-154 DB) connect to the 241-WR Vault. Several other Uranium Recovery process lines join the encasement on this side of the split. Some lines feed into the WR vault and others remove product and waste out of the WR Vault. The line numbers that are part of this segment of 200-W-105-PL include 4878, 4832, 4876, 4897, 4702, 4703, 4707, 4701, 4700, 4855, 4854 and 4853. Some of the process lines were installed, but never used. Some lines pass through the 241-UX-154 Diversion box and connect to section 11, 12 and 13 of the 221-U process building. Some lines were rerouted in 1970 to support the Redox Supernate Transfer System (per H-2-35865).

Waste Type: Soil

Waste Description: The pipeline transferred waste to the 241-TX Tank Farm.

*Hanford Site Waste Management Units Report*

February 2015
Reclassification: 200-W-126; Tank Farm Vertical Storage Units; Vertical Storage Units West of 241-T Tank Farm

Name: Storage

Status: Inactive

Description: The site consists of six vertical storage units. The units were constructed of steel pipes approximately 0.3 meters (1 foot) in diameter and 2 meters (6 feet) deep. They extend approximately 0.1 meters (4 inches) above the ground surface.

Location: The six storage units are located near the outside of the 241-T Tank Farm fence. They are approximately 10 meters (30 feet) west of the tank farm and north of 23rd Street. They are located within a large Underground Radioactive Material area that includes the 216-T-7 tile field and the 216-T-5 crib.

Related Sites/Structures: The units are associated with the 241-T Tank Farm.

Process Description: The Vertical Storage Units (VSU) were used to store dry, radiologically contaminated tank farm equipment, like shield plugs and slurry distributor handles or contaminated soil. The units are currently empty and have been capped.

Waste Type: Steam Condensate

Waste Description: The units were used to store radioactively contaminated pieces of equipment like shield plugs and distributor handles.

Reclassification: 200-W-127; Surface Stabilized Area East of UPR-200-W-29/UPR-200-W-97 (UN-216-W-5)

Unplanned Release

Status: Inactive

Description: The site is a posted Underground Radioactive Material area that has been covered with gravel.

Location: The site is located on the south side of 23rd Street in 200 West Area. It is west of T Plant and east of UPR-200-W-29/UPR-200-W-97, a posted Underground Radioactive Material area on the corner of 23rd St. and Camden Ave.

Related Sites/Structures: Encased pipeline 200-W-129-PL crosses this radiologically posted area.

Reclassification: 200-W-128; Underground Radioactive Material Area East of 218-W-4A

Unplanned Release

Status: Inactive

Description: The site is posted with Underground Radioactive Material signs. A considerable amount of sand appears to have blown onto the posted area.
**Location:** The site is located approximately 100 feet south of 23rd Street, inside 200 West Area. It is adjacent to the 218-W-4A fence.

**Related Sites/Structures:** The area is associated with the 218-W-4A burial ground.

<td>The site is an underground cement encasement containing three carbon steel pipelines. The encasement is marked and posted with Underground Radioactive Material and Pipeline signs.</td>
</tr>
<tr>
<td>200-W-130-PL</td>
<td>Accepted</td>
<td>The site is a soil trench that contains multiple stainless steel pipelines exiting the 241-T-151 and 241-T-152 diversion boxes. Each line is 7.6 centimeters (3 inches) in diameter. Three lines (V445, V663, V662) extend south from the 241-T-151 diversion box. Three other lines (V601, V682 V683) extend south from 241-T-152 diversion box. One line from each diversion box (V445 and V601) merge together south of 241-T tank farm, south of 23rd Street and continue to 241-U-152 diversion box. The lines are encased in concrete only where they pass under 23rd Street. Line V663 was activated to feed the 216-T-36 crib and ties into 200-W-79-PL. The remaining lines (V662, V682 and V683) were not activated and are considered Spare lines.</td>
</tr>
</tbody>
</table>
Process Description: Lines V445, V662 and V663 exit the 241-T-151. Lines V662 and V663 exit 241-T-151 diversion box in the same trench as V445. V662 and V663 were originally spare lines that were cut and capped south of the diversion box, outside the tank farm fence. Line V663 was reactivated in 1967 to connected to the 216-T-36 crib (see sitecode 200-W-79-PL). V445 continues south to 241-U-151. Lines V601, V682 and V683 exit 241-T-152 diversion box. V682 and V683 were spare lines that were cut and capped south of 241-T tank farm, outside the tank farm fence. Line V601 merges with line V445 south of 241-T Tank Farm and shares the same trench until V601 diverts to 241-TX tank farm. Line V416 enters the soil trench from 241-TX tank farm at the point where V601 leaves the trench. South of 241-TX tank farm, line V445 shares the same trench with line V416 until they connect to 241-U-152 diversion box.

Code: 200-W-131-PL  Classification: Accepted
Names: 200-W-131-PL; Line V601; Spur from 241-T-152 to 241-TX-153 and 241-U-151  Reclassification: None
Type: Direct Buried Tank Farm Pipeline  Start Date: 8/30/1950
Status: Inactive  End Date: 
Description: The waste site is a 7.6 centimeter (3 inch) diameter, stainless steel pipeline in a soil trench that originally transferred waste from 241-T farm to 241-U farm. In 1950, a tee was made to redirect effluent to 241-TX Tank Farm.

Location: The majority of this pipeline is located east of Camden Ave. It connected the 241-T-152 Diversion Box, located inside 241-T Tank Farm, to the 241-U-151 Diversion Box, located east of 241-U Tank Farm. In 1950, a tee was made to redirect effluent to 241-TX Tank Farm.

Related Sites/Structures: The site is associated with WIDS site 200-W-130-PL, 241-T-152, 241-T Tank Farm, 241-TX Tank Farm, 241-TX-153 and 241-U Tank Farm.

Process Description: Line V601 originally connected 241-T-152 and 241-U-151. Line V601 was cut in 1950 and rerouted to 241-TX Tank Farm with an east/west pipe spur and a tee connection to 241-TX-153 diversion box. The north portion of the pipeline connected 241-T Tank Farm with 241-TX Tank Farm. The southern portion of the pipeline connected 241-U Tank Farm with 241-TX Tank Farm.

Code: 200-W-132-PL  Classification: Accepted
Names: 200-W-132-PL; Pipelines from 221-T to 241-T-151 and 241-T-152; V653, V654, V667, V668, V669, V706, and V707  Reclassification: None
Type: Direct Buried Tank Farm Pipeline  Start Date: 1/1/1945
Status: Inactive  End Date: 
Description: Seven, 7.6 centimeter (3 inch) diameter, pipelines are contained in the same soil trench. Three lines - V653, V654 and V706 are 7.6 centimeter (3 inch) diameter stainless steel lines. Four lines - V667, V668, V669 and V707 are 7.6 centimeter (3 inch) diameter carbon steel line. The group of pipelines is marked with Underground Radioactive Material and Pipeline signs.

Location: The bundle of pipelines begins at 221-T and terminates at the 241-T-151 Diversion Box in the 241-T Tank Farm.
Process Description: The pipelines transported T Plant waste to the 241-T-151 and 241-T-152 diversion boxes, inside 241-T Tank Farm. Some of the lines are stainless steel and others are carbon steel.

- Line V653 is a 3 inch diameter stainless steel line from section 10 of 221-T.
- Line V654 is a 3 inch diameter stainless steel line from section 9 of 221-T.
- Line V667 is a 3 inch diameter carbon steel line from section 5 of 221-T.
- Line V668 is a 3 inch diameter carbon steel line from section 15 of 221-T.
- Line V669 is a 3 inch diameter carbon steel line from section 15 of 221-T.
- Line V706 is a 3 inch diameter stainless steel line from 224-T. (re-routed from 216-T-3 reverse well in late 1946 - see 200-W-226-PL)
- Line V707 is a 3 inch diameter carbon steel line from section 10 of 221-T.

Code: 200-W-136 Classification: Accepted
Names: 200-W-136; Demolished 224-U, 224-UA, 203-U, 203-UX, 222-U; Posted Underground Radioactive Material Area; Potential Asbestos in Soil
Reclassification: None
Type: Post Demolition Remediation Area
Start Date: 1/1/1947
End Date: 1/1/2005
Status: Inactive

Description: The waste site was originally an irregular shaped gravel area, posted with Underground Radioactive Material Area (URMA) signs, created after the demolition of the 222-U building. In 2011, the URMA boundary was greatly expanded. It was extended up to the back side of 221-U. The expansion eliminated the need for a separate radiological posting for the UPR-200-W-162 waste site. The posted area also includes the demolished 224-U and 224-UA building footprints. The remnants of the demolished 203U, 203UX and the 272-U Hot Shop are also beneath the URMA gravel cover. The expanded area also includes 241-UX-154, UPR-200-W-162 and 291-U and the Sand Filter.

The determination of potential asbestos containing material (ACM) left in place and abated during demolition of 224-U, 224-UA and 203-UX is based on a Quality Assurance review of project documentation and interviews with activity personnel.

Location: The site is located southeast of the 221-U canyon building, north of 16th St and west of Beloit Ave.

Process Description: 221-U was built in 1945 as a Bismuth Phosphate Separation Facility. The Bismuth Phosphate process separated only the plutonium from the dissolved irradiated fuel rods. All the uranium and fission products were transferred to the tank farm storage tanks. U Plant was the same design as B Plant and T Plant. This design included installing seven, 3 inch stainless steel (direct buried) lines from 221-U to 241-U-151 diversion Box (see H-2-800 and H-2-804). After the B and T plants began to operate, it was decided that U Plant would not be needed for its original purpose. From 1945 until 1952, it was used as training facility for workers assigned to the B and T Plants. In 1952, the 221-U facility was reconfigured to operate the Uranium Metal Recovery (tributyl phosphate) process. The majority of the original seven transfer lines connected to 241-U-151 were removed, although remnants of the lines may still remain near the diversion box and behind 221-U. The process recovered uranium from the waste stored in the tank farms that had been generated from the bismuth phosphate separation process at B and T.

The 222-U building supported the 221-U canyon as a Sample Preparation Laboratory. The function of the laboratory was to test the 221-U process solutions at various stages to verify the process was working within the process specifications. The 203-U tanks were associated with the 224-U and 224-UA facility Uranium Tri-Oxide process. The 203 tanks consisted of a concrete enclosure containing two 375,000 liter (100,000 gallon) uranyl nitrate feed tanks.

</tbody>
</table>
Inactive  Status:  End Date:

Description:  The waste site is a 3-inch stainless steel underground pipeline to the 216-S-9 crib. When the 216-S-9 crib was built to replace the 216-S-7 crib, the pipeline (200-W-138-PL) was extended to tie into the 216-S-9 crib. Line V547 emerges from an encased pipeline (200-W-98-PL).

Location:  The pipeline is located northwest of the 202-S facility.

Release Description:  UPR-200-W-108 occurred on January 8, 1969, during the tie-in that diverted waste to the 216-S-23 crib.

UPR-200-W-109 occurred on January 24, 1969. UPR-200-W-109 states that after repairing the buckled portions of the waste line near the 216-S-9 crib, a pressure test indicated another leak in the line. Additional hydrostatic testing finally forced the water to bubble to the surface. It surfaced inside the radiation zone marking the 218-W-9 burial trench. Dose rates of the liquid were 450 mR/hr, but as the water sank back into the soil, the dose rate dropped to 20 mR/hr. Excavation of the liquid bubble site disclosed a vertical buckle in the pipeline with a sizable break in the line at that point. (RHO-CD-673)

Process Description:  When the 216-S-9 crib was built to replace the 216-S-7 crib, the extended pipeline was tied into the 216-S-7 pipeline (see 200-W-138-PL). Line V547 emerges from an encased pipeline (200-W-98-PL).

Code:  200-W-140-PL  Classification:  Accepted
Names:  200-W-140-PL; Pipeline from 292-T (200-W-40) to 216-T-8 Crib via 200-W-142-PL
Reclassification:  None
Type:  Radioactive Process Sewer  Start Date:
Status:  Inactive  End Date:
Description:  The waste site is an underground pipeline from the 216-S-9 crib to the 216-S-8 crib via the 216-T-8 crib. The pipeline is 8.9 centimeters (3.5 inches) in diameter and is stainless steel. The waste line from 292-T connects to the pipeline to the 216-T-8 crib (see 200-W-142-PL).
Location:  The pipeline is located east of the 221-T building.

Related Sites/Structures:  The pipeline is associated with the 292-T building (sitecode 200-W-40), the 200-W-142-PL pipeline and 216-T-8 crib.

Process Description:  The original 292-T building (21 feet by 16 feet) housed the 291-T stack gas sampling system.
**Process Description:** When the 216-S-23 crib was built to replace the 216-S-9 crib, the 216-S-23 pipeline was tied into the 216-S-9 pipeline (see 200-W-139-PL). The 216-S-9, 7.6 centimeter (3 inch) diameter, stainless steel pipeline was cut, teed and converted to a 15.2 (6 inch) diameter concrete lined iron pipe with flanges for the 216-S-23 crib waste. Line V547 extends from the encased pipeline (200-W-98-PL).

**Related Sites/Structures:** The site is associated with UPR-200-W-108, 240-S-151 diversion box, 200-W-98-PL, 216-S-9 crib, 216-S-23 crib and 200-W-139-PL pipeline.

**Release Description:** UPR-200-W-108 states that on January 8, 1969, during the tie-in of the 216-S-9 Crib waste line to the new 216-S-23 Crib, contaminated water was encountered coming from a break at the junction of the two crib lines. Further excavation disclosed a severe expansion buckle in the line at that point, and a similar buckle in the line near the 202-S Building. There is no way of determining how long the line had been leaking or how much waste was discharged to the ground.

**Process Description:** When the 216-S-23 crib was built to replace the 216-S-9 crib, the 216-S-23 pipeline was tied into the 216-S-9 pipeline (see 200-W-139-PL). The 216-S-9, 7.6 centimeter (3 inch) diameter, stainless steel pipeline was cut, teed and converted to a 15.2 (6 inch) diameter concrete lined iron pipe with flanges for the 216-S-23 crib waste. Line V547 extends from the encased pipeline (200-W-98-PL).

**Code:** 200-W-142-PL  
**Names:** 200-W-142-PL; Pipeline from 222-T to 216-T-8 Crib  
**Type:** Radioactive Process Sewer  
**Status:** Inactive  
**Description:** The site is an underground, 8.9 centimeter (3.5 inch) diameter, stainless steel pipeline.  
**Location:** The pipeline extends southward from the 222-T building.

**Related Sites/Structures:** The pipeline is associated with the 222-T building and 292-T (sitecodes 200-W-40 and 200-W-140-PL).

**Process Description:** 222-T laboratory waste was sent to the 216-T-8 crib via this pipeline. In 1949, the effluent line from 292-T (sitecode 200-W-140-PL) was also connected to this crib pipeline.

**Code:** 200-W-143-PL  
**Names:** 200-W-143-PL; Encased Pipeline from 241-TX-154 Diversion Box to 241-TX-152 and 241-TX-155 Diversion Boxes; Lines V383, V384, V385, V387, V388, V391, V392, and V393  
**Type:** Encased Tank Farm Pipeline  
**Status:** Inactive  
**Description:** The waste site is an underground, concrete encased pipeline. The pipelines inside the encasement are 9 centimeter (3.5 inch) diameter stainless steel lines. The majority of the encasement contains seven stainless steel pipelines (V383, V384, V385, V387, V388, V391, V392). There is a section of nine stainless steel lines near the 241-TX-154 Diversion Box. This section contains the seven lines (mentioned above) and two, short stub lines - V728 and V729. The section of pipeline near the 241-TX-155 Diversion Box contains ten lines. This section contains the seven main lines (mentioned above), an extra line from the 241-TX-302B catch tank (V393) and two short stub lines (V390 and V386).  
**Location:** The encased pipeline begins at the 241-TX-154 Diversion Box. It runs diagonally south of 23rd Street and terminates at the 241-TX-155 Diversion Box.
Related Sites/Structures: The site is associated with the 221-T facility operations, the 241-TX-154 diversion box and the 241-TX-152 and 241-TX-155 Diversion Boxes.

<td>The pipeline is a 10 centimeter (4 inch) diameter, vitrified clay pipe. The pipeline extends from the 293-S building to the 216-S-22 crib. The piping in the 293-S Building was blanked in 1967. It is located east of the 202-S (REDOX) building. The pipeline is associated with the 216-S-22 crib. The site provided subsurface liquid disposal for the 293-S Building waste. The crib is a gravel structure with a side slope of 1:1.5. A pipe enters the unit below grade, branches out at right angles downwards to the bottom, and runs along the bottom for the length of the unit. The section of pipe along the crib bottom has open joints. The rest of structure is filled with backfill.</td>

<td></td>
<td></td>
<td>Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site (200-W-147-PL) has been split into segments. It was an underground 20 centimeter (8 inch) diameter vitrified clay pipe, extending from the 207-SL retention basin to the 216-S-19 pond. 200-W-147-PL-B is the portion of pipeline that extends from the 207-SL basin to the Outer Area boundary. This portion of pipeline is located east of the 222-S laboratory facility, inside 200 West Area, in the Inner Area. It extends from the 207-SL basin to the Inner/Outer Area boundary. This portion of pipeline is associated with the 207-SL basin, 216-S-19 Pond, 216-S-26 crib and 200-W-147-PL-A. The pipeline carried waste from the 222-S and 202-S facilities to the 216-S-19 Pond and 216-S-26 crib via the 207-SL Retention Basin.</td>
</tr>
</tbody>
</table>
There are three source facilities that fed the 216-S-20 crib. Each source had separate pipelines to the crib. Two, side by side, 9 centimeter (3.5 inch) diameter stainless steel lines extends from 219-S to the 216-S-20 Crib. One 20 centimeter (8 inch) diameter, carbon steel line extends from the 207-SL Retention Basin valve pit to the 216-S-20 Crib. Another 15 centimeter (6 inch) diameter carbon steel pipeline extends from the truck unloading station to the 216-S-20 crib. (see subsites)

The 216-S-20 crib and associated pipelines are located northeast of the 222-S laboratory and 207-SL Retention Basin.

The 216-S-20 crib effluent was associated with the 219-S building, the 207-SL Retention Basin and the lab waste truck unloading station.

The 216-S-20 crib received waste from lab hoods and decontamination sinks in the 222-S building via the 219-S Retention Building and the 207-SL Retention Basin. It also received 300 Area laboratory waste via trucks, unloaded into the manhole at the adjacent waste unloading station.

<td></td>
<td></td>
</tr>
</tbody>
</table>

Type: Radioactive Process Sewer
Status: Inactive

Description: The piece of pipeline remaining under 16th Street is not visible, nor is it marked with a sign.

Location: The pipe is located southeast of the demolished 224-UA building, beneath the 16th Street asphalt.

Related Sites/Structures: The site is associated with the 221-U and 224-U facilities, 270-W tank and the pipeline that fed 216-U-8 and 216-U-12 cribs (see sitecode 200-W-42-PL) and the encased tank farm line 200-W-100-PL.

Process Description: WIDS sitecode 200-W-42 (alias 200-W-42-PL) is the underground vitrified clay pipeline transferred process condensate from the 221-U and 224-U Buildings and the 291-U Stack, through the 270-W neutralization tank to the 216-U-8 and 216-U-12 Cribs.

Waste Type: Steam Condensate

Waste Description: From 1952 to 1960, the line transferred waste from 221-U, 224-U and 291-U to the 216-U-8 crib. The 216-U-12 crib replaced the 216-U-8 crib in 1960. The pipeline was extended further south to the 216-U-12 location. From April 1960 to May 1967, the pipeline received waste from the 291-U-1 Stack drainage, 241-WR Vault waste, and 224-U process condensate via C-5 Tank. Disposal of contaminated water from 241-WR Vault was accomplished in October 1965 and included 3.14 kilograms (6.9 pounds) of thorium. From May 1967 to September 1972, the site received the above wastes excluding the 241-WR Vault waste and occasional waste via the C-7 Tank in the 244-U Building. From September 1972 to November 1981, the site was taken
out of service. After November 1981, the pipeline received process condensate (corrosive: typical pH range is 0.5-1.5) from the 224-U Building. In the past, this facility also received miscellaneous storm drain wastes from 224-U. A Limited Field Investigation was done in 1994 to characterize selected waste sites in the 200-UP-2 Operable Unit. Fourteen surface and subsurface soil samples along with four vegetation samples were collected to characterize the vitrified clay pipeline (VCP) leading to the 216-U-8 Crib. An attempt was made to determine if the contamination had spread laterally from the pipeline by digging holes with an auger rig where subsurface contamination had been identified. An increase in activity was noted at approximately 3 meters (10 feet). At a depth of 3.3 meters (11 feet) the auger was stopped by large cobbles. The samples were analyzed for cesium-137, strontium-90, gross alpha and gross beta. Specific sample data is documented in BHI-00033.

**Description:** A 30 centimeter (12 inch) diameter steel pipeline that exits the south side of the Control Structure and connects to the 61 centimeter (24 inch) VCP line (sitecode 200-W-152-PL).

**Process Description:** This segment allowed effluent to be sent to 216-S-17 Pond. 216-S-17 Pond was deactivated in 1954.

**The SubSite is Part Of:**

**Code:** 200-W-153-PL
**Names:** 200-W-153-PL; Steel Pipeline from 240-S-151 Diversion Box to the 2904-S-172 and 2904-S-171 Control Structures via 200-W-212-PL

**Code:** 200-W-154-PL
**Names:** 200-W-154-PL; Pipeline from 200-W-152-PL to 216-S-5 Crib

**Description:** The waste site is an underground 61 centimeter (24 inch) diameter vitrified clay pipeline that feeds the 216-S-5 crib. The pipeline connects to the 200-W-152-PL.

**Location:** The pipeline is located outside the 200 West Area perimeter fence, southwest of 207-S.
Process Description: The 216-S-5 crib was built as a replacement for the grossly contaminated 216-S-17 pond. The 216-S-5 crib received the process vessel cooling water and steam condensate from the 202-S (REDOX) building.

Related Sites/Structures: The site is associated with the REDOX cooling water effluent stream (202-S Redox Building) and the 200-W-152-PL pipeline and the 216-S-5 Crib.

Code: 200-W-155-PL-A
Names: 200-W-155-PL-A; Portion of 200-W-155-PL Pipeline in the Outer Area
Type: Radioactive Process Sewer
Status: Inactive
Start Date: Classification: Accepted
End Date: Reclassification: None

Description: Due to the restructuring of Operable Units, as described in the Agreement for Central Plateau Cleanup, the original pipeline site (200-W-155-PL) has been split into segments (200-W-155-PL-A and 200-W-155-PL-B). The original pipeline was an underground 61 centimeter (24 inch) diameter vitrified clay pipe. It extends from the 2904-S-160 Control Structure to the head end of the 216-S-16 Ditch. 200-W-155-PL-A is the portion of the pipeline that is located in the Central Plateau Outer Area.

Location: This portion of pipeline extends from the Inner/Outer Area boundary to the head end of the 216-S-16 Ditch.

Related Sites/Structures: The waste site is associated with the 216-S-16 ditch and the 200-W-155-PL-B pipeline.

Process Description: In 1954, the original 61 centimeter (24 inch) process sewer line (sitecode 200-W-152-PL) was plugged and the flow to the 216-S-17 Pond was abandoned. The effluent was directed to the 216-S-6 crib and later to the 216-S-16 Pond via the 2904-S-160 Control Structure. Flow could be directed to 216-S-6 crib at Manhole 8 via pipeline 200-W-156-PL or to the 216-S-16 Ditch and Pond via pipeline 200-W-155-PL-A and B.

Code: 200-W-155-PL-B

**Code:** 200-W-157-PL  
**Classification:** Accepted  
**Reclassification:** None

**Names:** 200-W-157-PL; Pipeline from 202-S to 200-W-152-PL and 216-S-10 Ditch; Pipeline from 205-S to REDOX Chemical Sewer; REDOX Chemical Sewer

**Type:** Process Sewer  
**Start Date:**  
**End Date:**  
**Status:** Inactive

**Description:** The site is a system of underground vitrified clay pipeline with diameters of 20 centimeters (8 inch) and 30 centimeters (12 inch). A 10 centimeter (4 inch) diameter vitrified clay pipe extends from the 205-S building to the main chemical sewer line.

**Location:** The pipeline attaches to manholes located on the north side of 202-S, the south side of 271-S, the south side of 211-S and south of the 205-S building. The chemical sewer extends beyond the 200 West Area fence, southwest of 202-S.

**Related Sites/Structures:** The waste site is associated with the 216-S-10 ditch and pond and the REDOX process sewer (sitecode 200-W-152-PL).

**Process Description:** The REDOX chemical sewer connected to manhole number 3, southwest of 202-S. It connected to the 216-S-10 ditch at Manhole number 2. A segment of the chemical sewer continued to Manhole number 1, where it tied into the distal end of the Process Sewer line (sitecode 200-W-157-PL).
This Site has the Following SubSites:

**Code:** 200-W-157-PL:1  
**Names:** 200-W-157-PL:1; REDOX Chemical Sewer Line from 202-S to REDOX Process Sewer (Sitecode 200-W-152-PL)  
**Classification:** Accepted  
**Reclassification:** None

**Type:** Process Sewer  
**Status:** Inactive  
**Description:** Subsite 2 is the main system of underground vitrified clay pipeline with diameters of 20 centimeters (8 inch) and 30 centimeters (12 inch).

The SubSite is Part Of:

**Code:** 200-W-157-PL  
**Names:** 200-W-157-PL; Pipeline from 202-S to 200-W-152-PL and 216-S-10 Ditch; Pipeline from 205-S to REDOX Chemical Sewer; REDOX Chemical Sewer

**Code:** 200-W-157-PL:2  
**Names:** 200-W-157-PL:2; 10-Centimeter (4-Inch) VCP Chemical Sewer Line from 205-S  
**Classification:** Accepted  
**Reclassification:** None

**Type:** Process Sewer  
**Status:** Inactive  
**Description:** A 10 centimeter (4 inch) diameter vitrified clay pipe extends from the 205-S building to the main chemical sewer line.

The SubSite is Part Of:

**Code:** 200-W-157-PL  
**Names:** 200-W-157-PL; Pipeline from 202-S to 200-W-152-PL and 216-S-10 Ditch; Pipeline from 205-S to REDOX Chemical Sewer; REDOX Chemical Sewer

**Code:** 200-W-158-PL  
**Names:** 200-W-158-PL; Pipeline from 293-S to 200-W-152-PL  
**Classification:** Accepted  
**Reclassification:** None

**Type:** Process Sewer  
**Status:** Inactive  
**Description:** The waste site is an underground 20 centimeter (8 inch diameter) vitrified clay pipeline from the 293-S building to the 200-W-152-PL pipeline. It connects to the REDOX Process Sewer (200-W-152-PL) on the south side of 202-S at Manhole number 4.

**Location:** The pipeline is located east and south of 202-S.
Related Sites/ Structures: The pipeline is associated with the 293-S building and the REDOX Process Sewer (sitecode 200-W-152-PL).

*Hanford Site Waste Management Units Report*  
February 2015  
2513
**Status:** Inactive  
**End Date:**

**Description:** The waste site is an underground, 46 centimeter (18 inch) diameter, corrugated metal pipe.

**Location:** The pipeline is located southwest of the corner of 16th Street and Dayton Ave. It extends westward from the northwest corner of the 216-U-10 pond to the 216-U-11 trench. The pipeline crosses under Dayton Ave.

**Related Sites/Structures:** The pipeline is associated with the 216-U-11 trench and the 216-U-10 Pond.

**Process Description:** The pipeline transferred 216-U-10 Pond water to the 216-U-11 trench.

---

**Code:** 200-W-170-PL  
**Classification:** Accepted

**Names:** 200-W-170-PL; 216-U-16 Crib Pipeline

**Type:** Radioactive Process Sewer

**Status:** Inactive  
**End Date:**

**Description:** The waste site is an underground, 30.5 centimeter (12 inch) diameter, polyvinyl chloride pipeline.

**Location:** The pipeline is located south of 16th Street. The reinforced plastic pipe attaches to the U Plant Process Sewer (sitecode 200-W-84-PL).

**Related Sites/Structures:** The pipeline is associated with the U Plant Process Sewer (200-W-84-PL) and the 216-U-16 crib.

---

**Code:** 200-W-171

**Classification:** Accepted

**Names:** 200-W-171; 200-W-219-PL Line Leak; Leak from 234-5Z Pipe Trench to 241-Z Tank D-6

**Type:** Unplanned Release  
**Start Date:** 1/1/1969

**Status:** Inactive  
**End Date:**

**Description:** The release occurred within a concrete pipe trench. The concrete pipe trench is a subsurface feature extending from 234-5Z to 241-Z (see sitecode 200-W-219-PL).

**Location:** The release occurred in the pipe trench located south of 234-5Z that extended to the 241-Z tank enclosure.

**Release Description:** ARH-1048 states that on 2/18/69, approximately 114,000 liters (30,000 gallons) was sent to the 241-Z D-6 tank but it never got to the tank. To help find the cause of the unaccounted waste, water from 880 room 19 (button line) and the incinerator was sent to the D-6 tank. Only the water from the incinerator reached the D-6 tank, indicating a leak in the common waste line from 880 and the button line. Further checks showed that the concrete trench was cracked and the sump pipe was broken near the north side of the road.

**Related Sites/Structures:** The release is associated with pipeline 200-W-219-PL.

**Waste Type:** Steam Condensate
<table>
<thead>
<tr>
<th>Waste Description:</th>
<th>Based on available plant records, leakage into the pipe trench ranged from 11,400 liters (3,000 gallons) to 114,000 liters (30,000 gallons) containing between 3 and 30 grams of plutonium.</th>
</tr>
</thead>

<tr>
<td>Names:</td>
<td>200-W-172; Liquid Leaking from Drain Laterals Below 234-5Z Floor Slab</td>
</tr>
<tr>
<td>Type:</td>
<td>Unplanned Release</td>
</tr>
<tr>
<td>Status:</td>
<td>Inactive</td>
</tr>
<tr>
<td>Description:</td>
<td>The waste site is a series of underground pipes. Secondary drain laterals conveyed liquid from various points in the 234-5Z building to the main drain lines in the subsurface pipe tunnels. Visual observations in the pipe tunnels revealed little evidence of substantial leakage.</td>
</tr>
<tr>
<td>Location:</td>
<td>The release location is the soil underneath the 234-5Z building.</td>
</tr>
<tr>
<td>Related Sites/Structures:</td>
<td>The release is associated with the Plutonium Finishing Plant processes.</td>
</tr>
<tr>
<td>Process Description:</td>
<td>Fifty-two side lateral pipes conveyed process liquids into the main 234-5Z tunnel drain lines. Approximately fifteen lateral lines appear to have possibly leaked.</td>
</tr>
<tr>
<td>Waste Type:</td>
<td>Steam Condensate</td>
</tr>
<tr>
<td>Waste Description:</td>
<td>Small pipe leaks in the tunnels over time may have accumulated a quantity of less than 3 grams of plutonium.</td>
</tr>

| Type:              | Radioactive Process Sewer                                                                                                                         |
| Status:            | Inactive                                                                                                                                     |
| Description:       | The waste site is two parallel underground, 5 centimeter (2 inch) diameter stainless steel lines that diverted from a concrete encasement to feed 216-Z-1A and the 216-Z-18 crib. This |
pipeline bypassed the 241-Z-361 settling tank. The line numbers are 1035 and 1036.

**Location:**
The pipeline extends south from the 234-5Z facility to the 216-Z-1A tile field. Part of the pipeline is located inside the PFP security fence and part is located outside the security fence.

**Release Description:**
In 1971, the 216-Z-18 Crib line broke near the southwest corner of the 236-Z Building. An excavation of the area uncovered gross alpha contamination in the soil. See UPR-200-W-103

**Related Sites/Structures:**
The waste lines are associated with 234-5Z and 216-Z-1A, 216-Z-18 and UPR-200-W-103.

**Process Description:**
Lines 1035 and 1036 divert out of a concrete encasement that connected 242-Z with 234-5Z. Lines 1035 and 1036 bypass the 216-Z-1, 216-Z-2 and 216-Z-3 cribs and route the waste directly into the 216-Z-1A tile field (see subsite 1). Later the effluent was directed to the 216-Z-18 crib (see subsite 2).

### 200-W-175-PL; Line V681; Pipeline to Route Waste from 241-T-112 to 216-TY-201 Flush Tank and 216-T-26, 216-T-27 and 216-T-28 Cribs

**Reclassification:** None

**Type:** Radioactive Process Sewer

**Status:** Inactive

**Description:** The site is an underground carbon steel pipeline extending from the 241-T-112 tank to the 216-TY-201 Flush Tank. Pipeline diameters vary from 7.6 centimeters (3 inches) and 8.9 centimeter (3.5 inch) diameter to 10 centimeters (4 inches).

**Location:** The pipeline extends southeast out of the 241-T Tank Farm. Most of the pipeline is located south of 23rd Street. The line crosses under Camden Ave. Part of the line is located on the east side of Camden Ave. and part is on the west side of Camden Ave. A portion of the pipeline is inside the 241-T tank farm.

**Related Sites/Structures:** The site is associated with the 241-T-112 tank, the 216-TY-201 Flush Tank and pipeline 200-W-167-PL.

**Process Description:** The waste to 216-T-26 originally came from the 241-TY tank farm. In 1956, the pipeline from 241-TY tank farm to the 216-T-26 crib was isolated by installing a blank flange in the pipe between the east perimeter fence of the 241-TY Tank Farm and Camden Ave. A portion of an existing pipeline (see 200-W-167-PL) was re-used to create a new pipeline that routed waste from 241-T-112 tank (inside 241-T tank farm) to the 216-T-201 flush tank and the 216-T-26 crib. The 8.9 centimeter (3.5 inch) diameter pipe changes to a 7.6 centimeter (3 inch) diameter pipe where the pipeline turns eastward to connect with the 241-T-201 Flush Tank.

---

### 200-W-176-PL

**Reclassification:** None

**Type:** Encased Tank Farm Pipeline

**Status:** Inactive

**Description:** The waste site is an underground concrete transfer line encasement. All of the lines inside the encasement are 9 centimeter (3.5 inch) diameter stainless steel lines.

**Location:** The concrete encasement extends eastward from 241-TX tank farm to the 241-TX-155 Diversion Box, located east of Camden Ave.

**Related Sites/Structures:** The waste site is associated with the 241-TX-153 Diversion Box and the 241-TX-155 Diversion Box.

---

### 200-W-177-PL

**Reclassification:** None

**Type:** Direct Buried Tank Farm Pipeline

**Status:** Inactive

**Description:** The waste site is two, 9 centimeter (3.5 inch) stainless steel lines buried in a common soil.
trench. Line V7616 extends between the 241-TXR-151 Diversion Box (inside the 241-TX tank farm) to the 241-TX-155 Diversion Box (outside the tank farm). Line V7653 extends from the 244 TXR Vault (inside the 241-TX tank farm) to the 241-TX-155 Diversion Box (outside the tank farm).

Location: The pipelines extend eastward from the 241-TX tank farm to the 241-TX-155 Diversion Box, located east of Camden Ave.

Related Sites/Structures: The pipelines are associated with the 241-TXR-151 Diversion Box, the 241-TXR Vault and the 241-TX-155 Diversion Box.

### Direct Buried Tank Farm Pipeline

**Status:** Inactive  
**Start Date:**  
**End Date:**

**Description:** The waste site is an underground, 15.2 centimeter (6 inch) diameter, carbon steel pipeline that connects the 241-U-151, 241-U-152 and 241-U-153 Diversion Boxes to the 241-U-301 Catch Tank. Individual 10 centimeter (4 inch) diameter drain lines from the three diversion boxes connect to the same 10 centimeter (4 inch) diameter pipeline to the catch tank.

**Location:** The pipeline is near the corner of 16th Street and Camden Ave. It crosses under Camden Ave. Approximately one third of the drain line is located outside of the 241-U Tank Farm, east of the tank farm fence. Approximately two thirds of the pipeline is located inside the 241-U Tank Farm fence. The catch tank is located inside the tank farm fence. Diversion Boxes 241-U-151 and 241-U-152 are located outside the tank farm fence. 241-U-153 is located inside the tank farm fence.

**Related Sites/Structures:** The pipeline is associated with the 241-U-151, 241-U-152 and 241-U-153 Diversion Boxes and the 241-U-301 Catch Tank.

**Process Description:** The pipeline provided diversion box drainage to the 241-U-301 catch tank.

**Code:** 200-W-185-PL  
**Classification:** Accepted

---

### Encased Tank Farm Pipeline

**Status:** Inactive  
**Start Date:**  
**End Date:**

**Description:** The waste site is two underground, 9 centimeter (3.5 inch) diameter, stainless steel lines buried in the same soil trench.

**Location:** The lines are located near the corner of 16th Street and Camden Ave. The lines cross under Camden Ave. A portion of these lines is located inside the 241-U Tank Farm.

**Related Sites/Structures:** The lines are associated with the 241-U-151 and 241-U-153 diversion boxes.

**Process Description:** The lines transferred waste between the 241-U-151 and 241-U-153 Diversion Boxes.

**Code:** 200-W-186-PL  
**Classification:** Accepted

---

### Encased Tank Farm Pipeline

**Status:** Inactive  
**Start Date:**  
**End Date:**

**Description:** The waste site is an underground concrete encasement that contains two 9 centimeter (3.5 inch) diameter stainless steel pipelines.

**Location:** The pipelines originate north of the REDOX, at the 240-S-152 Diversion Box. The extend eastward and connected to the 204-S and 205-S facilities.
**Related Sites/Structures:**
The pipelines are associated with 240-S-152 Diversion Box and the 204-S and 205-S facilities.

**Process Description:**
The pipeline transferred waste from the 240-S-152 Diversion Box to the 205-S process cell. Line 1045 was rerouted to connect directly to the 204-S facility.

**Reclassification:**
- 200-W-187-PL; Lines V552, V553 and V555; Transfer Lines Between 240-S-151 and 240-S-152 Diversion Boxes
- 200-W-188-PL; Waste Distribution Line from 216-TY-201 Flush Tank to 216-T-26, 216-T-27 and 216-T-28 Cribs and Truck Unloading Station Line

**Location:**
The waste site is a concrete encasement containing three 9 centimeter (3.5 inch) diameter stainless steel pipelines.

**Location:**
The pipelines are located north of the 202-S building, connecting the 240-S-151 diversion box to the 240-S-152 diversion box.

**Related Sites/Structures:**
The pipelines are associated with the 240-S-151 and 240-S-152 diversion boxes.

**Description:**
- The waste site is the underground, 35.5 centimeter (14 inch) diameter, carbon steel waste distribution line from the flush tank to the cribs. A 15 centimeter (6 inch) diameter poly vinyl chloride pipeline extends from the truck unloading station (see sitecode 200-W-82), east of the cribs, to the main crib distribution line.

**Location:**
The lines are located east of Camden Ave. They extend south from the 216-TY-201 flush tank to feed the 216-T-26, 216-T-27 and 216-T-28 cribs.

**Related Sites/Structures:**
The pipeline is associated with the 216-TY-201 flush tank and the 216-T-26, 216-T-26 and 216-T-28 cribs.

Encased Tank Farm Pipeline

Inactive

The waste site is a concrete encasement that contains three 7.6 centimeter (3 inch) diameter stainless steel lines and one 7.6 centimeter (3 inch) diameter carbon steel line.

Location:
The transfer line is located southwest of T Plant. It extends from 241-TX-155 Diversion Box to the 241-TY-153 Diversion Box. The line crosses under Camden Ave.

Release Description:
See UPR-200-W-135

Related Sites/Structures:
The lines are associated with the 241-TX-155 and 241-TY-153 Diversion Boxes and pipeline 200-W-105-PL from U Plant. This line is also associated with UPR-200-W-135.

---

Radioactive Process Sewer

Inactive

The majority of the waste site is an underground, 61 centimeter (24 inch) diameter, vitrified clay pipe that carried waste from U Plant operations to the 207-U Retention Basin. A 61 centimeter (24 inch) cast iron line from 221-U, two 25 centimeter (10 inch) cast iron lines and a 10 centimeter (4 inch) diameter steel line from 224-U feed the main VCP process sewer.

Location:
The pipeline is located west of U Plant and north of 16th Street.

Related Sites/Structures:
The pipeline is associated with the U Plant facilities and the 207-U Basin.

Process Description:
The 207-U basin received process sewer waste from the 221-U Building and the 224-U Building through this pipeline.

---

Hanford Site Waste Management Units Report
February 2015
| Code:  | 200-W-196-PL          | Classification: | Accepted       |
| Names: | 200-W-196-PL; Pipelines from Railcar Unloading Stations to 216-T-34 Crib | Reclassification: | None          |
| Type:  | Radioactive Process Sewer | Start Date:     | End Date:     |
| Status:| Inactive                |                |               |

**Description:**
The waste site is two parallel underground pipelines that extend from railcar Unloading Stations 1 and 2 to the 216-T-34 crib. The two lines are buried in the same soil trench. One of the pipelines is constructed of 20 centimeter (8 inch) diameter vitrified clay. The other pipeline is constructed of 15 centimeter (6 inch) diameter polyvinyl chloride. The railcar unloading stations are WIDS sitecode 200-W-21.

**Location:**
The pipelines are located west of T Plant, near the railroad tracks that led into the T Plant area. Railcar Unloading Stations 1 and 2 (see sitecode 200-W-21) were located on the railroad tracks. The pipelines extend from the unloading stations to the crib.

**Related Sites/Structures:**
The pipelines are associated with sitecodes 200-W-21 and 216-T-34 and 216-T-35 cribs.

**Process Description:**
The railcar unloading stations were used to unload 300 Area liquid laboratory waste sent in railroad tanker cars from the 340 Facility. The waste was pumped into the adjacent 216-T-34 and 216-T-35 Cribs.

---

| Code:  | 200-W-197-PL          | Classification: | Accepted       |
| Names: | 200-W-197-PL; Pipelines from Railcar Unloading Stations to 216-T-35 Crib | Reclassification: | None          |

Type: Radioactive Process Sewer
Status: Inactive

Classification: Accepted
Reclassification: None
Start Date: 
End Date: 

Description: The waste site is two underground, 3.8 centimeter (1.5 inch) diameter stainless steel pipes that connected the 234-5Z building with the 216-Z-9 crib.

Location: The pipeline is located east of the Plutonium Finishing Plant main building. It extends beyond the double security fence.

Related Sites/Structures: The waste site is associated with the 216-Z-9 crib and also the 200-W-205-PL pipeline (the pipeline to the 241-Z-8 tank).

Code: 200-W-207-PL:1
Classification: Not Accepted
Reclassification: 200-W-207-PL:1; Process Sewer Main Pipeline Radioactive Process Sewer Not Specified

This section of pipeline originally extended from the northwest corner of 2736-ZB to the "Z" ditches. It includes manholes Z1, Z2 and Z7.

This section of pipe is considered Active and now part of 200-W-207-PL-B.

The SubSite is Part Of:
Code: 200-W-207-PL

Reclassification: 200-W-207-PL:2; Process Sewer Branch from 236-Z to Manhole 7 Radioactive Process Sewer Not Specified

This portion of pipe is considered Active and part of 200-W-207-PL-B.

The SubSite is Part Of:
Code: 200-W-207-PL

Reclassification: 200-W-207-PL:3; Acid Waste Line to Manhole 3 Radioactive Process Sewer Not Specified

This section of pipeline extends from the southeast corner of 234-5Z to manhole Z3 connecting to 291-Z. This segment of pipe is considered active and part of 200-W-207-PL-B.

The SubSite is Part Of:
Code: 200-W-207-PL

Reclassification: 200-W-207-PL-A; Segment of PFP Process Sewer from manhole Z8 to Z Ditches Radioactive Process Sewer Inactive

The waste site is the inactive, underground vitrified clay pipe that connected to manhole number 8 to the 216-Z-1, 216-Z-11 and 216-Z-19 ditches and the 216-Z-20 tile field.

Location: The process sewer lines extend south from the 234-5Z building and east to the 216-Z-1, 216-Z-
11 and 216-Z-19 ditches. The pipeline was later diverted to the 216-Z-20 tile field.

**Description:** The waste site is an underground, 15 centimeter (6 inch) diameter stainless steel line that fed the 216-Z-12 crib through the 200-W-59 diversion box. It extends from the 200-W-58 diversion box. The pipeline was divided into three subsites. Originally, a 12 inch diameter vitrified clay pipeline extended from the diversion box to the head end of the crib structure (subsite 2). A 6 inch stainless steel bypass line was later installed that entered the crib, south of the head end (subsite 3).

**Location:** The pipeline is located south of the PFP facility. Most of it is located between the two security fences. It extends west from diversion box number 1 (200-W-58) to diversion box number 2 (200-W-59) and then drops south to the 216-Z-12 crib.

**Related Sites/Structures:** The pipeline is associated with the 241-Z facility, 200-W-58, 200-W-59 and the 216-Z-12 crib.

**This Site has the Following SubSites:**

</tr>
</tbody>
</table>

**Description:** Subsite 1 is the pipe segment extending (east to west) from the 200-W-58 diversion box to the 200-W-59 diversion box. It is a 6 inch diameter, stainless steel pipe. The segment is approximately 180 meters (592 feet) long.

**Location:** The subsite segment is located inside the southern portion of the PFP facility and between the two security fences.

Tank to 216-Z-1, 216-Z-2 and 216-Z-3 Cribs and 216-Z-1A Tile Field

Type: Radioactive Process Sewer
Status: Inactive

Description: The waste site is an underground, 20 centimeter (8 inch) diameter stainless steel pipeline extending from the 241-Z-361 settling tank to the 216-Z-1, 216-Z-2 and 216-Z-1A. A 20 centimeter (8 inch) diameter vitrified clay pipe feed line branches off to the 216-Z-3 crib. Another 20 centimeter (8 inch) diameter vitrified clay pipe is a crib overflow line from 216-Z-3 crib to 216-Z-1A (see subsites).

Location: The pipelines are located south of the 234-5Z facility. The majority of the lines are located south of the PFP security fence.

Related Sites/Structures: The pipeline is associated with the 241-Z-361 settling tank, the 216-Z-1, 216-Z-2 and 216-Z-3 cribs and the 200-W-58 diversion box (diversion box #1). 200-W-174-PL tees off this pipeline.

Type: Radioactive Process Sewer
Status: Inactive

The SubSite is Part Of:
Code: 200-W-210-PL
Names: 200-W-210-PL; Pipeline from 241-Z-361 Settling Tank to 216-Z-1, 216-Z-2 and 216-Z-3 Cribs and 216-Z-1A Tile Field

Code: 200-W-212-PL
Names: 200-W-212-PL; Encased Transfer Line from 240-S-151 Diversion Box to Pipeline 200-W-153-PL; Lines V546, V551, V544, V548 and V549
Type: Encased Tank Farm Pipeline
Status: Inactive
Description: The waste site is a six line, concrete encasement from the 240-S-151 Diversion Box. Three lines (V546, V549, V551) are stubbed off and were never used. The other three lines (V544, V548 and V550) connect to a reducer, where the three lines become one line. The three lines carried REDOX steam condensate waste. They exit the encasement and feed into 200-W-153-PL.
Location: The pipeline is located northwest of 202-S. It extends west from the 240-S-151 Diversion Box.
Related Sites/Structures: The pipeline is associated with the 240-S-151 Diversion Box, 2904-S-171, 216-S-6, 216-S-17 and pipeline 200-W-153-PL.
Process Description: Lines V546, V549 and V551 were stubbed off and never used. Lines V544, V548 and V550 transferred REDOX steam condensate waste. They tied into a 10 inch line that sent waste to 216-S-6 Crib.

Code: 200-W-213-PL
Names: 200-W-213-PL; Lines V795, V606 and V605; Pipelines from 241-TX-153 Diversion Box and 241-TX-302A to 216-T-19 Crib
Type: Radioactive Process Sewer
Status: Inactive
Description: The waste site is two underground stainless steel pipelines inside a concrete encasement. The lines transferred waste from the 241-TX-153 Diversion Box and the 241-TX-302A Catch Tank to the 216-T-19 crib.
Location: The pipeline is located west of Camden Ave. It extends south from inside the 241-TX tank
farm at the 241-TX-153 Diversion box to the 216-T-19 crib.

**Related Sites/Structures:** The pipeline is associated with the 241-TX-153 Diversion Box, the 241-TX-302A catch tank and the 216-T-19 crib.

### Type: Radioactive Process Sewer  Start Date:  End Date:

### Status: Inactive

### Description: The waste site is six underground stainless steel pipes inside a concrete encasement that transferred waste from 234-5Z to the 241-Z tanks. The pipe diameters range from 7.6 centimeters (3 inch) to 20 centimeters (8 inch).

### Location: The pipelines inside an encasement, known as a pipe tunnel, that extends from the south wall of 234-5Z to the north side of 241-Z. They are located inside the PFP security fence.

### Release Description: Between 11,400 liters (3,000 gallons) and 114,000 liters (30,000 gallons) of waste is estimated to have leaked into the concrete pipe trench and effected the soil below the trench. See sitecode 200-W-171.

### Related Sites/Structures: The pipeline is associated with the 241-Z tanks and Unplanned Release sitecode 200-W-171.

Type: Radioactive Process Sewer  
Status: Inactive  
Description: Subsite 2 is the portion of piping from 236-Z connecting to Pipeline from 234-5Z to West Side of 241-Z.

The SubSite is Part Of:
Code: 200-W-224-PL  
Names: 200-W-224-PL; Pipeline from 234-5Z and 236-Z to West Side of 241-Z

Code: 200-W-225-PL  
Names: 200-W-225-PL; PFP Six Inch Condensate Line Connecting to Process Sewer  
Type: Radioactive Process Sewer  
Status: Inactive  
Description: The waste site begins as an underground, 15 centimeter (6 inch diameter) carbon steel condensate pipeline that connected 234-5Z with the Z Plant Process Sewer (see sitecode 200-W-207-PL). Other portions of the pipe are constructed of transite and corrugated metal. 
Location: The pipeline is located inside the Plutonium Finishing Plant security fence. It extends from the southwest corner of 234-5Z to southeast of 232-Z. 
Related Sites/Structures: The pipeline is associated with 234-5Z and the 200-W-207-PL process sewer. 
Process Description: A portion of this pipeline was removed during the construction of the 232-Z building (around 1960). The pipeline was redesigned to direct the flow around the 232-Z building.

Code: 200-W-226-PL  
Names: 200-W-226-PL; Lines V326, V671 and V706; Pipeline from 224-T (Plutonium Concentration Facility) to 241-T-361 Settling Tank and 216-T-3 Reverse Well  
Type: Radioactive Process Sewer  
Status: Inactive  
Description: The waste site is an underground, 7.6 centimeter (3 inch diameter) stainless steel pipeline that carried waste from the 224-T Plutonium Concentration Facility to the 216-T-361 Settling Tank and the 216-T-3 Reverse Well. 
Location: The pipeline is located north of 23rd Street. It extends from the east side of 224-T to the 216-T-3 Reverse Well. 
Release Description: UPR-200-W-102 may be associated with this pipeline. 
Related Sites/Structures: The pipeline is associated with 216-T-3 reverse well and 241-T-361 settling tank and pipeline 200-W-132-PL.

</tbody>
</table>
The waste site is a series of underground carbon steel pipelines associated with the 276-S-141 and 276-S-142 hexone tanks. A 6 centimeter (2.5 inch) diameter carbon steel line extended from the railroad track to the tanks. A 6 centimeter (2.5 inch) diameter outlet line and a 5 centimeter (2 inch) diameter inlet line is associated with each tank.

The pipeline is located northwest of the 202-S canyon building.

The tanks stored various liquid mixed wastes until 1992, when most of the waste was transferred to tank cars for off-site incineration. From 1951 to 1967 the tank was used to store reagent-grade hexone for makeup as a solvent at REDOX. The hexone was delivered to REDOX in rail cars that were unloaded into the 276-S-141 and 241-S-142 tanks via underground lines at the railcar unloading station.

### The SubSite is Part Of:

| Code: 200-W-230-PL |
| Names: 200-W-230-PL; Pipeline from Railroad Unloading Station to 276-S-141 and 276-S-142 Hexone Tanks |

| Code: 200-W-231 | Classification: Accepted |
| Names: 200-W-231; Temporary Facilities Construction Trailer Septic Tank and Tile Field |
| Type: Septic Tank | Start Date: 1/1/1951 |
| Status: Inactive | End Date: |

**Description:** The septic and tile field are not visible. They are not marked or posted. They were noticed on Hanford Site drawing H-2-2289. Exact coordinates are not available.

**Location:** The septic tank and tile field are located west of Camden Ave. and south of 23rd St. They are approximately 16.7 meters (55 feet) south of the 200-W-79-PL pipeline, the pipeline that feed the 216-T-36 crib.

**Process Description:** During the 1950's, many Temporary Construction buildings were set up to support construction activities. H-2-2289 was drawn in February 1951. It shows a septic tank and tile field that supported a Temporary Construction office and an X-ray laboratory. The Temporary construction facilities were supporting the construction of 241-TY Tank Farm.

**Waste Type:** Not Specified

**Waste Description:** H-2-2289 was drawn in February 1951. It shows a septic tank and tile field that supported a Temporary Construction office and an X-ray laboratory. It is possible that x-ray development solutions were discharged to the septic system.

| Code: 200-W-232 | Classification: Accepted |
| Names: 200-W-232; 2607-WT Replacement Septic Tank and Dry Well |
| Type: Septic Tank | Start Date: |
| Status: Inactive | End Date: |

**Description:** The waste site is an underground septic tank and associated dry well. It is surrounded with post and chain and a sign that reads "MISF". The acronym stands for Miscellaneous Inactive Storage Facility.

**Location:** The septic tank and dry well are located northeast of the 242-T Evaporator building near an entrance gate to the 241-TY Tank Farm. The septic system is located outside the tank farm fence.
Process Description: The 2607-WT septic system is located inside the tank farm fence. It was abandoned. The new system was placed outside the tank farm fence. It consists of a septic tank and a dry well. It serviced the 242-T Evaporator building.

**Code:** 200-W-237  
**Classification:** Accepted  
**Names:** 200-W-237; Effluent Pond South of T Plant  
**Reclassification:** None  
**Type:** Pond  
**Start Date:**  
**End Date:**  
**Status:** Inactive  
**Description:** The waste site is square, open excavation was visually apparent in January 2011. It is surrounded by several orange stakes. The top of the square excavation is estimated to be approximately 15 by 15 meters (50 by 50 feet) and 1.2 meters (four feet) deep. A grey polyvinyl chloride pipe is visible extending into the excavation in the northeast corner of the hole.

**Location:** The square excavation is located about 6 meters (20 feet) south of 23rd Street, near Beloit Ave. in 200 West Area.

**Related Sites/Structures:** The excavation is fed by a 4 inch PVC pipeline that originates at the 224-T building.

---

**Process Description:**

The excavation is labeled "Pond" on H-2-44511, sheet 132. However, the excavation was never assigned a Hanford liquid waste site number. Cribs, ponds and ditches in the 200 Areas were usually assigned a number that began with 216, indicating it was a liquid waste site in the 200 Area (116 indicates a liquid waste site in 100 Areas and 316 indicates a liquid waste site in 300 Area). Since it was not assigned a number, it is possible it was built but never put into service. H-2-44511, sheet 132 says the drain line has been plugged and abandoned.

**Code:** 200-W-238  
**Classification:** Accepted  
**Names:** 200-W-238; Large Diameter French Drain North of 241-U  
**Reclassification:** None  
**Type:** French Drain  
**Start Date:**  
**End Date:**  
**Status:** Inactive  
**Description:** The french drain is surrounded with chain and a sign that reads "MISF Area, No Vehicles or Storage, Contact Shift Office prior to Entry". The blue building in the background (inside the tank farm fence) is the 241-U-271 Control House. MISF means Miscellaneous Isolated Storage Facility.

**Location:** The large diameter french drain is located in 200 West Area, on the west side of Camden Ave., adjacent to the north side of the 241-U Tank Farm fence.

**Process Description:** Drawings H-2-40093 and H-2-40241 show this french drain is connected to the 241-U-271 Control House mechanical equipment room via a 15 centimeter (6 inch) diameter vitrified clay pipeline encased in concrete.

---

**Code:** 200-W-239  
**Classification:** Accepted  
**Names:** 200-W-239; 211-U and 211-UA Potential Asbestos in Soil; Post Remediation URMA  
**Reclassification:** None
The waste site was originally an irregularly shaped, posted Underground Radioactive Material Area (URMA) that was defined after the 211-A and 211-UA tank farms were demolished in 2009. Following demolition, three to six inches of surface material was removed prior to applying a gravel cap. Determination of potential asbestos containing material (ACM) left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

**Location:** The area is located on the northwest side of 221-U. It is west of Beloit Ave. and north of 16th Street.

**Related Sites/Structures:** The demolished tank farm and resulting URMA are associated with 221-U, 221-U:1 and 221-U:2.

**Process Description:** The aboveground features of the 211-U Tank Farm were removed in 2009. It was a bulk liquid storage area, consisting of nine aboveground storage tanks. The tanks are located on the west side of the 221-U building. Six tanks are horizontal tanks, 2.7 meter diameter, 11 meters long (9 foot diameter, 36 feet long). Three of the horizontal tanks were sodium hydroxide storage tanks, one was a demineralized water storage tank and two were considered spare tanks. Three tanks are vertical tanks, 3 meter diameter, 4.2 meters high (10 foot diameter, 14 feet high). One was a demineralized water storage tank and two were chemical make-up tanks. The bulk liquid was transferred to the 211-U tanks from rail cars or trucks.

The aboveground features of the 211-UA (alias 211-AU) Tank Farm were removed in 2009. It consisted of sixteen aboveground storage tanks. Thirteen tanks had a capacity of 380,000 liters (100,000 gallons) each. The tanks were located on the west side of the 221-U building. Nine of these tanks were nitric acid storage tanks and four were sodium hydroxide storage tanks. Three smaller tanks 2.7 meters in diameter and 2.7 meters tall (9 feet diameter, 9 feet tall) were nitric acid sample tanks. The bulk liquid was transported to the tanks in railcars or trucks.

The 200 West Area shop structures were demolished in 2009. The waste site is a gravel capped area surrounded with concrete blocks, posts and chain. Signs on the chain state "Caution: Potential Asbestos Hazard; Transite in the Soil; No ground-intrusive or heavy equipment activities in this area unless specifically authorized by controlling project OS&H" and "Stop" with a Contact phone number and required Protective Clothing listed.

Although the area is referred to as Industrial Seven, only six buildings are covered by the gravel cap. The six demolished buildings covered by the gravel cap are: 272W, 277W, 2723W, 2728W, 2720W and 274W. Buildings 2707W, 2723W, 277W and 272W were determined to potentially have asbestos containing material left in place. Determination of ACM left in place and abated during demolition is based on a Quality Assurance review of project documentation and interviews with activity personnel.

Location: The site is located east of Beloit Ave. and north of 20th Street where the 200 West Area shop buildings had been located.

The waste site is three gravel areas surrounded with posts and chain. Signs on the chain state "Caution: Potential Asbestos Hazard; Transite in the Soil; No ground-intrusive or heavy equipment activities in this area unless specifically authorized by controlling project OS&H". Although the areas are gravel, no additional gravel cap has been placed on these sites. Three In-Use groundwater wells along with aboveground pump and treat piping and electric cables are located inside the large posted area north of 216-Z-9 crib. Another large posted area is east of MO273 and encompasses the 216-Z-8 tank and french drain. A smaller, triangle shaped posted area is south of MO273.

Location: There are three posted areas. One is located on the east side of the 200-W-70 Burn Pit waste site, adjacent to the west side of the MO273 trailer. One is located near the southeast corner of the MO273 office trailer. One is north of the 216-Z-9 crib. They are all west of Camden Ave. and south of 19th Street.
### Related Sites/Structures:
The potential asbestos may be associated with the old PFP burn pit, sitecode 200-W-70. MO273 is situated on top of where the old burn pit was located. The posted area for 200-W-247 encompasses the north side of the MO273 trailer.

### Code: 200-W-252
- **Classification:** Accepted
- **Names:** 200-W-252; X8 Railcar Shed Potential Asbestos in Soil
- **Type:** Dumping Area
- **Status:** Inactive
- **Description:** The waste site is the location of the demolished railcar shed known as X8. It is currently not marked or posted.
- **Location:** The X8 shed was located next to rail line switch gear, southwest of MO-278. It is northwest of the intersection of 20th Street and Beloit Ave.

### Code: 200-W-253
- **Classification:** Accepted
- **Names:** 200-W-253; 233-S and 233-SA Contaminated Soil Footprint
- **Type:** Post Demolition Remediation Area
- **Status:** Inactive
- **Description:** The waste site is the footprint of the demolished 233-S and 233-SA buildings. The building footprints were covered with concrete and two feet of gravel. They form a single, "L-Shaped" polygon. Contaminated soil, piping and ducting remain beneath the concrete and gravel cap. The footprint is located inside a locked, chain link fence. The chain link fence is posted with Underground Radioactive Material signs.
- **Location:** The waste site is located on the north side of the 202-S canyon facility.

### Code: 200-W-255
- **Classification:** Discovery
- **Names:** 200-W-255; PFP Remediation Area
- **Type:** Post Demolition Remediation Area
- **Status:** Inactive
- **Description:** The waste site is the area designated to be the post demolition remediation area following the D&D activities at the Plutonium Finishing Plant (PFP). The PFP structures will be removed to "slab on grade" status. The post demolition remediation area will address any remaining subsurface structures, pipelines and contaminated soil.

### Code: 2607-W13
- **Classification:** Discovery
- **Names:** 2607-W13; Construction Trailers Septic; JA Jones/Kaiser Construction Trailers Septic

*Hanford Site Waste Management Units Report*

February 2015
Description: There is no visual evidence of a septic tank. The tank was listed in the 2007 Hanford Site Sanitary Liquid Waste and Sanitary Solid Waste Master Plan.

Location: The septic tank is supposed to be located north of 19th Street and west of Beloit Ave, in the Construction Trailer area.

Process Description: There is very little information documented for this septic system.

---

**Code:** 2607-W16  
**Classification:** Accepted  
**Names:** 2607-W16; Large Onsite Sewer System (LOSS); 200 West Area Regional Wastewater System  
**Reclassification:** None  
**Type:** Septic Tank  
**Status:** Active  
**Start Date:** 1/1/2003  
**End Date:**

**Description:** The waste site is an active septic system. The septic tile field is marked and posted.

**Location:** The septic system is located east of Bridgeport Ave. and north of 20th Street. It is northwest of the 284-W Powerhouse.

**Related Sites/Structures:** This septic system is associated with 2607-Z1 and 2607-W1.

**Process Description:** The 2607-W16 sanitary septic system was installed to receive the waste volume that was overwhelming the 2607-W1 system. The entire Plutonium Finishing Plant (PFP) sanitary waste volume was redirected to the 2607-W16 sanitary system. An average flow of 6845 gallons per day is sent to the 2607-W16 septic system.

**Start Date:** 1/1/1951  
**End Date:**

**Description:** The 2607-WUT Septic Tank is constructed of steel and includes a drain field. It is surrounded with an "L" shaped chained area and signs that read Sanitary Tile Field. There is a depressed area on the east end, inside the chain, that indicates a cave-in has occurred over the tile field. There is also a corrugated metal caisson, posted with a Confined Space sign, in the northwest corner of the chained tile field.

**Location:** This unit is located north of the 241-U Tank Farm.

**Related Sites/Structures:** The 2607-WUT Septic Tank is associated with the 241-U-271 Control House.

**Process Description:** The 2607-WUT Septic Tank and drain field were designed to accept sanitary sewer effluent from the associated structures. H-2-40241 states that it is fed by a 15.2 centimeter (6 inch) vitrified clay pipe that is encased in concrete.

---

**Code:** 232-Z  
**Classification:** Accepted
**Names:** 232-Z; 232-Z Building Foundation; 232-Z Incineration Facility; 232-Z Incinerator; 232-Z Waste Incineration Facility

**Type:** Process Unit/Plant  
**Start Date:** 1/1/1959  
**End Date:** 1/1/1976

**Description:** The 232-Z above grade structures were demolished to slab on grade in July 2006. All penetrations through the floor slab were plugged with grout or a fire block material (low density silicone elastomer) prior to building demolition. After building demolition, the floor slab was painted with Polymeric Barrier System (PBS) fixative and then covered with a minimum of 6 inches of gravel. The gravel covered slab is posted with Underground Radioactive Material signs. Fixed contamination was identified on the sidewalk between 232-Z and 2731-ZA. The sidewalk was sprayed with a vinyl material and painted yellow. A section of asphalt south of 2736-ZC (adjacent to 232-Z) was found to be contaminated. This area was re-surfaced with asphalt. All areas were posted as Underground Radioactive Material Areas (URMA).

The underground ventilation ducting from the 232-Z Building to the 291-Z Building was filled with a controlled density fill (i.e., grout). The 232-Z incinerator building had been a concrete block structure with a slightly sloped roof. The building was divided into areas devoted to processing, storage, change rooms, chemical preparation, ventilation, and utility distribution. The building had two stories at the north end and a single story over the remaining portions.

**Location:** The building was located adjacent to the south side of 2736-ZB.

**Related Sites/Structures:** Structures associated with the facility include internal glove boxes, incinerators, and leaching equipment. The building is related to other plutonium recovery and processing facilities at Z Plant.

**Process Description:** The 232-Z Facility was built to remove plutonium from contaminated solid wastes by incineration and leaching in preparation for plutonium recovery.

---

**Names:** 300-231; Substation C3-S15; Vitrification Test Site Transformer Pad

**Type:** Electrical Substation  
**Start Date:** 1/1/1983  
**End Date:** 1/1/1999

**Description:** The site concerns have been addressed and the waste site reclassified to Closed Out in 1999 and changed to Consolidated in 2013. It was consolidated with the 300 VTS waste site. It was considered Final Closed Out in 2014. It was a transformer station connected to a 13.8 KVA overhead powerline. The transformers have been removed. The transformers were used to provide electricity for in-situ vitrification tests at the 300 Vitrification Test Site (300 VTS), a separate WIDS site.

The transformers were located on a concrete pad and enclosed by a chain link fence. The transformers were numbered as follows: transformer #C4804P, serial #81439, property F176743; transformer #C4805P, serial #81441, property #176744; transformer #C4648P, serial #80097, property #176745. The transformers were single phase 200 KVA. The primary voltage for each of the transformers was 14400 and secondary voltage was 240/480. Each transformer weighed 544 kilograms (1200 pounds). Electric fluid capacity was 492.1 liters (130 gallons) and the fluid type was mineral oil.

**Location:** The transformer pad is located in the southeast corner of the 300 Vitrification Test Site, west of
Route Four South, across from the 300 Area.

**Release Description:** The operating records for the transformers document releases of transformer oil to the exteriors of the units (see Site Comment). The records do not document any releases to the transformer pad or the surrounding soil.

**Related Sites/Structures:** The transformer pad was related to the 300 Vitrification Test Site (300 VTS) and the associated Thermal Treatment and Test Facilities (TTTF).

**Process Description:** In-situ vitrification (ISV) was a thermal treatment process that converted contaminated soils and sludges into a glass and crystalline product. An electrical current was passed among an array of four electrodes imbedded in the contaminated soil or sludge, melting and glassifying it.

**Closure Info:** As of 5/13/1999, the transformers had been disconnected and removed from the site. The enclosure associated with the transformers is empty, and the concrete pad is clean. Maintenance records indicate any leaks were cleaned up before they reached the pad or the soil. The reclassification is documented on form 99-038.

**This Site Was Consolidated With:**

**Code:** 300 VTS  
**Names:** 300 VTS; In-Situ Vitrification (ISV) Test Site; 300 Area Vitrification Test Site

---

**Code:** 300-277  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 300-277; 300 Area Queue Contamination  
**Type:** Unplanned Release  
**Start Date:**  
**End Date:**

**Code:** 300-279  
**Classification:** Accepted  
**Reclassification:** Final No Action (5/12/2014)  
**Names:** 300-279; 3716 Automotive Repair Building Fuel Tanks  
**Type:** Storage Tank  
**Start Date:**  
**End Date:**

**Description:** The waste site has been evaluated and determined to require No Action. In 2014, the site was reclassified to Final No Action. It consisted of the historical location of underground diesel and gasoline storage tanks that were located to the north of the original 313 Bldg. (M-2885 sheet 1 rev 0), and east of the original 3716 Automotive Repair Bldg. location. The northern expansion of the 313 Bldg. was over this area where the tanks were located.

**Location:** It is located north of Ginko Street, east of the 303K, 305, and 314 Buildings, and west of the 3712 and 3720 Buildings. The 313 Building is located at the north end of the main 300 Area (within the security fence). The 300-279 waste site is located at Washington State Plane coordinates N 116198.8, E 593873.4. The 313 Building footprint encompasses a large portion of the 300-279 waste site location.

300-279 was located within WIDS site UPR-300-38 boundary, which is contaminated soil beneath the 313 Building. The contamination resulted from multiple unplanned release events. With the exception of the fuel tanks, the soil contamination is beneath the southern half of the 313 Building. The fuel contamination, if any, would lie in the northern expansion on the eastern side of the building. Remediation of the UPR-300-38 waste site was performed from January 10, 2010, through June 2, 2011.
Process Description: Concurrently with the construction of the 313 Building in the 1940's, a fuel station built to the north of the 313 Building (M-2885 sheet 1 rev 0). The fuel station was used to dispense both gasoline and diesel fuels to power machinery and vehicles used for construction (19450108 98026_[N1619631] and 19450108 8027_[N1619634]). The fuel pumps were on a concrete island and were associated with two underground tanks. This fuel station was used until 1947. Volume 22 of HAN-27990 page 27: states "Removed 1947, one gas pump now located at 301 Bldg., one underground tank located at 301 Bldg. Disposition of one gas pump and one underground tank not known." Based on this information, one pump and one tank were removed and were relocated to the 301 Building. It was not known if the second tank was removed or not, or if there were any spills or leaks at the site. This work was performed in 1947 prior to the 1950's, when the 313 Building was expanded in the northward direction over the site of the two tanks.

WIDS site UPR-300-38 is at the former site of the 313 building. The site 300-279 concerns soil contamination still under the building foundation. The 313 building was demolished in 2005. The foundation slab was left in-place with a layer of clean gravel placed over it (BHI-01781). Remediation of the UPR-300-38 waste site was performed from January 10, 2010, through June 2, 2011.

Closure Info: Interim

Confirmatory samples were collected from two trenches. They were excavated across the location of the suspected fuel tanks on April 4, 2012. Four grab samples per trench were taken along the base of each trench at 3.3 meters (10 ft) below ground surface (bgs). These locations correspond to the areas beneath the suspected fuel tanks. Due to field conditions, the northern section of trench number 2 was moved slightly westward compared to the design in the confirmatory work instruction. This was performed in order to avoid a concrete wall with rebar, which posed a safety concern. No additional debris was observed during sampling, and no sign of soil staining was noted. No asbestos-containing material was identified during field activities and, therefore, asbestos analysis was not performed.

The evaluation of sampling results indicated that environmental contamination warranting remediation was not present at this waste site. Based on confirmatory sampling at the 300-279 waste site, remedial action was determined to be unnecessary, and the confirmatory sampling data have been used to support reclassification of this waste site to Interim No Action.

Final

The 300-279, 3716 Automotive Repair Building Fuel Tanks waste site is part of the 300-FF-2 Operable Unit. This waste site consists of the historical location of underground diesel and gasoline storage tanks that were located to the north of the original 313 Building and east of the original 3716 Automotive Repair Building. Confirmatory sampling of the 300-279 waste site was performed on April 4, 2011.

The 300-279 waste site has been evaluated in accordance with the 300 Area Final Action ROD (EPA 2013) and the RDR/RAWP (DOE-RL 2014). Evaluation of previous confirmatory sampling results show that the concentrations of COC's meet the CUL's for direct exposure and groundwater protection and river protection and support a residential land use scenario. Institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the confirmatory sampling results support a reclassification of the 300-279 waste site to Final No Action.

<td></td>
</tr>
</tbody>
</table>
Closure Info: Interim

The 300-281 waste site was originally suspected to have an underground septic tank located about 72 meters (236 ft) north of the 3790 Building between the north end of the parking lot and the security fence surrounding the 325 Building. The suspected septic tank is shown on drawing H-3-45154 with a notation stating "Remove existing septic tank". However, the entire drawing was placed on hold for future construction of the Material Transfer Station facility. The facility was never constructed. It was unclear if the septic tank ever existed or was removed. Other documentation showed the septic system was to be built as part of the 300 area security upgrade project (V-711). The only reason to have installed a septic tank was to get around the new security systems that were to be installed in this area. Drawing M-3904 sheet 4 and H-3-23705 sheets 2 and 3 indicate a gap in coverage of the sewer system in the location of the planned in this area. Other buildings in the 300 area that were constructed at the time of the V-711 project are hooked up to the SNS system.

A geophysical investigation and confirmatory sampling activities confirmed that there was no septic tank at this location. Two test pits were hand excavated to an approximate depth of 1 meter (3 ft). An intact septic pipeline system was found. However, no septic tank was found nor was there any evidence of one having been there in the past. No radiological or volatile organic constituents were detected with field instruments. No stained soils or anomalous materials were observed. Based on this information, it was concluded that the 300-281 waste site would be reclassification to No Action on form 2012-035.

Final

A geophysical investigation and confirmatory sampling activities confirmed that there was no septic tank at this location. A test pit was hand excavated to an approximate depth of 1 meter (3 ft) below ground surface where an intact septic pipeline system was found. However, a septic tank was not found and there was no evidence that one had previously existed.

The 300-281 waste site has been evaluated in accordance with the Record of Decision for 300-FF-2 and 300-FF-5, and Record of Decision Amendment for 300-FF-1 (EPA 2013) and the Remedial Design Report/Remedial Action Work Plan for 300-FF-2 Soils (300 Area RDR/RAWP) (DOE-RL 2014). The test pit excavations during previous sampling showed an intact septic pipeline system with no indication that a septic tank had ever existed at this site. These findings support a residential land use scenario for the waste site. The 300-281 waste site did not extend into the deep zone; therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone of the site are not required. In accordance with this evaluation, the previous sampling observations support a reclassification of the 300-281 waste site to Final No Action.

</table>

Type: Trench
Status: Inactive
Start Date: 
End Date:

Description: The waste site has been evaluated and determined to require No Action. In 2014, the site was reclassified to Final No Action. It was an intentional release of contaminated water to soil in 1965. The area has been covered and used as an entry road and parking lot for 300 Area remediation activities.

Location: The exact location of the waste site is questionable. It is described as being located east of the 309 Building parking lot. The 300-283 potential site location is approximately 155 meters (508 ft) southeast of the 309 building, 157 meters (515 ft) south of the 324 building and 47 meters (154 ft) north of Cypress Street. An alternate location is described in sitecode 300-2. Drawing H-3-11002 gives the corner coordinates for the disposal area as a location 91 meters (300 ft) east of the original location described for 300-2.

Related Sites/Structures: This site is associated with 300-2, another potential location of the liquid disposal trench. 300-2 was evaluated and reclassified to No action in 2013.

Process Description:
On September 29, 1965, a major contamination event occurred at the 309 building, Plutonium Recycle Test Reactor (PRTR). A fuel element was heated until molten and a process tube burst. The event grossly contaminated the PRTR's heavy water moderator with fission products and with light water from the coolant. Most of the primary coolant and make-up coolant water was disposed via the 340 Building. Secondary coolant and other normally contamination-free streams were routed directly to the Columbia River. When contamination was detected in this stream, the water was pumped to the ground. About 189,250 liters (50,000 gallons) of liquid waste were disposed to the ground (WHC-MR-0388).

Subsequent investigation reported in the Final Investigative Report of Fuel Element Rupture Test Facility Incident, September 29, 1965 (BNW 1965) determined that contamination of the secondary coolant was caused by neutron activation of the secondary coolant water during the fuel element rupture. At no time did release of reactor material (transuranics or fission products) to the secondary coolant occur. The liquid disposed to the ground would have contained short-lived radionuclides of cerium, iodine, and noble gases and no transuranic material or fission products that would have decayed to be undetectable in the 46 years from 1965 to 2011.

Closure Info: Interim

The Final Investigative Report of Fuel Element Rupture Test Facility Incident, September 29, 1965 (BNW 1965) determined that contamination of the secondary coolant was caused by neutron activation of the secondary coolant water during the fuel element rupture. At no time did release of reactor material (transuranics or fission products) to the secondary coolant occur. The liquid disposed to the ground would have contained short-lived radionuclides of cerium, iodine, and noble gases and no transuranic material or fission products that would have decayed to be undetectable in the 46 years from 1965 to 2011.

Confirmatory sampling for the 300-283 waste site was conducted on April 26, 2012. One test pit was excavated. One focused sample and duplicate was taken at the bottom of the test pit at...
approximately 3.5 meters (10.5 ft) below ground surface. No additional debris was observed during sampling and no sign of soil staining was noted. No asbestos-containing material was identified during field activities, and therefore asbestos analysis was not performed. Samples were collected to support a determination that residual contaminant concentrations at this site meet the cleanup criteria specified in the RDR/RAWP (DOE/RL 2009) and the 300-FF-2 ROD (EPA 2001). The confirmatory sampling results support a reclassification of the 300-283 waste site to Interim No Action.

Final

The 300-283, Contaminated Light Water Disposal Site #2 waste site was a suspected liquid disposal area associated with the September 29, 1965, contamination event that occurred at the 309 Building, Plutonium Recycle Test Reactor (PRTR). Confirmatory samples were collected on April 26, 2012 at a depth of 3.5 meters (11.5 ft) below ground surface.

The 300-283 waste site has been evaluated in accordance with the 300 Area Final Action ROD (EPA 2013) and the 300 Area RDR/RAWP (DOE-RL 2014). Evaluation of previous sampling results show that the concentrations of COC’s meet the CUL’s for direct exposure and groundwater protection and river protection and support a residential land use scenario. Institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the confirmatory sampling results support a reclassification of the 300-283 waste site to Final No Action.

<tr>
<td>Description:</td>
<td>This site has been evaluated and determined to require No Action. In 2014, the site was reclassified to Final Closed Out. It consists of three individual french drain and drywell locations that were identified during the orphan sites evaluation process. It includes the underlying soil, and the associated below grade piping components. Each of the facilities that the French drains and drywells are associated with, were identified and process or function of the facilities determined. They are near the 309 Building exhaust filter pit, 3790 Badge House, and 3701-N Guardhouse.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Drain number 1 (FD-1) (Orphan site feature 300-FF2-019) is a 61 cm (24 in) diameter drywell constructed in accordance with Hanford standard AC-4-30 (H-3-14950 & H-3-14947). The drain received liquids from two 0.3 meter x 0.3 meter x 0.3 meter (1 ft x 1 ft x 1 ft) sumps located in the 309 Building exhaust filter pit. A 2.5 cm (1 in) schedule 40 steel drain line from each sump joined a (2 in) schedule 40 steel line that drained to the French drain. There is a locked metal cover over the drywell.

Drain number 2 (FD-28) is a stormwater catch basin and 4-inch slotted drain pipe (corrugated polyethylene with a smooth interior). It is not visible in the field.

Drain number 3 (FD-33) is a french drain with a 15.2-cm (6-inch) pipe that empties into it. The pipe was traced 11 meters due west using geophysics. The traced end of the pipe is 3 meters (10 feet) east of FD-21 (NFE), which was associated with the 3701-N guardhouse. Letter: MSA-1400080 (1/27/2014) Contract Deliverable CD1033 Annual Class V Underground Injection Control (UIC) Wells Update for calendar year 2013 states the estimated backfill date of this drain is 4/1/2012.
Location: Drain number 1 is located about 3.6 meters (12 feet) east of the 309 Building exhaust filter pit.

Drain number 2 is located on the east side of the 3790 Badge House.

Drain number 3 is located about 11 meters east-northeast of the 3701-N Guardhouse.

Process Description: There is a slight potential for contamination being present in drain number 1, as the 309 Building exhaust filter pit is associated the 309 building exhaust stack.

Drain number 2 received stormwater on the east side of the 3790 Badgehouse.

The source for water to drain number 3 is unknown, but thought to be from the 3701-N Guardhouse.

Closure Info: Interim

Confirmatory sampling for the 300-286 waste site was conducted on April 4, 2012. After the work instruction was issued, it was determined that Drain #1 would be removed during the 309 Building demolition. Therefore, confirmatory sampling at the Drain #1 location was not required.

The stormwater catch basin that comprises the Drain #2 location was adjacent to a light pole. A test pit excavation for sampling was not possible. Therefore, an evaluation of confirmatory sampling data for stormwater drains similar to Drain #2 (100-H-51:4 and 100-F-50) was conducted. Based on the confirmatory sample results from waste sites similar to the 300-286 Drain #2, the drain was not believed to pose a significant risk for direct exposure, groundwater protection, or river protection.

Confirmatory sampling was performed at Drain 3. The analytical results indicate that the residual concentrations of COPCs at this site meet the remedial action objectives for direct exposure, groundwater protection, and river protection. In accordance with this evaluation, the confirmatory sampling and modeling results support a reclassification of the 300-286 waste site to No Action.

Final

The 300-286, Three 300 Area Potentially Contaminated French Drain/Drywells waste site included three individual french drain and drywell locations, the underlying soil, and the associated below-grade piping components. The french drain and drywell locations were located near the 309 Building exhaust filter pit, 3790 Badge House, and 3701-N Guardhouse. The confirmatory sampling instructions directed sampling at each of the three french drains. After the work instruction was issued, it was determined that Drain #1 (near the 309 Building) would be removed during the 309 Building demolition; therefore, confirmatory sampling at the Drain #1 location was not required.

The stormwater catch basin that comprises the Drain #2 location (near the 3790 Badge House) was adjacent to a light pole, and test pit excavation and sampling was not possible. Therefore, an evaluation of confirmatory sampling data for stormwater drains similar to Drain #2 was conducted. The evaluation concluded that the drain did not pose a significant risk for direct exposure, groundwater protection, or river protection. Confirmatory sampling at Drain #3 (near the 3701-N Guardhouse) was conducted on April 4, 2012. The test pit at Drain # 3 was sampled at a maximum depth of 0.6 meters (2 ft) below ground surface.

The 300-286 waste site has been evaluated in accordance with the 300 Area Final Action ROD.
(EPA 2013) and the RDR/RAWP (DOE-RL 2014). Evaluation of previous sampling results and evaluations of similar waste sites show that the concentrations of COC's meet the CUL's for direct exposure and groundwater protection and river protection and support an industrial land use scenario. Because the sample results do not meet the CULs for residential land use, the waste site requires institutional controls to maintain industrial land use. In accordance with this evaluation, the previous sampling results support a reclassification of the 300-286 waste site to Final Closed Out.

### The SubSite is Part Of:
**Code:** 300-288
**Names:** 300-288; Disposal Sites Within Gravel Pit 6

| Code: 300-289 | Classification: Accepted |
| Names: 300-289; Stained Soil Area North of 300 Area | Reclassification: None |
| Type: Unplanned Release | Start Date: |
| Status: Inactive | End Date: |
| **Description:** This feature consists of bare ground, with crusting and two drum bung plugs. |
| **Location:** This feature is located 15 m west of a maintained power line road. |
| **Process Description:** There is no process history associated with this waste site. |

| Code: 300-290 | Classification: Accepted |
| Names: 300-290; Radiological Debris Area East of Horn Rapids Disposal Landfill | Reclassification: None |
| Type: Dumping Area | Start Date: |
| Status: Inactive | End Date: |
| **Description:** The site is a posted RMA (Radiological Materials Area) measuring approximately 64 square meters. The material in the RMA consists mostly of rusted metal automotive parts, scraps of crumpled sheet metal, electrical wire debris and engine gaskets. |
| **Location:** This site is located approximately 32 meters NNE of the NE boundary of WIDS site HRD (Horn Rapids Disposal) at coordinates E592787 N114636. |
| **Related Sites/Structures:** WIDS - HRD (Horn Rapids Disposal). |
| **Process Description:** The debris in this feature is consistent with the debris that was deposited in the Horn Rapids Landfill, which operated as an uncontrolled landfill from the late 1940's to the 1970's. The landfill is currently inactive, and was remediated in accordance with EPA/ROD/R10-93/063, Hanford 1100-Area (USDOE). The landfill has been taken off the National Priorities List, and it was capped and put under institutional controls (DOE/RL-2008-68). |

| Code: 300-291 | Classification: Accepted |
| Names: 300-291; Garnet Sand West of 350-A Paint Shop | Reclassification: Final No Action (12/15/2015) |
| Type: Dumping Area | Start Date: |
| Status: Inactive | End Date: |
| **Description:** The waste site was evaluated and determined to require No Action. It consists of garnet sand on a gravel road bed. |
| **Location:** This feature was located 60 meters west of the 350A paint shop. |
| **Related Sites/Structures:** This area likely supported the 350A paint shop. |
Process Description: Garnet sand was commonly used in grit-blasting operations to clean rust, paint, or contamination from the surface of metal components. The garnet sand material is not a hazardous substance, but there is potential for contamination from the surface material that was removed by grit blasting. Based on the location of the garnet sand being in close proximity to the 350A Paint Shop, it is likely the garnet sand was used to sandblast painted surfaces.

Closure Info: The garnet sand is no longer visible along the gravel/dirt roadway due to the installation of the pipeline; however, a small amount is present on a berm located on the north side of the roadway. A discrete grab in-process sample (J1TWJ8) consisting of garnet sand material and soil was collected from the berm area on June 24, 2014. The sample was collected to support a determination that residual contaminant concentrations at this site meet the cleanup levels specified in the 300 Area Final ROD (EPA 2013).

Code: 300-292 Classification: Accepted
Names: 300-292; 315 Water Filter Plant Waste Pipeline Segments Reclassification: Rejected (5/17/2012)
Type: Product Piping Start Date: End Date:
Status: Inactive
Description: This waste site has been evaluated and determined to be nonhazardous. It has been Reclassified to Rejected. The reclassification to Rejected is based on the evaluation and determination that coal ash and filter backwash waste solutions are nonhazardous waste and that the associated waste sites were previously designated as either No Action or Rejected.

This site includes ten (10) abandoned nonhazardous waste pipeline segments associated with the process sewers from the 315 Water Filter Plant (filter backwash) in the 300 Area. The site consists of abandoned pipeline segments and associated features (manholes, junction boxes, sumps, etc.) that transported filter backwash waste solutions from the 315 Water Filter Plant. These waste solutions were routed to Filter Backwash Ponds (e.g. 300 RFBP, 300 FBP:1, 300 FBP:2). The site includes pipeline segments identified during the 300-FF-1 Orphan Site Evaluation for disposition with the 300-FF-2 Operable Unit evaluations and additional undocumented pipeline segments, manholes, sumps and diversion boxes discovered during the 300-FF-2 Orphan Site Evaluation (OSE). The OSE reference number for these segments is 300FF2-266.

The original 315 Water Filter Plant process sewer ran east from the 315 Building process sewer sump (315-22) to an outfall into the Columbia River. In 1975, the 315 process sewer pipeline to the river outfall was isolated and sealed at a diversion box (315-23) installed to redirect the 315 Building process sewer flow north to discharge into on-site sedimentation ponds (see attached map and tables). The east branch of the 315 Water Filter Plant process sewer from the diversion box (315-23) was accepted as WIDS Waste Site 300-261; it was later closed out ("rejected") with Waste Site Reclassification Form 99-044.

The most recent waste site associated with these pipeline segments was the lined 300 FBP:2 Filter Backwash Pond (aka 315-C Sedimentation Pond) that was shutdown in 1998 (2000-116). During the last period of operation, any filter backwash waste solutions were to be settled in the pond and the pond overflow was to drain into a lift station for discharge to the 300 Area Process Sewer (300-15).

Location: These 315 Water Filter Plant filter backwash waste lines are located inside the 300 Area, northeast of the 324 building.

Related Sites/Structures: The pipelines included in this site are associated with the 315 Water Filter Plant, and the aqueous waste disposal facilities for these facilities including the 315-C Sedimentation Pond.
Process Description: The process waste solutions for this site included nonhazardous solids suspended in water filter backwash waste solutions from the 315 Water Filter Plant that were routed north to the 315-C Sedimentation Pond (300 FBP:2) where the filter backwash sediments settled.

Coal ash and filter backwash waste solutions were determined to be nonhazardous materials and the associated waste sites (pipelines, ditches, and ponds) were designated as either "No Action" or "Rejected" waste sites (DOE/RL-1994-49, DOE/RL-2004-74). These designations were confirmed during the Orphan Sites Evaluation for the 300-FF-1 Operable Unit completed in 2005 (120421).

Plans for the disposal of the settled filter backwash waste solutions in 300 FPB:2 progressed from 1990 to 1997 that involved: (1) a replacement river outfall pipeline (Segment 7) that was installed (1993) but not used, abandoned, and partially removed (1996), (2) a recycle line to the 315 Water Filter Plant for a 10% recycle process that was installed (1996) but not used and abandoned in place, and (3) pumps and piping installed in 1997 to transfer the waste water to the 300 Area process sewer (300-15) at a manhole (PS-47) near the 340 Facility west of the 315-C Sedimentation Pond. The latter included the reuse of some of the 300-295 pipeline segments.

Closure Info: None - The reclassification to Rejected is based on the evaluation and determination that coal ash and filter backwash waste solutions are nonhazardous waste and that the associated waste sites were previously designated as either No Action or Rejected.

</tr>
<tr>
<td>Description</td>
<td>The waste site has been evaluated and reclassified to No Action. In 2014, both subsites were reclassified to Final No Action so the parent site is also Final No Action. The site consists of miscellaneous piping in the 300 Area. The site was divided into two subsites: 300-293:1, 300 Area Miscellaneous Pipelines - less than 2.5 ft bgs and 300-293:2, 300 Area Miscellaneous Pipelines - greater than or equal to 2.5 ft bgs. Both subsites were reclassified to No Action, so the parent site is also considered No Action.</td>
</tr>
<tr>
<td>Location</td>
<td>The miscellaneous pipelines are located throughout the 300-FF-2 operable unit. The individual underground lines are mapped in the WCH Geographic Information System (GIS) database.</td>
</tr>
<tr>
<td>Closure Info</td>
<td>The 300-293:1, 300 Area Miscellaneous Pipelines Less Than 2.5 feet bgs waste subsite consists of 107 underground utility lines which are known to not be associated with hazardous waste because of their shallow depth. Pipelines with a depth of less than 0.76 meters (2.5 ft) bgs were determined not to have been associated with liquid waste processes or facilities that may have contained hazardous materials. The 300-293:2, 300 Area Miscellaneous Pipelines Greater Than or Equal to 2.5 feet bgs waste site, located in the 300-FF-2 Operable Unit, consisted of 171 segments of underground utility lines in the 300 Area. These lines were identified on duct bank plans used for electrical upgrades in the early 1990s, unidentified underground utilities from historic drawings, or objects found on subsurface scans. Some of these segments were previously removed by building demolitions or other waste site excavations. Those segments not previously known to contain hazardous materials.</td>
</tr>
</tbody>
</table>
have been removed were the target of previous investigation and sampling.

The 300-293:1 and 300-293:2 waste subsites have been evaluated in accordance with the Record of Decision for 300-FF-2 and 300-FF-5, and Record of Decision Amendment for 300-FF-1 (EPA 2013) and the Remedial Design Report/Remedial Action Work Plan for 300-FF-2 Soils (DOE-RL 2014). A review of the available information associated with the 300-293:1 subsite indicates that the pipelines would have contained telecommunications, electrical ductwork, and compressed gas lines. Because all of the lines that are less than 0.76 meters (2.5 ft) in depth, process knowledge indicates that the lines would not have contained liquid wastes or hazardous materials. These findings support a residential land use scenario for the waste site. The 300-293:1 nor 300-293:2 extended into the deep zone. Therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the results support a reclassification of the 300-293:1 and 300-293:2 subsites to Final No Action.

This Site has the Following SubSites:

**Code:** 300-293:1

**Names:** 300-293:1; 300 Area Miscellaneous Pipelines - Less Than 2.5 Feet Below Ground Surface

**Code:** 300-293:2

**Names:** 300-293:2; 300 Area Miscellaneous Pipelines - Greater Than or Equal to 2.5 Feet Below Ground Surface

Hanford Site Waste Management Units Report
February 2015
contained hazardous materials.

The 300-293:2, 300 Area Miscellaneous Pipelines Greater Than or Equal to 2.5 feet bgs waste site, located in the 300-FF-2 Operable Unit, consisted of 171 segments of underground utility lines in the 300 Area. These lines were identified on duct bank plans used for electrical upgrades in the early 1990s, unidentified underground utilities from historic drawings, or objects found on subsurface scans. Some of these segments were previously removed by building demolitions or other waste site excavations. Those segments not previously known to have been removed were the target of previous investigation and sampling.

The 300-293:1 and 300-293:2 waste subsites have been evaluated in accordance with the Record of Decision for 300-FF-2 and 300-FF-5, and Record of Decision Amendment for 300-FF-1 (EPA 2013) and the Remedial Design Report/Remedial Action Work Plan for 300-FF-2 Soils (DOE-RL 2014). A review of the available information associated with the 300-293:1 subsite indicates that the pipelines would have contained telecommunications, electrical ductwork, and compress gas lines. Because all of the lines that are less than 0.76 meters (2.5 ft) in depth, process knowledge indicates that the lines would not have contained liquid wastes or hazardous materials. These findings support a residential land use scenario for the waste site. The 300-293:1 nor 300-293:2 extended into the deep zone. Therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the results support a reclassification of the 300-293:1 and 300-293:2 subsites to Final No Action.

The UGLs without an approximate depth were also assigned to this subsite.</td>
<td>The miscellaneous pipelines are located throughout the 300-FF-2 operable unit. The individual UGLs are mapped in the WCH Geographic Information System (GIS) database and provided to the MSA Central Mapping group.</td>
<td>Interim</td>
</tr>
</tbody>
</table>

Some of the utility line segments were previously removed by building demolitions or other waste site excavations. Segments that were not previously known to be removed or investigated at the time of the confirmatory work instruction document approval were the target of confirmatory investigation. Confirmatory investigation was performed with field instrumentation. Screening results and observations indicate that the residual concentrations of COPCs at this site meet the RAGs for direct exposure, groundwater protection, and river protection. Only nine utility segments remained for evaluation.
The use of a vacuum truck excavator (Guzzler) was necessary to mitigate potential for affecting adjacent utilities at the 300-293:2 sampling locations. The vacuum truck contains all soil removed from a location and allows excavation to occur with less impact to adjacent utilities. Because this vacuum truck is regulated under for transport of radiological material, the soil from the confirmatory test pit and trench locations was staged in radiological buffer areas (RBAs) adjacent to each test pit/trench location. The soil was sent to the Environmental Restoration Disposal Facility (ERDF). Clean backfill was used to fill the test pits/trenches.

Test Trench 1 was excavated using the vacuum-truck Guzzler and hand digging on April 11 and 12, 2012. The three target utility segments were expected to be at a maximum of 1.5 meters (5 ft) below ground surface (bgs). The trench was excavated deeper than the 1.5 meters (5 ft) requirement, but the target segments were not found. One informational soil sample was collected from Test Trench 1. The utility segments targeted by Test Trench 2 were electrical duct banking and will be investigated during remediation of the waste sites adjacent to the 384 Building.

Test Pit 5 was excavated using the Guzzler on April 18, 2012. The excavation extended to the target depth of approximately 1.4 meters (4.5 ft) bgs, but no target utility segment was found. Test Pit 8 was excavated by hand digging (due to shallow depth) on April 18, 2012. The test pit was extended to 0.9 meters (3 ft) bgs in search of the target segment. There were small bits of single-strand copper wire, but no other indication of debris or the target segment. Radiological screening and organic vapor monitoring indicated background levels, therefore, no samples were collected. Test Pit 10 was excavated using the Guzzler on April 16, 2012. The test pit location was excavated to 1.2 meters (4 ft) bgs. The target segments were not found, so the test pit was expanded to the north. An adjacent north-south trending UGL was identified but it was not the target segment. Radiological screening and organic vapor monitoring indicated background levels, therefore, no samples were collected. Test Pit 21 was excavated using the Guzzler on April 16 and 17, 2012. The test pit uncovered a 7.6 cm (3-in.) rusty pipe at approximately 0.9 meters (3 ft) bgs. While the angle of the pipe matched that of the target segment, the diameter did not, and no additional investigation of this pipe occurred. Radiological screening and organic vapor monitoring indicated background levels, therefore, no samples were collected. Test Pit 21 was excavated using the Guzzler on April 16 and 17, 2012. The test pit uncovered a 7.6 cm (3-in.) rusty pipe at approximately 0.9 meters (3 ft) bgs. While the angle of the pipe matched that of the target segment, the diameter did not, and no additional investigation of this pipe occurred. Radiological screening and organic vapor monitoring indicated background levels, therefore, no samples were collected. Test Pit 24 was excavated using the Guzzler on April 19, 2012. Hard packed gravels and very minimal fines were found starting at approximately 1.1 meter (3.5 ft) bgs, resembling coarse fill. There was no indication of the target segment. Radiological screening and organic vapor monitoring indicated background levels, therefore, no samples were collected. Test Pit 28 contained live underground copper cable and/or polyline conduit within 1.5 meters (5 ft) of the utility segment. Therefore, the Test Pit 28 excavation in this location was deemed to be unsafe and was not dug. Test Pit 35 addressed a utility segment that had live underground power running perpendicular to the segment. This investigation in this location was also considered unsafe and was not dug.

The 300-293:2 subsite has been evaluated in accordance with the 300-FF-2 ROD (EPA 2001) and the RDR/RAWP (DOE-RL 2009). Confirmatory investigation was performed, and the field instrumentation screening results and observations indicate that the residual concentrations of COPCs at this site meet the RAGs for direct exposure, groundwater protection, and river protection. In accordance with this evaluation, the confirmatory investigation results support a
reclassification of the 300-293:2 subsite to No Action.

Final

The 300-293:1, 300 Area Miscellaneous Pipelines Less Than 2.5 feet bgs waste subsite consists of 107 underground utility lines which are known to not be associated with hazardous waste because of their shallow depth. Pipelines with a depth of less than 0.76 meters (2.5 ft) bgs were determined not to have been associated with liquid waste processes or facilities that may have contained hazardous materials.

The 300-293:2, 300 Area Miscellaneous Pipelines Greater Than or Equal to 2.5 feet bgs waste site, located in the 300-FF-2 Operable Unit, consisted of 171 segments of underground utility lines in the 300 Area. These lines were identified on duct bank plans used for electrical upgrades in the early 1990s, unidentified underground utilities from historic drawings, or objects found on subsurface scans. Some of these segments were previously removed by building demolitions or other waste site excavations. Those segments not previously known to have been removed were the target of previous investigation and sampling.

The 300-293:1 and 300-293:2 waste subsites have been evaluated in accordance with the Record of Decision for 300-FF-2 and 300-FF-5, and Record of Decision Amendment for 300-FF-1 (EPA 2013) and the Remedial Design Report/Remedial Action Work Plan for 300-FF-2 Soils (DOE-RL 2014). A review of the available information associated with the 300-293:1 subsite indicates that the pipelines would have contained telecommunications, electrical ductwork, and compress gas lines. Because all of the lines that are less than 0.76 meters (2.5 ft) in depth, process knowledge indicates that the lines would not have contained liquid wastes or hazardous materials. These findings support a residential land use scenario for the waste site. The 300-293:1 nor 300-293:2 extended into the deep zone. Therefore, institutional controls to prevent uncontrolled drilling or excavation into the deep zone are not required. In accordance with this evaluation, the results support a reclassification of the 300-293:1 and 300-293:2 subsites to Final No Action.

The SubSite is Part Of:

Code: 300-293
Names: 300-293; 300 Area Miscellaneous Pipelines

Code: 300-294
Names: 300-294; Garnet Sand East of 350 Building
Type: Dumping Area
Status: Inactive
Description: This feature consists of garnet sand on a gravel road bed.
Location: This feature is located approx. 5 m east of the 350 building.

Related Sites/Structures: The 350 Complex served as the central craft shop for the 300 area, with offices for supervisory and support personnel. The main 350 building contained shop areas for plastics, carpentry, electrical/instrument, machine, welding, grinding, and pipefitting/millwright work. As of 1984, approximately 70 personnel worked either in or out of the facility providing service and craft functions. The 350-A building provided space for spray-painting and sandblasting. The 350-B building was used to store miscellaneous equipment and supplies. The 350-C building functioned as a storage building for lumber used by the various shops. The 350-D building served as a storage location for hazardous chemicals, primarily oil (350, RCC SIS Report).
This waste site has been evaluated and determined to be nonhazardous. It has been Reclassified to Rejected. The reclassification to Rejected is based on the evaluation and determination that coal ash solutions are nonhazardous waste and that the associated waste sites were previously designated as either No Action or Rejected.

This site includes four (4) abandoned nonhazardous waste pipeline segments and associated features (diversion valve box, manholes, etc.) that serviced the 384 Power House coal ash waste disposal by sluicing to the 300 Ash Pits and/or to the 315-C Sedimentation Pond. The site includes pipeline segments identified during the 300-FF-1 Orphan Site Evaluation for disposition with the 300-FF-2 Operable Unit evaluations and additional undocumented pipeline segments discovered during the 300-FF-2 Orphan Site Evaluation (OSE).

The coal ash waste site (300 Ash Pit) associated with these pipeline segments was reclassified to a status of "No Action" based on the past practice knowledge (DOE/RL-94-49) that the waste streams were nonhazardous and based on post-remediation characterization results for the 300-FF-1 Operable Unit waste sites (CVP 2003-02, DOE/RL-2004-74).

The most recent waste site associated with these pipeline segments was the lined 300 FBP:2 Filter Backwash Pond (aka 315-C Sedimentation Pond) that was shutdown in 1998. No coal ash slurries were routed to the 315 C Filter Backwash Sedimentation Pond (300 FBP:2) via Segment 14, the most recent coal ash sluicing pipeline (see Site Comments). This site is listed as 300FF2-269 in the Orphan Sites Evaluation Report (OSR-2010-0002).

Location: The 384 Power House coal ash waste lines within the 300 Area were mapped in the WCH Geographic Information System (GIS) database.

Related Sites/Structures: The pipelines were identified in the WIDS as part of the 300 Area Process Sewer waste site, 300-15. They were associated with the 384 Power House, the 300 Ash Pits, and the 315 Sedimentation Pond; these pipelines were not connected to the 300-15 waste site piping.

Process Description: Water was used to slurry coal ash from the 384 Power House coal ash (aka fly ash) filters to the 300 Ash Pits via a 10 cm (8 in) diameter pipeline to one of the two 300 Ash Pits. The initial coal ash sluicing pipeline (Segment 10) discharged into an open ditch (Segment 11) that drained into the 300 Ash Pits. The subsequent replacement coal ash pipelines (Segments 12 and 13) discharged alternately into one of the two 300 Ash Pits. The 300 Ash Pits were used alternately to allow the water to drain and the accumulations of coal ash to dry before being excavated and disposed as a solid waste. The coal ash slurries were routed to the 300 Ash Pits until about 1995. In 1995, the 384 coal ash sluicing pipeline was extended (segment 14 part of WIDS site 300-292) to the 315-C Sedimentation Pond.

(300 FBP:2) to support plans to discontinue use of the 300 Ash Pits (H-3-49874). However, before the extended coal ash sluicing line (H-3-49874) was put into service, the coal-fired boilers at the 384 Power House were shut down to reduce stack emissions. No coal ash slurries were routed to the 315-C Filter Backwash Sedimentation Pond (300 FPB:2). However, while Segment 14 was not used for coal ash sluicing, it was used to transfer filter backwash waste solution from the 315-C Sedimentation Pond to the 300 Area Process Sewer (see 315 Miscellaneous Waste Pipelines, 300-292).

Coal ash was determined to be a nonhazardous material and the associated waste sites

---

**Code:** 300-295  
**Classification:** Accepted  
**Names:** 300-295; 384 Powerhouse Coal Ash Waste Pipeline Segments  
**Reclassification:** Rejected (5/17/2012)  
**Type:** Product Piping  
**Status:** Inactive  
**Start Date:**  
**End Date:**
(pipelines and ditch) were designated as "No Action" waste sites (DOE/RL-1994-49, DOE/RL-2004-74). This designation was confirmed during the Orphan Sites Evaluation for the 300-FF-1 Operable Unit completed in 2005 (120421).

**Closure Info:** None - The reclassification to Rejected is based on the evaluation and determination that coal ash solutions are nonhazardous waste and that the associated waste sites were previously designated as either No Action or Rejected.

**Code:** 300-296  
**Names:** 300-296; Soil Contamination Under the 324 Building B-Cell  
**Type:** Unplanned Release  
**Status:** Inactive  
**Classification:** Accepted  
**Reclassification:** None  
**Start Date:**  
**End Date:**

**Description:** The site consists of high dose rate contaminated soil beneath the B-Cell of the 324 Building. The lateral and vertical extent of contamination is unknown. The B-Cell was 7.6 meters (25 ft) x 6.7 meters (22 ft) x 9.3 meters (30.5 ft) high. The floor and walls (up to 8.2 meters [27 ft] high) were lined with stainless steel (H-3-20195, H-3-20213, H-3-20214 and H-3-20273). The floor sloped to a trench that ran the length of the east side of the cell. The trench emptied into a sump located in the northeast corner of B-Cell (H-3-20195).

**Location:** The site is located beneath the B-Cell in the north central portion of the 324 Building.

**Release Description:** On 11/16/10, a cone penetrometer (an enclosed pipe pushed into the soil by a hydraulic ram) was used to identify the presence of radioactive material in the soil approximately 3.5 feet beneath the 324 Building near the B-cell. A maximum radiation readings of 6,700 R/hr. was identified. The 324 Building is a Nuclear Category 2 facility, currently undergoing deactivation and decommissioning. The 324 Building was constructed in the 1960s to support materials and chemical process research and development activities, and ceased research operations in 1996. The primary operational system remaining in the building is ventilation. In preparation for removal of B-cell, historical research and on-site investigation identified evidence of a potentially breached liner in the sump floor. A leak may have occurred at some point in the operational past of the cell. The 300 Area is posted as an Underground Radioactive Material (URM) Area. This event is being reported as a Management Concern due to the unexpected very high levels of radiation.

**Related Sites/Structures:** The site is associated with the Radiochemical Engineering Cells (REC) area located in the north portion of the 324 Building.

**Process Description:** The 324 Building was constructed between 1964 and 1966 to demonstrate pilot scale processes for converting high level solvent extraction separations plant wastes to solids (HW-74703). The building was divided into five functional areas (BNWL-CC-2028): Radiochemical Engineering Cells (REC), Shielded Materials Facility, Sodium Studies Facility, Engineering Development Laboratory and the Engineering Development Laboratory.

The 300-296 waste site is related to the REC functional area. The REC area is located in the north portion of the 324 Building and consisted of four hot-cells (A, B, C, and D) located around a central airlock. The cells and airlock were joined forming a "T"-shaped structure. The airlock was used primarily as a transition zone for maintenance, decontamination, and transfer of material and equipment into and out of adjoining hot cells (PNL-10890).

The REC area was used for process and equipment development studies using materials with mega curie radioactive levels. All work was accomplished with remote manipulations from the service gallery (BNWL-CC-2028). Major research and development programs undertaken in the REC have included the Waste Solidification Engineering Prototypes (WSEP) Program, the...
Fabrication of Cesium and Strontium Heat and Radiation Sources Program (Federal Republic of Germany [FRG]), the Nuclear Waste Vitrification Program (NWVP), the Zeolite Vitrification Demonstration Program (ZVDP), and the Nuclear Waste Treatment Program's (NWTP) Pilot Scale Radioactive Liquid-Fed Ceramic Melter (RLFCM) Testing Task (PNL-10890). The REC operations were concluded in 1996.

**Description:**
In 2013, the reclassification was changed to Rejected. When the 4843 building TSD was Closed Out in 1997, WIDS site code 400-36 was created, at the request of EPA, to track the building's use as a waste transfer station. Building 4843 was reassigned from Fast Flux Test Facility (FFTF) Project to DynCorp Tri-Cities Services, Inc. (DYN), Transportation Operations for use as a temporary transfer station. Upon completion of DynCorp's contract in October of 2001, the transfer station was operated by Fluor Hanford, Inc., Hanford Site Operations. The transfer station operations have ceased. The last load of garbage delivered to the building was on July 31, 2002. Subsequent to cessation of operations, the floor area was surveyed. Direct and removable contamination surveys verified no source term material is present above background levels. The Washington Department of Health approved closure of the facility as an emission unit on October 15, 2002.

**Location:**
The 4843 Building is located in the northwest corner of the 400 Area. A large laydown area is located adjacent to and west of the structure.

**Related Sites/Structures:**
This building was previously known in WIDS as sitecode 4843; 4843 Building, 4843 Alkali Metal Storage Facility, a RCRA Treatment, Storage, and Disposal Facility. When this site was Closed Out under RCRA in 1997, WIDS site code 400-36 was created at the request of EPA to track the building's use as a waste transfer station.

**Process Description:**
The building was used as a transfer station to check Hanford garbage (sanitary waste) for radiological or hazardous contaminants prior to transporting the garbage to the Richland Landfill for final disposal.

**Waste Type:**
Process Effluent

**Waste Description:**
The building was used as a transfer station to check Hanford garbage (sanitary waste) for radiological or hazardous contaminants prior to transporting the garbage to the Richland Landfill for final disposal.

**Closure Info:**
The transfer station operations have ceased. The last load of garbage delivered to the building was on July 31, 2002. Subsequent to cessation of operations, the floor area was surveyed. Direct and removable contamination surveys verified no source term material is present above background levels.

The reclassification to No Action is documented on form 2004-102.

The reclassification to Rejected is documented on form 2013-107.
Rev. 24

DOE/RL-88-30

Reclassification: None

Type: Unplanned Release

Status: Inactive

Description: The 4723 Building has been demolished. Asphalt currently covers the area where the spills occurred. In April 2010, no visual evidence of the 4723 building or the storage areas could be found.

Location: The soil stains are located between the FMEF perimeter fence and the FFTF exclusion area fence.

Process Description: In 1979 and 1980, the 4723 building stored flammable liquids. Historical photographs show a bermed area outside the building and many container being stored outside the building. The 4843 Alkali Metal Storage Facility was built and actively began to store dangerous and mixed alkali metal waste in 1986. This building replaced the 4723 building.

Names: 400-41; 4723 Flammable Liquid Storage Building Soil Stains; 400 Area Flammable Liquid Storage Area Soil Stains

400-42; Demolished 4722-A Building Slab; Legacy Asbestos Site

Type: Dumping Area

Status: Inactive

Description: The waste site is the concrete slab remaining after the demolition of the 4722-A building. There is visible evidence of scattered Cement Asbestos Board (CAB) on the surface of the concrete slab and in the gravel surrounding the slab. It is currently surrounded with T Posts and red boundary tape. It is posted with Danger - Asbestos, Authorized Personnel Only signs.

Location: The 4722-A Building was located west of the 4760 building. It approximately 195 meters (640 ft) southwest of the 405 Reactor Containment Building.

Related Sites/Structures: The 4722-A building was associated with fuel tank 400-38.

Process Description: The 4722-A Building was used to provide space for fabricating and assembling piping and mechanical parts in support of construction at the FFTF site through 1984. It contained space for pipe fabrication and modification, instrument fabrication, storage, and offices.

Code: 400-42

Classification: Accepted

600-58

Classification: Accepted

Type: French Drain

Status: Inactive

Description: The oil/water separator is located south of the fuel island and south of the maintenance headquarters building. The oil/water separator receives drainage from eight floor drains in the maintenance headquarters building shop and two drains located on either side of the fuel island. The oil/water separator is designed to remove petroleum, oil, and lubricants from incoming water. It has a 454 liter (120 gallon) capacity. Drainage from the separator as well as drainage from two catch basins south of the maintenance headquarters building, flow into the dry well.
south of the maintenance building. The oil-water separator is precast concrete with a bottom elevation of about 4.6 meters (15 feet) below the surface. A site visit on November 20, 1998 found the oil-water separator to be active. It contained water with a small amount of oil sheen floating on the surface. In 2012, the three drywells had been removed and covered with asphalt.

Location: The Ashe Substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Related Sites/Structures: The site is associated with the H.J. Ashe Substation (Sitecode 600-60).

Process Description: This substation is part of the Bonneville Power Administration main transmission grid, that conducts electrical power from the Columbia and Snake Rivers dams to five states (Washington, Oregon, Idaho, western Montana, and northern California). The BPA transmission grid is divided into four subareas. The substations on the Hanford Site are within the Snake River subarea. The substations use petroleum oil, primarily mineral oil, as insulation in electrical equipment. This includes transformers, coupling and potential devices, capacitors, circuit breakers, reclosers, voltage regulators, switches, and cable. Insulating oil is a highly refined, 10-weight petroleum oil with approximately 0.1 percent 2,6-di-tertbutyl-paracresol (an antioxidant known as BHT that is also used as a food additive) and varying amounts of polychlorinated biphensils (PCBs) to increase dielectric strength. All of the substations have above ground tanks of mineral oil, that is used as make-up oil for equipment maintenance of electrical equipment. Solvents are used for cleaning and degreasing operations. Once maintenance is completed, rags soaked in solvent and all personal protective clothing are to be placed in drums for transport to the generator storage area at the H. J. Ashe Substation. All equipment filled with mineral oil is regularly analyzed for PCB concentration. All untested and unmarked equipment is assumed to be PCB contaminated. Electrical equipment fluid is assumed to be PCB, if the manufacturer's manuals or nameplates do not identify the type of dielectric fluid in the equipment, or if the equipment is known to be PCB according to available information. Drainage from the oil-water separator located adjacent to the fuel island, and stormwater runoff intercepted by two catch basins located south of the maintenance building flow into a drywell located 76 meters (250 feet) south of the maintenance headquarters building. Two other drywells receive stormwater runoff from the blacktop paved areas of the Ashe Substation facility.

Waste Type: Steam Condensate
Waste Description: The oil/water separator has received petroleum, oil and lubricants.

Waste Type: Steam Condensate
Waste Description: The drywells received drainage from the oil/water separator. It is likely that water contained some petroleum products.

Code: 600-59 Classification: Accepted
Names: 600-59; BPA SWMU #12; Generator Storage Area Sump; H.J. Ashe Substation Storage Area Reclassification: None
Type: Storage Start Date: 1/1/1976
Status: Active End Date: 
Description: The storage facility is southwest of the maintenance headquarters building. The 6.1 meter (20 foot) by 4.6 meter (15 foot) generator storage area inside the Hazardous Waste Storage portion of the building has a double floor. The top flooring consists of a metal grate. The sub-floor is concrete with no outlet, that acts as a containment basin to catch any spill or release that might
occur. The concrete sub-floor is sloped. The low end is considered to be a sump. The sump has no outlet. The building is actively being used by the Bonneville Power Administration (BPA) for storage of waste drums.

Location: The substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Related Sites/Structures: The site is related to the H. J. Ashe Substation, maintenance headquarters, gas pumps, control house, and switch yards. (See WIDS Sites 600-60 and 600-58).

Process Description: If a spill occurred, it would collect in the low end of the sloped sub-floor. It would be soaked up and disposed of properly.

Waste Type: Process Effluent

Waste Description: Annual hazardous waste reports indicate that the following wastes are generated at the Ashe Substation, 1,1,1-Trichloroethane mixture, 1,1,1-Trichloroethane-contaminated soils, acetone waste mixture, spent photographic fluids, fixer, and developer, battery acid and fluid mixture, ferric chloride etching solution waste, methanol waste mixture (Karl Fisher reagent), pentachlorophenol and sodium pentachlorophenol, solvent compound-thinner waste, toluene-isopropanol with potassium hydroxide (titrating solution). All waste is taken to the generator storage area (SWMU #12). This unit is part of the Flammable, Herbicide, and Toxic Waste Storage Facility Building located southwest of the maintenance headquarters building. Hazardous wastes from maintenance activities at other substations are collected at this location.

Code: 600-60  Classification: Accepted
Names: 600-60; H.J. Ashe Substation Switchyard Facility  Reclassification: None
Type: Electrical Substation  Start Date: 1/1/1976
Status: Active  End Date:
Description: The H.J. Ashe Substation is an active, operating electrical switchyard facility. The H.J. Ashe Substation consists of two large structures, a control house and a maintenance building, and yard areas with smaller buildings used for dry chemical storage and a vehicle fuel station with two underground gasoline tanks. The substation was first energized on December 3, 1976. Structures and equipment include an oil-filled circuit breaker (28,766 liters [7,600 gallons]), two underground gasoline tanks (15,140 liters [4,000 gallons] each), four mineral oil storage tanks (18,925 liters [5,000 gallons]), hazardous waste, flammable materials, and herbicide storage building (455 kilograms [1,000 pounds]).

Location: The substation is located 0.5 miles northwest of and adjacent to the Energy Northwest property (formerly known as the Washington Public Power Supply System).

Release Description: Six insulating oil leaks were identified in the switch yard at Reactor #1 on 9-13-90 (C-phase), at CT4885 on 9-13-90 (B-phase), at Reactor #1 on 10-2-90 (I-428), PCB 0-1026 on 4-26-91 and at Reactor #2 on 11-20-90 and 2-20-91 (I-429). There no further documentation on these releases. No cleanup actions were listed. Note that sampling was performed at these areas.

Related Sites/Structures: There are two Solid Waste Management Units (SWMU) identified at the H. J. Ashe Substation. These are SWMU #12 (sitecode 600-59) - Hazardous and Flammable Storage Area, and SWMU #13 (Sitecode 600-58) Oil and Water Separator.

Process Description: The switching substation was built to supply electrical power produced by the Hanford Generating Plant to the Supply System's main electrical grid.

Waste Type: Process Effluent
Annual hazardous waste reports indicate that the following wastes are generated at the Ashe Substation, 1,1,1-Trichloroethane mixture, 1,1,1-Trichloroethane-contaminated soils, acetone waste mixture, spent photographic fluids, fixer, and developer, battery acid and fluid mixture, ferric chloride etching solution waste, methanol waste mixture (Karl Fisher reagent), pentachlorophenol and sodium pentachlorophenol, solvent compound-thinner waste, toluene-isopropanol with potassium hydroxide (titrating solution). Polychlorinated biphenyls (PCBs) are also a potential contaminant of concern at this site because of the releases of insulating oil (See Releases Section).

Reclassification: 600-117; 300 Area Treated Effluent Disposal Facility (TEDF); 310 Building

Names: 600-117; 300 Area Treated Effluent Disposal Facility (TEDF); 310 Building

Type: Process Unit/Plant

Status: Inactive

Description: The waste site evaluated Interim Closed Out in 2012. TPA-MP-14, Rev 2 states that buildings/facilities which do not contain a TSD unit shall not be documented in WIDS. This facility contained no TSD units and does not meet the TPA-MP-14 criteria. Therefore, the 600-117 waste site was reclassified as Rejected in 2013. The original definition of the waste site included the main treatment building (310 Building), three modular/mobile offices (MO443, MO744, MO745), two exterior Diversion Tanks, one exterior Equalization Tank, two exterior Clarifier Tanks, two drum storage areas and one chemical storage area. All the components are surrounded by a chain link fence. In May 2013, the waste site was redefined. The remaining portions of the original facility were reconfigured to accept process sewer effluent from the 325 laboratory operations. These active components became part of the 600-352-PL waste site.

The facility was deactivated in 2010. The 310 main treatment building (310 building) and two clarifier tanks (310-T-7A and B) were demolished in 2012. The chemical storage area, one drum storage area, MO-443 and MO-744 were removed. The primary effluent concrete sump, located approximately 12 feet below grade, was cleaned of debris and surveyed following demolition. The sump was found to be free of contamination and left in place.

Location: The facility address is 780 Uranium St. It is located 1.1 kilometers (0.7 miles) north of 300 Area on the east side of Route 4S and about 0.5 kilometers (0.3 miles) west of the Columbia River.

When this site was originally added to WIDS, it was considered to be located in the 600 Area. The site became part of the 300 Area because of a change to the 300 Area Boundary definition.

Related Sites/Structures: Facilities associated with 310 Facility TEDF (600-117) operations originally included the 342 Sump and Control Building, the 182-centimeter (72-inch) diversion manhole in the 300 Area, the transfer piping between the 342 sump and the TEDF (see sitecode 600-352-PL), generating facilities that are connected to the 300 Area process sewer, and the TEDF outfall and transfer pipeline (WIDS Site 600-210). These items were transitioned to the 300-15:1 subsite.

Process Description: The facility treated and disposed of non-hazardous/non-radioactive process sewer effluent from the 300 Area. Treatment included chemical precipitation, selective ion exchange, and UV/peroxide oxidation to destroy organics and cyanide. Pipeline 600-352-PL fed effluent to the facility. After treatment, the effluent was originally disposed of at a submerged, single-port outfall in the Columbia River (Site sitecode 600-210). After 2009, the effluent was returned to the Combined Sewer System via pipeline 300-15. Chemicals used to treat the process sewer discharge included hydrogen peroxide, sodium hydroxide, sulfuric acid, ferric chloride, and ion exchange resins.
The 310 building treated waste water of heavy metals, mercury, organics, and cyanide. After receiving the waste water from the 342 Waste Collection Sump/Lift Station, it was processed at 300 GPM sequentially through an iron co-precipitation system to remove heavy metals, an ion-exchange system to remove mercury, and a hydrogen peroxide/ultraviolet radiation system to destroy organics and cyanide. The primary process chemicals, stored in tanks just outside the east wall, included ferric chloride (6,000 gal. tank), sodium hydroxide (6,000 gal. tank), sulfuric acid (4,000 gal. tank), and hydrogen peroxide (1,000 gal. tank). The two clarifier tanks (T-7A and T-7B) were a part of the iron co-precipitation process. Following the addition of chemicals and a flocculant, the waste water was gravity-fed to the clarifiers where solids precipitated. Clarified waste water overflowed the tanks for further processing, and the solids were pumped to a filter press for dewatering and eventual disposal.

Waste Type: Steam Condensate

Waste Description: The 300 Area process sewer discharges via the 342 TEDF Sump to the 310 facility (300 Area TEDF). The wastes discharged to the process sewer is composed of metals, organics, and cyanide. The maximum flow rate the facility is design to accommodate is 1,200 liters per minute (300 gallons per minute). The expected flow rate is approximately 600 liters per minute (150 gallons per minute).

Closure Info: The above-grade demolition of the 310 TEDF was completed in October 2012. The below-grade demolition was completed in December 2012. The primary effluent concrete sump, located approximately 12 feet below grade, was cleaned of debris and surveyed following demolition. The sump was found to be free of contamination and left in place. In addition, a small portion of the 310 slab and clarifier tanks on the west side of the facility were left in place because of active utilities that remain in the area. The demolished area was backfilled to grade with clean fill and topped with washed round rock. The building debris from demolition was removed and disposed of at the Environmental Restoration Disposal Facility (ERDF).

Prior to facility demolition, hazardous material such as batteries, Freon, oil, light ballasts, and miscellaneous construction materials. In addition, anthracite filter beds, sulfuric acid, ferric chloride, and sodium hydroxide heels remaining in chemical feed tanks were removed. No asbestos containing materials (ACM) were found in the building during inspection. Beryllium and radiological surveys were also conducted. No contamination was identified. No anomalies or soil staining was observed.

The balance of the facility components remain operational and were left in place (see sitecode 600-352-PL).

Code: 600-187  Classification: Accepted
Names: 600-187; West Lake Honey Dump Station  Reclassification: None
Type: Dumping Area  Start Date:  End Date:
Status: Inactive  Description: The site is located in a depression and appears to have been under water as part of West Lake when it was larger. Vegetation in the area is thick and short except for the lowest areas where the soil is very silty and shows desiccation cracks on the surface. There was no visual evidence of sewage waste in the area.
Location: The site is located south of the western portion of Gable Mountain, at the north end of West Lake (216-N-8). The site is 0.9 kilometers (0.6 miles) east of Route 4 North. A well traveled dirt road leads to West Lake from Route 4 North, about 0.8 kilometers (0.5 miles) past milepost 1.
The water level in West Lake was affected by the water level in Gable Mountain Pond.

**Related Sites/Structures:**

**Code:** 600-235  
**Classification:** Accepted  
**Names:** 600-235; Buried Lead Sheathed Telephone Cables  
**Reclassification:** Interim No Action (3/9/2005)  
**Type:** Dumping Area  
**Start Date:** 1/1/1943  
**Status:** Inactive  
**End Date:**

**Description:** The waste site has been evaluated and determined to require No Action. This site includes buried, inactive lead-sheathed telephone cable that was abandoned in place when the Integrated Voice Data Telephone System (IVDTS) was installed in 1988 by U. S. West. This system installed new telephone equipment in most buildings and installed new telephone switching facilities. In some cases the IVDTS reused portions of the old lead sheathed cables. The lead-sheathed cables were buried at a depth of 61 to 91 centimeters (24 to 36 inches). Approximately 483 kilometers (300 miles) of telephone cable was used at Hanford. Approximately fifty percent was buried and the reminder was over head lines. It is estimated that 204 kilometers (127 miles) of cable is buried at Hanford. The cables contain lead and will be required to be handled as dangerous waste if removed as part of an excavation or construction activity.

**Location:** The buried cables are located throughout the Hanford site.

**Process Description:** Beginning in the 1940's, the US Army began installing communication systems across the Hanford project property. The switching centers were originally tied together with lead sheathed cables. As communication systems have evolved over the years, many of the old switching centers were removed. In some cases, the old lines were reused, but in many cases the lead sheathed cables were abandoned in place. Lead-sheathed aerial cable lines ran from the 702-Central Telephone Exchange Building at Richland to switchboards housed in the 1720 Patrol Headquarters in the 100 B, D and F Areas and to the 704 Supervisor's Office Buildings in the 200 East and West Areas, and Building 3706 in the 300 Area, with interconnecting trunk lines between the 100 and 200 Process Areas. Details of the cable sizes have been documented in previous reports. No information has been located indicating underground telephone cables on the North Slope.

**Waste Type:** Ash  
**Waste Description:** The lead in the cable is considered hazardous but not the cable itself.

**Closure Info:** Approximately 204 kilometers (127 miles) of buried, lead-sheathed telecommunications cable has been left in place at the Hanford Site. Of concern is the disposition of this cable (Waste Information Data System [WIDS] site 600-235, Lead Sheathed Telephone Cables), and whether the lead present in the buried cable poses a risk to human health or the environment if left in place.

On September 15, 2003, representatives of the U.S. Department of Energy, Richland Operations Office (RL), the U.S. Environmental Protection Agency (EPA), and the Environmental Restoration Contractor (ERC) performed a field inspection at several buried lead-sheathed cable locations. Six candidate sites representing a variety of environmental conditions were selected for sampling to determine if releases of lead to the soil surrounding the lead-sheathed cable have occurred at levels that pose a risk to human health or the environment.

**Code:** 600-257  
**Classification:** Accepted
**Names:** 600-257; 213-J Magazine Waste Storage Cavern; 213-J Vault; 213-J&K Storage Facility  
**Reclassification:** Interim Closed Out (7/19/2011)

**Type:** Storage  
**Start Date:** 1/1/1944

**Status:** Inactive  
**End Date:**

**Description:** Sitecode 600-257, refers to the 213-J Vault. The 213-K Vault is described in sitecode 600-108. Both vaults have been remediated and Interim Closed Out.

The 213 facility (213-J and 213-K) was constructed into the south side of the base of Gable Mountain. The vaults are two parallel reinforced concrete, earth covered storage facilities. The south end of each vault forms a continuous reinforced concrete wing-shaped retaining wall with an attached reinforced concrete loading platform. The distance between the two vaults is 13.6 meters (44.5 feet). Each vault contains three rooms: magazine, vestibule, and instrument room. There are two outside, steel-hinged doors opening onto the loading platform. An inner steel vault door separates the vestibule from the magazine. The 213-J Vault is the western vault (600-257). The 213-K Vault (site 600-108) is the eastern vault and is not part of site 600-257.

**Location:** The unit is located north of Route 11A, east of Gable Mountain Pond.

**Process Description:**

The vaults were originally built in 1944 to store containers of processed plutonium product. They were used only briefly for that purpose (1944-1947). The 213-J was more recently used by Pacific Northwest National Laboratory for storing uncontaminated soil samples from around the world for use in fallout studies by the Environmental Sciences Department. The samples were removed from the vault in March 2002 and remained empty until they were remediated.

**Waste Type:** Chemicals

**Waste Description:** The vaults were constructed for storage of Hanford plutonium and were used only briefly for that purpose. No smearable radioactivity or radiation above background was detected inside the 213-J Vault in 1981. 213-J was used by Pacific Northwest National Laboratory (PNNL) to store uncontaminated soil samples collected from around the world from a fallout study. In March 2002, PNNL removed the soil samples from the 213-J Vault. The vault is now empty.

**Closure Info:**

The vaults were used for storage of processed plutonium from 1944 to 1947, and were surrounded by a barbed wire fence and guard tower, both of which are no longer present. Processed plutonium product and waste were sent to the vaults in boxes. The 213-K Vault had also been used to store drums containing equipment that had been contaminated with radioactive sodium. All contaminated materials have been removed from the 213-K Vault, and it was empty prior to the initiation of remedial activities. The 213-J Vault was used in more recent years to store uncontaminated soil samples for use in fallout studies. These soil samples were removed from the vault in March 2002 in the process of emptying the vault. A waste site walkdown was performed on January 9, 2001, to verify that nothing was stored inside the 213-K Vault. The vault was empty and no radiological postings were found. An additional site walkdown was performed on May 1, 2003, at which time the fan room between the two vaults was assessed. Transite and other potential asbestos containing materials were used in construction of the fan room and in the construction of a fire-safe door in the interior of the vaults. The wood of the fan room building roof was found to be rotting and caving in. A 189-L (50-gal) condensate collection tank was found inside the fan room that may have been connected to the outside condensate piping seen on geophysical surveys of the area. No radiological readings were found in the floor drain or elsewhere in the fan room building.

The 600-108 and 600-257 waste sites were remediated together and documented in the RSVP-2011-051. The vaults were split into two sitecodes in June 1999 to accommodate multiple...
contractor responsibilities.

Remedial action at the sites began on November 8, 2010, and was completed on January 20, 2011. A small oil spill near the vault entrance was assessed. Concrete and other debris were stockpiled prior to removal from the 600-108 excavation for shipment and disposal to the Environmental Restoration Disposal Facility. The overburden soils that surrounded the vaults were stockpiled adjacent to the waste site and will be used to re-contour Gable Mountain to its pre-Hanford conditions. The foundation of the vaults was removed entirely, to a depth of approximately 1 to 2 meters (3 to 6 ft) at the base.

On December 9, 2010, an oil reservoir was found in the fan room at the 600-108 waste site, and a small amount of oil was released to the ground just south of the vault entrance. Most of this oil spilled onto a concrete slab that was subsequently removed; however, a small amount may have leaked under the wall into the area where the vaults were located. In-process samples were collected from this oil spill. The spilled oil was staged on Griflon to the south of the excavated area.

<tr>
<td>Status: Inactive</td>
<td>End Date: 1/1/1998</td>
</tr>
<tr>
<td>Description: The site consists of the railroad track system on the Hanford site (beginning at Horn Rapids road and proceeding North). The section from Horn Rapids Road to Energy Northwest is still active. The rest is inactive. This site does not include any radioactive unplanned releases that may have effected portions of the track during Hanford operations. The documented radioactive releases are separate WIDS entries.</td>
<td></td>
</tr>
<tr>
<td>Location: The Hanford railroad track system extends from the north side of the Horn Rapids road right-of-way to each operating area of the site, and includes railroad spurs, sidings and junctions.</td>
<td></td>
</tr>
<tr>
<td>Process Description: The railroad was used to move supplies, equipment and reactor fuel around the Hanford site. Coal was delivered to the coal fired steam generating plants by rail car. Large pieces of equipment (pumps and centrifuges) needed to operate the canyon separations facilities and tank farm activities were transported on rail cars. Large burial containers of contaminated waste were removed from the canyon buildings, placed on flat bed rail cars and transported to specific burial trenches with railroad access. Oversight of the railroad between Horn Rapids Road and the Energy Northwest switch (except for the 300 lead) is the responsibility of the Port of Benton (POB), under DOE-RL ownership. Fluor Hanford retains oversight of the other sections of the railroad not included as part of facilities (Tank Farms, PUREX, PFP, N Reactor, etc.). This includes all mainline, spurs, and track within the 200 Areas and the 300 Area that are outside plant or project boundaries.</td>

### DOE/RL-88-30

#### Rev. 24

**Code:** 600-270

**Classification:** Accepted

**Names:** 600-270; Horseshoe Landfill; Nike Missile Base

**Reclassification:** Deleted From NPL (12/5/2005)

**Type:** Dumping Area

**Start Date:** 1/1/1950

**End Date:** 1/1/1970

**Status:** Inactive

**Description:** The site is a former historical landfill that was deleted from the NPL in 1996. The site was part of a former Nike missile base consisting of structures which supported missile launch, control, and maintenance functions, living quarters for base personnel, and storage buildings for hazardous substances use in the maintenance of the facilities and missile operations. Post Closure sampling for pesticide contamination occurred between 1998 and 2003. Soil remediation was done between May and August 2005.

**Location:** The site was located on the Fitzner-Eberhardt Arid Lands Ecology Reserve, a.k.a., Arid Lands Ecology (ALE) Reserve. Further the site was located on the northeastern slope of Rattlesnake Mountain about 8 kilometers (5.0 miles) west of the intersection of Highways 240 and 225.

**Related Sites/Structures:** WIDS Sites 600-116, 600-270, and 600-271 are all related to Nike missile base operations on the Fitzner-Eberhardt Arid Lands Ecology Reserve.

**Process Description:** During the base's operation, missile maintenance included the use of solvents, fuels, acids, hydraulic fluid, and paints. All wastes generated during operations were disposed of in onsite landfills, or dumped nearby offsite.

**Waste Type:** Process Effluent

**Waste Description:** Suspected wastes included solvents, fuels, acids, hydraulic fluid, and paints. Contaminants sampled for were barium, chromium, lead, acetone, bis (2-ethylhexyl) phthalate, butylbenzylphthalate, diethylphthalate, di-n-butylphthalate, phenol, chlordane, DDT, DDE, DDD, Endosulfan B, Endrin, Methyloxychlor, gasoline, diesel, heavy oils, diesel. Based on the results from soil excavated at A-6, the original 16 contaminants (draft ROD) were expanded to include DDT, DDE, and DDD.

**Waste Type:** Process Effluent

**Waste Description:** The majority of the waste consisted of non-hazardous construction and demolition waste, scrap metal and lumber, empty bottles, cans and drums. A summary of the waste found in each of the 6 anomalous areas is described below. Horseshoe Landfill/A-1 - boulders were encountered at 1.2 meters (4 feet) below ground surface, otherwise there was no evidence of any buried wastes or disturbed soil. Horseshoe Landfill/A-2 - no evidence of any buried waste or disturbed soil was found. Horseshoe Landfill/A-3 - abundant surface metal debris, barb wire, miscellaneous scrap metal, miscellaneous building materials; no evidence of any buried wastes or disturbed soil. Horseshoe Landfill/A-4 - bottles, rusted metal debris, car parts, car chassis, car engine with oil pan missing, 7-208 liter (7-55 gallon) drums ripped open and partially collapsed (empty) were found. Horseshoe Landfill/A-5 - bottles, pieces of rusted metal, a few animal bones were found. Horseshoe Landfill/A-6 - no evidence of buried wastes or disturbed soil in three excavations on the west side of A-6 except for copper grounding wire found about 15 centimeters (6 inches) below ground surface. Sheet metal scrap, fence post, wood debris, 0.61 meter (2 foot) diameter washing machine washtub, abundant 2.54 centimeter (1 inch) diameter cable, cement blocks, bottles, metal scrap, 3 ripped and partially collapsed 208 liter (55 gallon) drums, car engine with oil pan missing, wire, some plastic/metal parts, 4-25.4 centimeter (4 10 inch) battery-type containers with screens.

**Closure Info:** Based on findings from similar landfills on the North Slope of the Hanford Site, EPA and Ecology required that limited characterization of the Horseshoe Landfill be carried out. Between July 5 and 12, 1994, Golder Associates (under contract to the USACE) conducted electromagnetic (EM) profiling, magnetics (MAG), and ground-penetrating radar (GPR)
surveys at the Horseshoe Landfill. The survey covered an area approximately 152 meters (500 feet) by 183 meters (600 feet). Anomalous EM zones were categorized as low to high depending on the deviation from background levels. Anomalous zones were identified as A-1 through A-6. Full excavation of each anomaly was only required when field screening indicated the possible presence of contaminants. In order to excavate for the presence or absence of hazardous material, each geophysical anomaly was excavated in longitudinal trenches, measuring .5 to 3 meters (5 to 10 feet) wide and 1 to 2 meters (3 to 7 feet) deep. Trenching activities for each disposal cell consisted of excavating, inventorying, and segregating any potentially hazardous materials.

Remediation began on May 17, 2005 and continued to August 24, 2005. Soil was excavated to a depth of 1.2 meters (4 feet) in the southern portion of the landfill. Approximately 4,935 BCM of soil was removed for disposal at the Environmental Restoration Disposal Facility. A combination of statistical sampling and judgmental sampling to verify the completeness of remediation was performed, and analytical results were shown to meet the cleanup objectives for direct exposure (1 mg/kg DDT) and ecological protection (0.75 mg/kg total DDT/DDT/DDDD). In accordance with this evaluation, the verification sampling results support that the remediation of the DDT contaminated soil has been acceptably performed as provided in EPA.

Excavated materials were screened visually and by field instruments. Field test kits were onsite and used for field screening when the presence of contaminated materials was suspected. Depending on the suspected presence of contaminated materials, soil samples were collected for offsite analysis. Contaminated materials found during the excavation and/or by screening methods were inventoried and segregated (by shovel or trackhoe). Large volumes of contaminated materials encountered during excavation were stockpiled near the excavation site on 6-mil visqueen and covered with hay-bale tarps.

Approximately 1911.5 cubic meters (2,500 cubic yards) of soil contaminated with the pesticide DDT and its breakdown products were discovered. These soils were shipped to the Chemical Waste Management hazardous waste landfill in Arlington, Oregon. No other contaminants were detected above regulatory cleanup levels.

Following cleanup actions, excavations were backfilled, compacted using nonhazardous materials and clean fill, and graded to original conditions.
During the base’s operation, missile maintenance included the use of solvents, fuels, acids, hydraulic fluid, and paints. All wastes generated during operations were disposed of in onsite landfills, or dumped nearby offsite.

Waste Type: Ash

Waste Description: The majority of the waste consisted of non-hazardous construction and demolition waste, scrap metal, lumber, empty bottles, and cans. Nike Missile Base Landfill/A1 - concrete blocks, bottles, wood, and metal debris. Nike Missile Base Landfill/A2 - surface debris; long metal U-bolts, sheet metal scrap, miscellaneous scrap metal. There was no evidence of any buried waste or disturbed soil. Nike Missile Base Landfill/A3 - There was no evidence of any buried waste or disturbed soil.

Closure Info: Based on findings from similar landfills on the North Slope of the Hanford Site, EPA and Ecology required a limited characterization of the Nike Missile Base be carried out.

A previous investigation occurred between July 5 and 12, 1994, by Golder Associates. They conducted electromagnetic (EM), magnetic (MAG), and ground-penetrating radar (GPR) surveys at the Nike Missile Base Landfill. Over an area of approximately 152 meters (500 feet) by 137 meters (450 feet), 9 separate Electromagnetic anomalies (EM) areas were identified. Anomalous EM zones were categorized as low to high. A total of three anomalies were excavated (8/17/1994 - 8/18/1994) at the Nike Missile Base Landfill. Anomalies removed included two high EM anomalies and one moderate EM anomaly. Anomalous zones were identified as A-1 through A-3. Full excavation of each anomaly was only required when field screening indicated the possible presence of contaminants. In order to excavate for the presence or absence of hazardous material, each anomaly was excavated in trenches measuring 1.5 to 3 meters (5 to 10 feet) wide and 1 to 2 meters (3 to 7 feet) deep. Trenching activities for each disposal cell consisted of excavating, inventorying, and segregating any potentially hazardous materials. Excavated materials were screened visually and by field instruments. Field test kits were onsite and used for field screening when the presence of contaminated materials was suspected. Depending on the suspected presence of contaminated materials, soil samples were collected for offsite analysis. Contaminated materials found during the excavation and/or by screening methods were inventoried and segregated (by shovel or trackhoe). Contaminated materials encountered during excavation were stockpiled near the excavation site on 6-mil plastic and covered with hay bale tarps. Following cleanup actions, excavations were backfilled with nonhazardous materials and clean fill, and graded to original conditions.

---

**Code:** 600-272
**Classification:** Accepted
**Reclassification:** None
**Names:** 600-272; Petroleum-Contaminated Borehole; Well 699-43-2
**Type:** Unplanned Release
**Status:** Inactive
**Start Date:**
**End Date:**

**Description:** The site is hydrocarbon contamination in well 699-43-2. Well 699-43-2 is a 16.8-centimeter (6-5/8-inch) diameter well with a 10-centimeter (4-inch) PVC liner. Limited information is available about well construction. This well is believed to have been drilled to a depth of 120 meters (390 feet) in 1980 to support geologic studies for reactor citing. The well is currently 103.4 meters (339 feet) deep. The depth to water is 9 meters (26 feet) below land surface. It is believed that the well is not screened to groundwater and is open at the bottom.

**Location:** The well is located in a remote part of the 600 area, approximately 1.5 miles south of the former Hanford townsite, and approximately 300 meters (1000 feet) from the nearest vehicle access. Well 699-43-2 is approximately 600 meters (2000 feet) from the Columbia River.
Waste Type: Chemicals

Waste Description: The waste is an oil/water matrix. A sample of the water in the well showed 4.5 milligrams/liter (mg/L) of total petroleum hydrocarbons, 12.3 mg/L of oil and grease, and about 360 mg/L (36,000 micrograms per liter) of unknown alkanes. The likely source is diesel fuels or kerosene type materials. The liquid waste matrix will designate as D001 due to its low flash point.

Release Description: While the source of hydrocarbons in well 699-43-2 is unknown, the lack of vehicle tracks adjacent to the well, and the determination that the hydrocarbons were diesel fuel or kerosene derived suggests that contamination may have occurred during drilling.

Classification: Not Accepted (Proposed)
Reclassification: None

Names: 600-273; Pile of Red Material at Riverland
Type: Dumping Area
Status: Inactive

Description: The site is a pile of red material about 1.4 meters (4.5 feet) high, 9 meters (30 feet) long, and 5 meters (15 feet) wide. The volume calculated by GPS is 113 cubic meters. The site is near the end of a long berm headed west from the old railroad maintenance yard at Riverlands. Patches of similar colored soil can be seen throughout the area. No vegetation is growing in the upper half of the pile, but cheatgrass and other weeds have established at the bottom, presumably where their roots can reach soil. A magnet will pick up some of the fine particles in the pile, suggesting that the material is a crushed iron ore.

Location: The site is at the far west end of the railroad maintenance facility, about 1.6 kilometers (1 mile) from Highway 24, and 150 meters (500 feet) north of the road to the Midway Substation. It is visible from the Midway Substation road.

Related Sites/Structures: This site is at the far west end of 600-101, the Riverland Rail Yard Maintenance Facility.

Waste Type: Soil

Waste Description: The pile appears to be a pile of iron ore dumped from a hopper car so the car could be worked on at the maintenance facility. Iron ore was used in making the concrete for reactors since it provided additional shielding. A similar mound of material was found at the 100 B/C Area. Samples were taken of that mound. The material at 100 B/C contained 48% iron, 1.5% chromium, and 0.2% aluminum.

Classification: Accepted

Names: 600-278; Bioremediation Pad Within Gravel Pit 9; Oil Contaminated Soil
Type: Surface Impoundment
Status: Inactive

Description: The waste site is bioremediation area located in the eastern section of Gravel Pit #9. It has been evaluated and Closed Out.

Location: Pit #9 is located approximately 1.2 kilometers (2 miles) north of 300 Area, east of Route 4S.

Related Sites/Structures: The site is associated with the 384 Day Tanks (300-223) and Gravel Pit #9 (600-246).
**Process Description:** In 1999, the petroleum contaminated soil was removed from around the 384 fuel oil day tanks and spread onto the ground inside Pit 9 to facilitate bioremediation of petroleum contained in the soil. In 2000, the bioremediation area had been posted as an Underground Radioactive Material Area and later a Soil Contamination Area. The posting was the result of the fact that the 300 Area is posted as an Underground Radioactive Material Area, so the removed soil was potentially contaminated. In June 2003, it was determined the radiological postings were not appropriate and were removed.

**Waste Type:** Process Effluent

**Waste Description:** The soil on the bio remediation pad was originally contaminated with petroleum (fuel oil #6 and diesel oil #2) from the excavation of the 384 Day Tanks (sitecode 300-223).

**Closure Info:** Soil samples were collected in September 2003 and analyzed for petroleum hydrocarbons to check the progress of the bioremediation. Results indicated the levels were below chapter 173-340 of the Washington Administrative Code (WAC) limits. The results were sent to Ecology by DOE/RL in a letter entitled "Completion of Corrective Action for Petroleum Contaminated Soil Associated with the 384 Powerhouse Day Tanks," dated March 1, 2004. Once Ecology confirms that the soil meets cleanup standards, the soil will be used for cover at the inert waste landfill located at Pit 9.

---

**Code:** 600-284-PL  
**Classification:** Accepted  
**Reclassification:** None

**Names:** 600-284-PL; Cross Site Transfer Pipeline; Lines V360, V361, V362, V363, V364 and V366; Old Cross Site Transfer Pipeline; Original Cross Site Transfer Pipeline; Piping Associated with UPR-600-20, Cross Site Transfer Line

**Type:** Encased Tank Farm Pipeline  
**Start Date:** 1/1/1952  
**End Date:** 1/1/1995

**Status:** Inactive

**Description:** The waste site is the underground pipeline that is located beneath the surface stabilized UPR-600-20 soil contamination site. It is posted with Underground Radioactive Material signs.

**Location:** The encased pipeline runs from 241-UX-154 Diversion Box, adjacent to 221-U inside 200 West Area, to the 241-ER-151 Diversion Box inside 200 East Area.

**Release Description:** The surface of the buried waste transfer line became contaminated through biological transport of radioactive materials that leaked in the pipeline encasement and windblown particulates from the vent station. In March 1988, while conducting a radiological survey of the 241-EW-151 Vent Station (located approximately mid way between 200 East and 200 West Areas on the transfer line) contamination was identified approximately 100 meters (300 feet) outside the established radiation zone boundaries of the vent station, above the transfer line. The Mobile Surface Contamination Monitor (MSCM) tractor was used to survey the entire surface of the pipeline. Numerous spots of contamination were identified at various locations along the entire length of the transfer line. Contamination levels ranged from a few hundred counts per minute to 750 millirem per hour. To characterize the integrity of the pipeline, eight boreholes were drilled with an auger at four locations along the transfer line. Although no contamination was found to have leaked below the pipeline encasement, contamination was found in sagebrush growing next to the encasement. This indicated that the roots of the sagebrush had penetrated the encasement. The contamination was given an Unplanned Release number UPR-600-20 in 1989.

**Related Sites/Structures:** The pipeline is associated with the 241-UX-154 Diversion Box, the 241-ER-151 Diversion Box, 241-EW-151 Vent Station and UPR-600-20.
The cross site transfer line was originally constructed in 1952 to support the Uranium Metal Recovery operations. Various process and tank farm waste has been transported between 200 East and 200 West areas through this underground concrete encased group of pipelines. The cross site transfer line consists of six stainless steel pipelines (V360, V361, V362, V363, V364, V366) inside a concrete encasement. The encasement type is known as 6-59, indicating there are six lines inside a 59 inch wide encasement. The concrete encased stainless steel pipelines are buried at depths that range from 1.5 to 4.5 meters (5 to 15 feet). Fifty eight encasement test risers (swab risers) were spaced regularly along the pipeline that provided access to the encasement void space. This cross site line was replaced with a new pipeline in 1995 (see 600-269).

The waste site is approximately a 4.5 meter (15 foot) diameter circle. The area contains five, 15 centimeter (6 inch) diameter, polyvinyl chloride shafts, one 7.6 centimeter (3 inch) diameter PVC soil moisture access port and one 5 centimeter (2 inch) diameter PVC instrument access shaft. The shafts are set in the ground to a depth of approximately 9 meters (30 feet). Only a few inches of each PVC pipe casing is visible above the ground surface.

The site consists of scattered empty containers for hazardous materials.

The site consisted of a diesel fuel leak near the northwest corner of Building 623A, located on Rattlesnake Mountain. The leaking fitting on a diesel fuel return line from an emergency power generator was discovered on September 11, 2008. It was repaired September 12, 2008. The leak resulted in an affected surface area of approximately 0.61 meters to 0.91 meters (2-3 feet) wide.
Location: The release was located between a diesel tank and the building, near the northwest corner of Building 623A (Plant Radio Relay Bldg on top of Rattlesnake Mountain).

Release Description: During a routine visit of the 623A building on September 11, 2008, an area of discolored soil was discovered on the west side of the building. Further investigation noted that fittings from the emergency back-up generator near the building had leaked approximately 20 gallons of fuel onto the ground. The leak was in a previously disturbed area. Proper notifications were made and the leaking fittings were repaired on September 12, 2008. Soil excavation was conducted between September 18, 2008 and October 28, 2008. Samples were collected on October 8, October 28, 2008 and November 25, 2008.

Related Sites/Structures: The spill was associated with the 623A building.

Waste Type: Process Effluent

Waste Description: Diesel fuel oil (number 2) released to the ground via a leaking pipe fitting.

Closure Info: Excavation of the diesel contaminated soil began on September 18, 2008. Characterization samples were collected as composites from the bottom of the excavation, as well as from the front, left, and right faces of the excavation, as you face the building (COC 100808). Waste characterization sampling and analysis was conducted using EPA SW-846 Method 8260 for volatile organic contaminants by gas chromatography and mass spectrometry.

During a routine visit of the 623A building on September 11, 2008, an area of discolored soil was discovered on the west side of the building. Further investigation noted that fittings from the emergency back-up generator near the building had leaked approximately 20 gallons of fuel onto the ground. The leak was in a previously disturbed area. Proper notifications were made and the leaking fittings were repaired on September 12, 2008. Soil excavation was conducted between September 18, 2008 and October 28, 2008. Samples were collected on October 8, October 28, 2008 and November 25, 2008.

A follow up excavation was done on October 8, 2008. Cleanup verification analysis was conducted using the NWTPH-DX method for diesel range organics in soil and water. The NWTPH-DX method adapts the Oregon Department of Environmental Quality TPH-D method; the Ecology WTPH-D method; and EPA SW-846 Methods 3510, 3540/3550, and 8000 for the qualitative and quantitative analysis of semi-volatile petroleum products using methylene chloride extraction followed by GC/Flame Ionization Detector (FID) analyses. All sample analyses were performed at WSCF. Clean-up verification sample results for the three "face" samples were all below the action level of 2000 mg/kg (130, 180, and 300 mg/kg TPH Diesel for the front, left, and right samples respectively). The sample taken at the bottom of the excavation had a result of 7100 mg/kg TPH Diesel and exceeded the initial action level. Therefore, additional excavation and verification sampling was planned. Based on the October 8, 2008 sample analysis results, Fluor Hanford concluded that the lateral extent of contamination had been bounded by the excavation.

An October 28, 2008 clean-up verification sample, taken from the bottom of the excavation, had a result of 8500 mg/kg TPH Diesel and also exceeded the initial action level. Therefore, additional excavation and verification sampling was planned prior to backfill. Samples were collected from locations where the highest concentrations were most likely to be found based on visual staining. This approach yielded information needed to reach conclusions about the vertical and lateral extent of contamination.
Based on the 11/25/08 sample analysis results, residual concentration of TPH at the spill site were less than 2000 ppm. Although subsurface detectable levels of contamination remain at the site, the residues do not pose a threat to ecological/terrestrial receptors. Moreover, natural attenuation and biodegradation processes have already been observed and will further decrease the potential for ecological/terrestrial receptor uptake/exposure. The cleanup verification samples have indicated that soil concentrations of toxic or carcinogenic constituents were either non-detectable or were below levels typically used by Ecology to ensure protection of human health and the environment.

---

**Code:** 600-349  
**Classification:** Accepted  
**Reclassification:** None  
**Names:** 600-349; Unexploded Ordnance (UXO) outside of 600-149  
**Type:** Dumping Area  
**Status:** Inactive  
**Description:** This site consists of potential Unexploded Ordnance (UXO) in an area bounded by the entire perimeter of the 600-149 waste site and extends from the perimeter to as far as a fired rifle grenade could travel. The area with the highest potential to contain munitions and explosives of concern includes a portion of Gable Mountain south of Prid Canal.  
**Location:** The waste site is located on the west side of the 600-149 waste site boundary.  
**Related Sites/Structures:** 600-349 is associated with sitecode 600-149, Small Arms Range, Rifle and Pistol Range.

---

**Code:** 600-350  
**Classification:** Accepted  
**Reclassification:** Interim Closed Out (9/14/2011)  
**Names:** 600-350; PNL Water Catchment Experiment  
**Type:** Experiment/Test Site  
**Status:** Inactive  
**Description:** This site has been remediated and Interim Closed Out. It consisted of two separate fenced areas containing linear soil mounds.  
**Location:** This feature is located approximately 700 meters northwest of the Hanford town site's former high school and 122 meters east of route 2N.  
**Process Description:** The Pacific Northwest Laboratory (PNL) constructed this site to perform rain harvesting experiments. The experiments were done to study the use of water harvesting (the collection and use of rainfall runoff) to restore the vegetative productivity of strip mined lands in arid regions. The study tested the technical and economic feasibility of using partially leveled spoil banks at strip mines as catchment areas to collect and direct runoff to the top soiled valley floor where crops were cultivated. The study was performed from 1976 through 1981 (PNL-4538). The site was modified with a small drag line to resemble the smoothed spoil banks of a coal mine; cobble alluvium of the Columbia River served as spoil. Seven areas were prepared, three with valleys that ran north to south, and three with valleys that ran east to west; one area was prepared without adjacent slopes to simulate leveled spoil banks. The north-south valleys were protected from the strongest winds in the region, while the east-west valleys were parallel with the strongest winds. The valleys were each 90 m (300 ft) long by 18 m (60 ft) wide at the top of the catchment areas ("spoil banks") and 4 m (13 ft) wide at the surface of the topsoil, with a 33° angle of repose for each slope. The runoff efficiency of the surface was evaluated by applying...
a pore filling or waterproofing substance to the surface of the spoil banks. Three materials (rubber sheeting, paraffin and asphalt-rubber) were used for slope treatments. The rubber sheeting was 1.59 mm (1/16 in.) thick EPDM (butyl rubber) installed in September 1976 in one NS valley. Paraffin (approximate melting point 53°C) was melted and sprayed at the rate of approximately 1 kg/m² on the cobbled catchment area of a NS valley in May of 1977 and on the smooth catchment area in an EW valley in September 1977. Asphalt-rubber, a mixture of ground rubber and asphalt, is used as a crack sealer on roadways and as a liner for reservoirs. This treatment was applied to catchment areas of an EW valley in September of 1977 at the rate of 4 to 8 l/m². Catchment (slope) treatments at Hanford included: Flat Control - NS oriented area with no adjacent slopes or catchment areas Rubber sheeting - NS valley with rubber sheeting on catchment area Asphalt-rubber - EW valley with asphalt-rubber on catchment area Paraffin NS - NS valley with paraffin on catchment area Paraffin EW - EW valley with paraffin on catchment area Bare surface NS - NS valley with no treatment on catchment area Bare surface EW - EW valley with no treatment on catchment area.

Closure Info: Remedial action at the 600-350 waste site took place from March 14 to April 4, 2011, and consisted of removing the asphalt coating from the "V"-shaped area between and on the sides of the mounds. The asphalt debris was directly loaded into containers for disposal at the Environmental Restoration Disposal Facility.

Based on observations during a March 2010 walkdown to support remedial action, it was determined that the asphalt material should be removed and the mounds flattened for aesthetic purposes.

Type: Process Sewer  
Start Date: 1/1/1994

Status: Inactive  
End Date: 1/1/2012

Description: In September 2013, the 600-352-PL waste site was Consolidated with the 300-15 Process Sewer waste site and is considered part of the 300-15:1 subsite. The waste site is the underground, 25 centimeter (10 inch) diameter high density polyethylene pipeline extending from the 342 sump and the 310 facility Retention/Transfer System (RTS) (see sitecode 600-117).

In May 2013, the 600-117 (310 Facility) waste site was redefined. Portions of the 310 facility were demolished and Interim Closed Out. The remaining, active portions of the original facility were reconfigured to accept process sewer effluent from the 325 laboratory operations. These active components became part of the 600-352-PL waste site. The active components include MO-745, one drum storage area, two diversion tanks and one equalization tank. The second drum storage area was converted to a truck unloading station. All of these components are now considered part of 300-15:1.

Location: The majority of the pipeline is located north of the 300 Area. It begins at the 342 waste collection sump and extends northward to the 310 Retention Storage (RTS) facility. It follows the abandoned rail spur and then parallels Stevens Drive.

Related Sites/Structures: The pipeline is associated with the 342 waste Collection Sump, the remaining active components of the 310 Facility, 300-15 process sewer and 600-117.

Process Description: The 300 Area Retention/Transfer System is a batch release operation. 300 Area effluent is pumped into the 300 Area Retention/Transfer System (RTS) via this pipeline and the 342 waste collection sump. The pipeline terminates at the 310 valve vault. The water is temporarily stored in one of three retention tanks located in the 310 facility complex. After being analyzed, the effluent below regulatory limits was originally returned to the 300 Area Process Sewer pipeline (see sitecode 300-15). Since becoming active in 1994, most of the facilities in the 300 Area have been demolished. In 2012, the 310 facility was reconfigured to accept process sewer effluent from the only the 325 laboratory operations. After 2012, the effluent below regulatory limits was originally returned to the Combined Sewer System (that is connected to the City of Richland Sewer). Any waste water that exceeds acceptable levels of contaminants is trucked to the 200 Area Effluent Treatment Facility (ETF) for processing.

This Site Was Consolidated With:
Code: 300-15
Names: 300-15; 300 Area Process Sewer System

Code: 600-353  
Classification: Accepted

Names: 600-353; Non-Operational Property Evaluation Zone 1, Areas of Distressed Vegetation and Oil Filter Debris  
Reclassification: None

Type: Dumping Area  
Start Date: 
End Date:

Status: Inactive

Description: During a Non-Operational Property Evaluation walkthrough, an area of concern was located south of Route 11A. One location containing deteriorating crushed oil filters was identified. Another location, west of the oil filters was found to be devoid of vegetation. Each location measured approximately 25 square feet.

Location: The area of concern is located northwest of 200 West Area, south of Route 11A. It is east of the intersection of Route 11A and Route 6.

This feature consists of a subsurface feature containing nine buried inert objects ranging from near surface to 4.2 meters below ground surface and two acoustic boreholes.

Location: The waste site is located approximately 873 meters west of 300 Area (Rt 4S and Cypress Ave) on the west side of Stevens Drive. It is near the 600-22 UFO Landing Site area.

Process Description: The site was used to test metal detectors on a variety of metal targets with a wide range of shapes and sizes.

Location: The waste site is located approximately 873 meters west of 300 Area (Rt 4S and Cypress Ave) on the west side of Stevens Drive. It is near the 600-22 UFO Landing Site area.

Process Description: The site was used to test metal detectors on a variety of metal targets with a wide range of shapes and sizes.

Location: The waste site is located approximately 873 meters west of 300 Area (Rt 4S and Cypress Ave) on the west side of Stevens Drive. It is near the 600-22 UFO Landing Site area.

Process Description: The site was used to test metal detectors on a variety of metal targets with a wide range of shapes and sizes.

Location: The waste site is located approximately 873 meters west of 300 Area (Rt 4S and Cypress Ave) on the west side of Stevens Drive. It is near the 600-22 UFO Landing Site area.

Process Description: The site was used to test metal detectors on a variety of metal targets with a wide range of shapes and sizes.
Status: Inactive

Description: The site has been remediated and Interim Closed Out. It consisted of a 15 square meter (157 square feet) area covered with green granules.

Location: The site was located 20 meters (66 ft) north of Route 1 and 440 meters (1,444 ft) west of Route 2 North at E579763.92/N145328.32. The feature was approximately 130 meters (427 ft) west of the Leazer rail spur.

Process Description: In 1944, temporary construction buildings were housed in this area. The area included several warehouses, the crane operators' loft, the riggers' loft and an ice house storage pit (C-3316, HAN-10970 Volume 2, pp. 347, 492 and 520). The Leazer Rail Spur was also known as the Pierce Siding (H-7-618). The Salvage/Scrap Yard (also described as being at Leazer Spur) was a kilometer south of the warehouses and operated as late as December 1948 (HW-12086, p. 192). It is not known what if any relationship existed between the two complexes.

Closure Info: Remediation of the 600-368 waste site occurred on March 28, 2013, and resulted in approximately 54 bank cubic meters (71 bank cubic yards) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). Remediation of the 600-369 waste site (including eight subsites) was performed from March 28 through May 6, 2013. Approximately 3,969 bank cubic meters (5,191 bank cubic yards) of excavated materials from the 600-369 waste site were removed and direct loaded for disposal at ERDF. The approximate depth of the 600-368 and 600-369 excavations is 0.5 to 1 meters (1.5 to 3.3 ft) below ground surface. All material removed from the 600-368 and 600-369 (and subsites) was direct loaded for disposal at ERDF. No soil staging pile areas or overburden areas were utilized.

Tree stumps and other farmstead debris indicated that the 600-369:4 had been located within a former farmstead orchard area.

Code: 600-369

Names: 600-369; Segment 4 Bare Ground and Crusted Soil Areas

Type: Dumping Area

Status: Inactive

Description: The parent site and all eight subsites have been remediated and Interim Closed Out. It consisted of eight areas near the Leazer Spur that were devoid of vegetation. The site was divided into eight subsites as follows:

600-369:1, Segment 4 Bare Ground and Crusted Soil Area 1
600-369:2, Segment 4 Bare Ground and Crusted Soil Area 2
600-369:3, Segment 4 Bare Ground and Crusted Soil Area 3
600-369:4, Segment 4 Bare Ground and Crusted Soil Area 4
600-369:5, Segment 4 Bare Ground and Crusted Soil Area 5
600-369:6, Segment 4 Bare Ground and Crusted Soil Area 6
600-369:7, Segment 4 Bare Ground and Crusted Soil Area 7
600-369:8, Segment 4 Bare Ground and Crusted Soil Area 8

Location: The 600-369 site was located on both sides of Route 1, west of Route 2 North.

600-369:1, Segment 4 Bare Ground and Crusted Soil Area 1 was located at E579937.3, N145487.63
600-369:2, Segment 4 Bare Ground and Crusted Soil Area 2 was located at E579803.50, N145380.74
600-369:3, Segment 4 Bare Ground and Crusted Soil Area 3 was located at E579812.38, N145204.89
600-369:4, Segment 4 Bare Ground and Crusted Soil Area 4 was located at E579736.30, N145178.74
600-369:5, Segment 4 Bare Ground and Crusted Soil Area 5 was located at E579952.40, N145351.86
600-369:6, Segment 4 Bare Ground and Crusted Soil Area 6 was located at E579633.55, N145336.17
600-369:7, Segment 4 Bare Ground and Crusted Soil Area 7 was located at E579895.23, N145368.72
600-369:8, Segment 4 Bare Ground and Crusted Soil Area 8 was located at E579698.99, N145413.13

Process Description: In 1944, temporary construction buildings were located in this area. The buildings included various warehouses, the crane operators' loft, the riggers' loft and an ice house storage pit (C-3316, HAN-10970 Volume 2, pp. 347, 492 and 520). The Leazer Rail Spur was also known as the Pierce Siding (H-7-618). The Salvage/Scrap Yard (also described as being at Leazer Spur) was a kilometer south of the warehouses and operated as late as December 1948 (HW-12086, p. 192). It is not known what if any relationship existed between the two complexes.

Closure Info: Remediation of the 600-368 waste site occurred on March 28, 2013, and resulted in approximately 54 bank cubic meters (71 bank cubic yards) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). Remediation of the 600-369 waste site (including eight subsites) was performed from March 28 through May 6, 2013. Approximately 3,969 bank cubic meters (5,191 bank cubic yards) of excavated materials from the 600-369 waste site were removed and direct loaded for disposal at ERDF. The approximate depth of the 600-368 and 600-369 excavations is 0.5 to 1 meters (1.5 to 3.3 ft) below ground surface. All material removed from the 600-368 and 600-369 (and subsites) was direct loaded for disposal at ERDF. No soil staging pile areas or overburden areas were utilized.

Tree stumps and other farmstead debris indicated that the 600-369:4 had been located within a former farmstead orchard area.

This Site has the Following SubSites:
Code: 600-369:1
Names: 600-369:1; Segment 4 Bare Ground and Crusted Soil Area 1

Closure Info: Remediation of the 600-370 waste site was performed from May 8 through July 9, 2013. One anomaly was discovered and staged outside of the excavation area. Investigation of the anomaly with the subsequent removal and disposal of the waste site underlying soil was performed on
September 9, 2013. Approximately 4,853 bank cubic meters (6,347 bank cubic yards) of material was excavated, removed and direct loaded for disposal at the Environmental Restoration Disposal Facility (ERDF). The 600-370 waste site excavation area is approximately 7,369 square meters (79,319 sq. ft), with the approximate excavation depth of 0.3 to 1.5 meters (1 to 5 ft) below ground surface. No soil staging pile area or overburden areas were utilized.

During the 600-370 waste site excavation, an anomaly was discovered at WSP coordinates N145012.2/E577720.4. It was staged outside of the excavated area for further investigation. The anomaly consisted of a 5 centimeter (2 in.) diameter by 46 centimeter (18 in.) long steel pipe (Schedule 40) with caps on both ends and mounting brackets. The pipe appeared to be sealed with no other fittings or openings. During the anomaly investigation, the anomaly was remotely sheared and found to be empty. The anomaly was disposed at ERDF with an additional 0.3 meter (1 ft) of underlying soil from the anomaly staging location.

### Code: 600-371
#### Names: 600-371; Segment 4 Chalky Material Area
#### Type: Dumping Area
#### Status: Inactive
#### Classification: Accepted
#### Reclassification: Interim Closed Out (12/18/2013)

**Description:** This site has been remediated and Interim Closed Out. It consisted of multiple locations within a 4.6 meter (15 ft.) diameter area of a white chalky substance that resembled either grout or bentonite.

**Location:** The site was located 1.4 km (0.9 miles) east of H Avenue and 240 meters (787 feet) west of the Columbia River, at coordinates E579060.73 N150280.

**Process Description:** There is no process history associated with the 600-371 waste site.

**Closure Info:** Remediation of the 600-371 waste site occurred on July 17 and 18, 2013, and resulted in approximately 97.5 bank cubic meters (127.5 bank cubic yards) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility. Waste materials included white chalky substance from the surface of the waste site and the underlying soil. All waste site materials were direct loaded, and no soil staging pile area or overburden areas were utilized. The waste site was excavated to an approximate depth of 0.6 meters (2 ft).

### Code: 600-372
#### Names: 600-372; Segment 4 Oil Stains and Filter Areas
#### Type: Unplanned Release
#### Status: Inactive
#### Classification: Accepted
#### Reclassification: Interim Closed Out (12/18/2013)

**Description:** The 600-372 waste site and its subsites have been remediated and Interim Closed Out. It consisted of two areas that have a discarded oil filter and are devoid of vegetation. The site had been divided into two subsites, 600-372:1, Segment 4 Oil Stain and Filter Area #1a, and 600-372:2, Segment 4 Oil Stain and Filter Area #1b. The parent and subsites were reclassified together on the same form.

**Location:** The site was located northeast of the intersection of Route 2N and H Avenue.

600-372:1, E578666.74, N150323.91
600-372:2, E578082.80, N578082.80
Process Description: There is no process history associated with the 600-372 waste site.

Closure Info: Remediation of the 600-372 waste site occurred on July 18 and September 10 and 11, 2013 resulting in approximately 26 bank cubic meters (34 bank cubic yards) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). Waste materials included oil filters and the underlying stained soil. All waste site materials were direct loaded, and no soil staging pile area or overburden areas were utilized. The waste site was excavated to an approximate depth of 0.6 meters (2 ft).

This Site has the Following SubSites:

**600-372:1; Segment 4 Oil Stain and Filter Area #1a**

**Code**: 600-372:1  
**Names**: 600-372:1; Segment 4 Oil Stain and Filter Area #1a  
**Classification**: Accepted  
**Reclassification**: Interim Closed Out (12/18/2013)

**Description**: The subsite consists of a 3 sq. m. (4 sq. yd) area that has a discarded oil filter and is devoid of vegetation.

**Location**: The site is located 3 km (1.8 miles) north of Route 2N and 1 km (0.6 miles) east of H Avenue at coordinates E578666.74, N150323.91.

**Process Description**: There is no process history associated with this subsite.

**Closure Info**: Remediation of the 600-372 waste site occurred on July 18 and September 10 and 11, 2013 resulting in approximately 26 bank cubic meters (34 bank cubic yards) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). Waste materials included oil filters and the underlying stained soil. All waste site materials were direct loaded, and no soil staging pile area or overburden areas were utilized. The waste site was excavated to an approximate depth of 0.6 meters (2 ft).

**The SubSite is Part Of:**

Types: Dumping Area

Status: Inactive

Description: This site has been remediated and Interim Closed Out. It consisted of a 28 square meter (303 square feet) area devoid of vegetation and covered by a white stain and crusted soil/glass debris.

Location: The site was located 2.8 km (1.7 miles) north of Route 2 N and 0.76 km (0.47 miles) east of H Avenue, at E578471.14, N150388.87.

Process Description: There is no process history associated with the 600-373 waste site.

Closure Info: Remediation of the 600-373 waste site occurred on July 18 and September 9 and 10, 2013, and resulted in approximately 41.3 bank cubic meters (54.0 bank cubic yards [BCY]) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). The approximate depth of the 600-373 excavation is 0.3 to 0.9 meter (1 to 3 ft) below ground surface (bgs).

Remediation of the 600-374 waste site was performed on September 18, 2013, and resulted in approximately 7.5 BCM (9.8 BCY) of soil and debris being removed for disposal at ERDF. The approximate depth of the 600-374 excavation is 0.3 to 0.5 meter (1 to 1.5 ft) bgs. All material removed from the waste sites was direct loaded for disposal at ERDF and no soil staging pile areas or overburden areas were utilized.

The 600-373 waste site is within a known orchard area where historical orchard lead-arsenate applications had occurred. In accordance with the Tri-Party Agreement Change Notice TPA-CN-401 (DOE-RL 2010), dated December 6, 2010, lead and arsenic are conditionally excluded as COPCs for sites demonstrated to have been located within orchard areas.

Names: 600-375; Segment 4 Dry Cell Battery Debris Area #1

Type: Dumping Area

Status: Inactive

Description: The 600-375 waste site has been sampled and reclassified to Interim Closed Out. The five locations consisting of dry cell battery debris and stained soil, were evaluated and reclassified on the same reclassification form (form # 2013-092).

The site was originally divided into five subsites as follows:

- 600-375:1, Segment 4 Dry Cell Battery Debris Area #1a
- 600-375:2, Segment 4 Dry Cell Battery Debris Area #1b
- 600-375:3, Segment 4 Dry Cell Battery Debris Area #1c
- 600-375:4, Segment 4 Dry Cell Battery Debris Area #1d
- 600-375:5, Segment 4 Dry Cell Battery Debris Area #1e

Location: The areas were located in Segment 4 west and north of the Central Shops Area (White Bluffs Community). The center point coordinates are:

- 600-375:1, Segment 4 Dry Cell Battery Debris Area #1a, E577208.71/N150162.85
- 600-375:2, Segment 4 Dry Cell Battery Debris Area #1b, E576718.36/N148913.05
- 600-375:3, Segment 4 Dry Cell Battery Debris Area #1c, E576955.64/N147365.45

- 600-375:5, Segment 4 Dry Cell Battery Debris Area #1e, E576156.50/N148489.60
**Process Description:**
There is no process history associated with the 600-375 waste site.

**Closure Info:**
The five locations consisting of dry cell battery debris and stained soil, were evaluated and reclassified on the same reclassification form (form # 2013-092). The 600-375 waste site was recommended for remediation without confirmatory sampling based on the visual observed presence of stained soil and battery debris.

Remediation of the 600-375 waste site was performed from August 8 through October 29, 2013. Approximately 125 bank cubic meters (163 bank cubic yards) of excavated materials from the 600-375 waste site were removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. The approximate depths of the excavations range from 0.3 meters (1.0 ft) to 0.7 meters (2.3 ft) below ground surface. No waste staging pile area or overburden soil stockpiles are associated with the 600-375 waste site. With the exception of the 600-375:1 subsite, a walk around boundary survey was conducted at the 600-375 subsites following the site remediation activities. Because the size of the 600-375:1 site after remediation was small, no walk around boundary survey was conducted.

Names: 600-376; Segment 4 Stained Soil Area #2  
**Reclassification:** Interim Closed Out (1/16/2014)

**Type:** Unplanned Release

**Status:** Inactive

**Start Date:**
**End Date:**

**Description:** The waste site and the subsites have been remediated and Interim Closed Out. It consisted of two stained soil areas and two patches of bare ground with a black material covering the ground. A glass jar (probable food container) with unknown material, and dried yellow material was also present. The site had been divided into two subsites -600-376:1, Segment 4 Stained Soil Area #2a and 600-376:2, Segment 4 Stained Soil Area #2b. Both subsites were addressed on Waste Site Reclassification Form 2013-093.

**Location:** The subsites were located NNW of the intersection of Route 2N and H Avenue.

600-376:1, E575916.56, N150178.99
600-376:2, E576272.73, N149545.31

**Process Description:** There is no process history associated with the 600-376 waste site.

**Closure Info:** Waste site characterization samples were collected at the 600-376 subsites in January 2013. Based on observations during the field walkdowns to support remedial action, it was determined that the 600-376 subsites required remediation. Remediation of the two 600-376 subsites occurred between September 16 and 23, 2013. The final excavation depth for the 600-376:1 subsite was 0.6 meters (2.0 ft). The final excavation depth for the 600-376:2 subsite was 1 meter (3.3 ft). A total of approximately 101 bank cubic meters (132 bank cubic yards) of material was removed and disposed to the Environmental Restoration Disposal Facility (ERDF). Removal of stained soil from the 600-376:1 subsite and of surface debris and waste material from the 600-376:2 subsite required excavations beyond the originally mapped WIDS site boundaries.

**Start Date:**

**End Date:**

**Description:** The site was remediated and Interim Closed Out. It consisted of a 3 square meter (32 square feet) area devoid of vegetation and containing multiple oil filters, burned debris and stained soil.

**Location:** The site was located 3 kilometers (1.9 miles) south of Route 1 and 97 meters (318 ft) east of Route 4 North. The area was located between Route 4N and the west end of Gable Mountain.
Process Description: There is no process history associated with the 600-377 waste site.

Closure Info: Remediation of the 600-377 waste site was performed on December 16, 2013. No anomalies were discovered during excavation. A total of approximately 2.64 bank cubic meters (3.45 bank cubic yards) of material was removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. No overburden soil was stockpiled to be used as backfill. The 600-377 waste site excavation area is approximately 8 square meters (86 sq ft), with the approximate depth of 0.30 meter (1 ft) below ground surface. All excavated materials were direct loaded, and no soil staging pile area or overburden areas were utilized.

</tr>
<tr>
<td>Type:</td>
<td>Storage Tank</td>
</tr>
<tr>
<td>Status:</td>
<td>Inactive</td>
</tr>
</tbody>
</table>

Description: The waste site has been remediated and Interim Closed Out. It was a 379 liter (100 gal) underground storage tank used to store fuel for the 506 Telephone Exchange emergency generator building (also known as the 508 bldg).

Location: The 506, 507 and 508 buildings were located on the south side of Route 11A. A ground penetrating radar scan found a feature resembling a fuel tank at coordinates E581237.93 N138768.82. The fuel tank was located on the west side of the 508 building.

Process Description: The 506 B-Y Telephone Exchange was constructed in 1945. It handled the call switching between the inner and outer areas. It also housed the 50 line Hanford exchange and served as the primary base of operations for telephone maintenance personnel in support of the 100 and 200 Areas (GEH-26434-400). The 508 Building provided emergency power to support the 506 B-Y Telephone Exchange Building in the event of a power outage. The adjacent 507 building was used for storage, minor equipment repair and maintenance tasks.

Closure Info: Remediation of the 600-378 waste site began on December 18, 2013. The 379 liter (100 gal) underground fuel tank was discovered 0.46 meters (1.5 ft) below ground surface. The tank was completely empty and positioned sideways as shown on drawing H-5-548. Remediation continued on January 8, 2014, to remove and dispose the underground fuel tank and underlying soil. While removing the fuel tank, it was noted that the valve attached to the tank was broken off. After removing the tank from the excavation and loading it for disposal a dark black stain was observed below the tank. It was determined that the black staining under the fuel tank was the result of the dust-suppression water applied to the inside of the tank. Two pipeline segments that connected to the fuel tank were also removed for disposal.

A 0.6 meter (2 ft) long, 2 inch diameter galvanized steel (Schedule 40) pipeline was observed buried beside the fuel tank. It was a fill pipe that connected to the top of the fuel tank. A copper 3/8 inch diameter pipeline that trended east and connected to the generator structure was also found within the excavation. Concrete debris was uncovered on the east side of the excavation, consistent with the location of the 508 Emergency Generator Building. Some burned debris including burned wood debris was found at 0.9 meters (3 ft) below ground surface, on the northwest side of the excavation. The burned material was only partially removed because it is not associated with the 600-378 fuel tank.

Verification sampling performed on February 25, 2014, indicated that benzo(a)pyrene was
above the direct exposure cleanup criteria at sample location FS-3. Additional remediation was performed on April 30, 2014, to remove contaminated material from the excavation. The entire 600-378 excavation was re-excavated. Remediation of the 600-378 waste site resulted in a total excavation of approximately 43.5 BCM (56.8 BCY) of contaminated soil and debris that was direct loaded for disposal at ERDF. No overburden soil was stockpiled to be used as backfill.

---

**Code:** 600-379  
**Classification:** Accepted  
**Reclassification:** Interim Closed Out (5/7/2014)  
**Names:** 600-379; Segment 4 Burn Area #1  
**Type:** Dumping Area  
**Status:** Inactive

**Description:** The site was remediated and Interim Closed Out. It consisted of a burn area with visible remnants.

**Location:** The site was located 1.2 Kilometers (0.75 miles) north of Route 11 and 5.7 Kilometers (3.5 miles) west of Route 2 North. It was also located 648 meters (2,126 ft) southwest of the 213-J & K Storage Facility.

**Process Description:** There is no process history associated with the 600-379 waste site.

**Closure Info:** The 600-379 waste site was recommended for remediation without confirmatory sampling due to possible contamination based upon extensive debris and evidence of burning. Remediation of the 600-379 waste site was performed from December 18, 2013, through January 8, 2014. No anomalies were encountered during the remediation. The excavation in the remediated area was approximately 70 square meters (768 sq. ft.) and 0.6 meters (2 ft) below ground surface. A total of approximately 43 bank cubic meters (56 bank cubic yards) of material was removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. No waste staging pile area or overburden soil stockpiles are associated with the 600-379 waste site. A walk around boundary survey was conducted at the 600-379 waste site following site remediation.

---

**Code:** 600-380  
**Classification:** Accepted  
**Reclassification:** Interim Closed Out (2/25/2014)  
**Names:** 600-380; Segment 4 Unknown Cylinder  
**Type:** Dumping Area  
**Status:** Inactive

**Description:** The waste site has been remediated and Interim Closed Out. It consisted of a cylinder with unknown contents, located 20 meters (64 ft) from a maintained gravel road.

**Location:** This site is located approximately 0.96 km (0.60 miles) west of the intersection of H Avenue and the 100-H perimeter road at coordinates E576701.265 N151747.148.

**Process Description:** There is no process history associated with the 600-380 waste site.

**Closure Info:** On October 7, 2013, field investigation of the cylinder was conducted. Significant corrosion of the cylinder’s exterior indicated that the cylinder had been abandoned for many years. Markings on the cylinder indicated that it formerly contained hydrogen sulfide gas and the cylinder manufacture date was July 1924. The latest legible hydrostatic test date marked on the cylinder was August 1945, but partial markings of a test date in 1950 were also present. Further field
investigation on October 10, 2013, determined that the cylinder valve was open and the cylinder was empty. The cylinder was removed for disposal at the ERDF on October 24, 2013.

The 600-380 cylinder was a surface feature that did not require subsurface remedial action. Assuming hydrostatic testing occurred in 1950, the cylinder would have been out of service by 1955 as the testing is required every five years. The only contaminant of potential concern for the site would be sulfate. However, given the cylinder would have been out of service by 1955 and was found open and empty during field investigation, it is highly unlikely than any sulfate contamination would be present on the surface soil. Therefore, it is proposed the 600-380 waste site be reclassified to Interim Closed Out without verification sampling based on removal and disposal of the cylinder.

Process Description: There is no process history associated with the 600-382 waste site.

Closure Info: Remediation of the 600-382 waste site (and all subsites) was performed from October 29, 2013, through March 10, 2014. No anomalies were encountered during the remediation. Approximately 85 bank cubic meters (111 bank cubic yards) of excavated materials from the 600-382 waste site were removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. The approximate depths of the excavations ranged from 0.3 meters (1.0 ft) to 1.0 meters (3.3 ft) below ground surface. No waste staging pile area or overburden soil stockpiles are associated with the 600-382 waste site. Walk around boundary surveys were conducted at each of the 600-382 subsites following their remediation.

Classification: Accepted

Reclassification: Interim Closed Out (7/8/2014)

Start Date: Interim Closed Out (7/8/2014)

End Date: Interim Closed Out (7/8/2014)

Description: The 600-383 waste site, including all of the subsites, was remediated and Interim Closed Out. All subsites were addressed in the same Remaining Sites Verification Package and Waste Site Reclassification Form (2014-023). The waste site consisted of ten locations that contained remnants of batteries.

The site was divided into ten subsites as follows:

- 600-383:1, Segment 4 Battery Remnant Area #2a; Consisted of a 4 meter (13 ft) diameter area of discarded dry cell battery remnants on bare ground.
- 600-383:2, Segment 4 Battery Remnant Area #2b; Consisted of multiple dry cell batteries in an approximate 3 meter (10 ft) diameter area of bare ground.
- 600-383:3, Segment 4 Battery Remnant Area #2c; Consisted of multiple dry cell batteries in an approximate 1 meter (3 ft) diameter area of bare ground.
- 600-383:4, Segment 4 Battery Remnant Area #2d; Consisted of a dry cell battery pack in an approximate 1 meter (3 ft) diameter area of bare ground.
- 600-383:5, Segment 4 Battery Remnant Area #2e; Consisted of two areas approximately 1 meter (3 ft) diameter each of discarded dry cell batteries. The areas are devoid of vegetation.
- 600-383:6, Segment 4 Battery Remnant Area #2f; Consisted of a 1 meter (3 ft) diameter area of multiple discarded dry cell batteries on bare ground.
- 600-383:7, Segment 4 Battery Remnant Area #2g; Consisted of wet cell car battery remnants located approximately 1 meter (3 ft) from a dirt road.
- 600-383:8, Segment 4 Battery Remnant Area #2h; Consisted of six dry cell battery remnants in an approximate 6 meter (20 ft) diameter area. No staining was visible.
- 600-383:9, Segment 4 Battery Remnant Area #2i; Consisted of six dry cell battery remnants in an approximate 6 meter (20 ft) diameter area. No staining was visible.
- 600-383:10, Segment 4 Battery Remnant Area #2j; Consisted of a 2 meter (7 ft) diameter area of debris from multiple dry cell batteries on bare ground.

**Location:**
The subsites were located between the 100-D Area and the railroad tracks that lead to the 100-H Area.

600-382:1, E576315.892, N150679.753  
600-382:2, E576286.206, N150613.712

600-382:4, E576231.571, N151788.478  
600-382:5, E574850.417, N150781.277

**Process Description:**
There is no process history associated with the 600-383 waste site.

**Closure Info:**
All subsites were addressed in the same Remaining Sites Verification Package and Waste Site Reclassification Form (2014-023).

The 600-383 waste site was recommended for remediation without confirmatory sampling based on the observed presence of battery debris. Waste characterization samples were collected from each of the 600-383 subsites prior to the start of remediation. Remediation of the 600-383 waste site was performed from September 25 through November 13, 2013. Approximately 55 bank cubic meters (72 bank cubic yards) of excavated materials from the 600-383 waste site were removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. The approximate depths of the excavations range from less than 0.3 to 0.46 meters (1.0 to 1.5 ft) below ground surface.

Location: The site is located 1.1 km (0.7 miles) south of the Columbia River and 1.6 km (1.0 miles) west of the H-Area perimeter road at coordinates E575624.336 N153303.821.
Process Description: There is no process history associated with this subsite.
Closure Info: All subsites were addressed in the same Remaining Sites Verification Package and Waste Site Reclassification Form (2014-023).

The 600-383 waste site was recommended for remediation without confirmatory sampling based on the observed presence of battery debris. Waste characterization samples were collected from each of the 600-383 subsites prior to the start of remediation. Remediation of the 600-383 waste site was performed from September 25 through November 13, 2013. Approximately 55 bank cubic meters (72 bank cubic yards) of excavated materials from the 600-383 waste site were removed and direct loaded for disposal at the Environmental Restoration Disposal Facility. The approximate depths of the excavations range from less than 0.3 to 0.46 meters (1.0 to 1.5 ft) below ground surface.

The SubSite is Part Of:
Code: 600-383
Names: 600-383; Segment 4 Battery Remnant Areas #2

---

Code: 600-383:10
Names: 600-383:10; Segment 4 Battery Remnant Area #2
Reclassification: Interim Closed Out (7/8/2014)
Type: Dumping Area
Status: Inactive
Description: This subsite consists of a 2 meters (7 feet) diameter area of discarded batteries.
Location: The site is located 1.5 km (0.9 miles) south of the Columbia River 2.0 km (1.2 miles) west of H Avenue at coordinates E575222.383 N152913.096.

Process Description: There is no process history associated with this subsite.

Closure Info: All subsites were addressed in the same Remaining Sites Verification Package and Waste Site Reclassification Form (2014-023).

The waste site was recommended for remediation without confirmatory sampling based on the observed presence of battery debris. The SubSite is Part Of:
Code: 600-383
Names: 600-383; Segment 4 Battery Remnant Areas #2

Code: 600-384
Names: 600-384; Segment 4 Stained Soil Area #3
Type: Unplanned Release
Status: Inactive
Description: The waste site was a grouping of five stained soil areas of either yellow powder, tar, or crusted soils. The site had been divided into five subsites. All five subsites have been remediated and Interim Closed Out on the same reclassification form (2014-008). The parent site is also considered Interim Closed Out.

Process Description: There is no process history associated with the 600-384 waste site.
Closure Info: Remediation of the 600-384:1, 600-384:2 and 600-384:5 subsites was performed on November 4 and 5, 2013. Remediation of the 600-384:3 and 600-384:4 subsites was performed on November 25, 2013. Remediation of the total 600-384 waste site resulted in approximately 92 bank cubic meters (BCM) (120 bank cubic yards [BCY]) of soil and debris being removed for disposal at the Environmental Restoration Disposal Facility (ERDF). Additional remediation was performed at the 600-384:3, 600-384:4, and 600-384:5 subsite locations on March 3 through 5, 2014. Additional soil was removed across the entire base of each subsite excavation. Further remediation performed at these three subsites resulted in an additional soil removal of 233 BCM (305 BCY). The final remediation resulted in a total of approximately 325 BCM (425 BCY) of contaminated material being removed and disposed at ERDF. All material removed from the waste sites was direct loaded for disposal at ERDF, and no soil staging pile areas or overburden areas were utilized.

The dimensions of the remediation areas are:

600-384:1 = 7 by 7 meters, 1.5 meters deep
600-384:2 = 16 by 9 meters, 1.2 meters deep
600-384:3 = 14 by 8 meters, 1 meter deep
600-384:4 = 14 by 13 meters, 1.3 meters deep
600-384:5 = 10 by 7 meters, 0.9 meter deep

The waste site has been remediated and Interim Closed Out. It consisted of wet cell battery remnants partially buried and some potential related staining visible.

Location: The site was located approximately 835 meters NNW of the 310 building (TEDF) and 13 meters west of Route 4S. The coordinates for the battery site are E593533.2002, N118226.1146, northwest of the 310 (TEDF) building.

Closure Info: Remedial action at the 600-386 waste site was conducted on May 30, 2012. Approximately 0.5 bank cubic meters (0.6 bank cubic yards) of soil and debris (battery remnant) was removed and disposed at the Environmental Restoration Disposal Facility. The removal of the battery and soil resulted in a hole approximately 0.7 meters (2.3 ft) deep. There are no overburden soil stockpiles or waste staging pile areas associated with this waste site. No anomalies were
encountered during remediation activities.

**Description:** The waste site is an area of debris that includes degrading battery components and unbroken glass jars containing an unknown substance.

**Location:** The waste site is located south of Rt. 11A, near the northern boundary of the OCSA waste site at coordinates E570316.8 N138606.62.

</table>
Inactive Status: 1/1/1995 End Date:

Description: This site has been remediated based on the 100 Area Record of Decision. Prior to remediation, the Tar Flow site contained soft, tar-like material on the surface. The material appeared to have flowed approximately 45.75 meters (150 feet) to the northeast into a drainage ditch. The Stained Sand Area was located on the east slope of a sand dune. The area had vegetation and the sand appeared to be stained. After remediation, both sites were regraded to a smooth, uniform surface.

Location: The Tar Flow and Stained Sand sites were located northwest of the 1171 building. The Tar Flow area was located 320 meters (1,050 feet) north of the northwest corner of the 1171 building. The Stained Sand site was located approximately 271 meters (888 feet) north of the northwest corner of the 1171 building.

Waste Type: Construction Debris

Waste Description: The waste consisted of petroleum contaminated soil.

Closure Info: The contaminated soil was removed by the US Army Corp of Engineers on June 26, 1995. 1,600 cubic yards of contaminated soil was excavated and stockpiled. Confirmatory samples indicated the remediation had met the clean-up levels established in the Record of Decision. The contaminates soil was disposed of at the Columbia Ridge Disposal Facility in September 1995.

(The remediation occurred prior to the development of the TPA-MP-14 process)

Code: UPR-200-E-18 Classification: Accepted
Names: UPR-200-E-18; Contamination Release at the 216-A-8 Sampler Pit; UN-200-E-18 Reclassification: None
Type: Unplanned Release Start Date: 1/1/1959
Status: Inactive End Date:

Description: The sampler pit is a concrete structure with three valves, two vent stacks and one curved bonnet extending from the structure. The structure is surrounded with post and chain with Underground Radioactive Material and Contamination Area signs. The area around the structure is gravel and asphalt.

Location: The release site is approximately 30 meters (100 feet) east of the 241-A-271 Building, at the 216-A-8 proportional sample pit. It is east of 241-A Tank Farm and west of Canton Ave.

Release Description: Contaminated moisture dripping from a vent pipe bonnet at the 216-A-8 Proportional Sample Pit contaminated the ground around the cement pad.

Waste Type: Steam Condensate

Waste Description: Low-level fission products dripped onto the ground from the vent pipe bonnet.
B to 207-B Line Break; UN-200-E-79; UN-216-E-7

Type:  Unplanned Release
Status:  Inactive
Description:  The area where the release occurred is delineated by light duty posts and chain measuring approximately 7.6 meters (25 feet) wide and 61 meters (200 feet) long. It is posted with Underground Radioactive Material signs.
Location:  The site is located between the 242-B Evaporator and the 207-B Retention Basin, south of 241-B Tank Farm.
Release Description:  In June 1953, five leaks were discovered in the waste line that runs from 242-B to 207-B.
Related Sites/Structures:  The site is associated with the 242-B Evaporator and the 207-B basin. The release occurred in the pipeline assigned sitecode 200-E-264-PL.
Process Description:  The release consisted of a 10 centimeter (4 inch) diameter, cast iron underground pipeline that was found to be leaking in 1953.
Waste Type:  Misc. Trash and Debris
Waste Description:  The release consisted of approximately of 10 curies Mixed Fission Products (MFP) from the pipeline.

Code:  UPR-200-E-99
Type:  Unplanned Release
Status:  Inactive
Description:  The previously posted Surface Contamination Area was released from radiation zone status in March 1981. A WIDS single sign had been placed at the approximate center location of the release. This sign was removed in 2010 when support trailers were placed in the area. Other areas with radiological postings are currently visible in this area.
Location:  The release was a posted Surface Contamination Area located south of 7th Street, directly south of the 244-CR Vault.
Release Description:  The ground surface surrounding the 244-CR Vault became contaminated during the numerous piping changes and activities associated with the vault.
Related Sites/Structures:  UPR-200-E-99 is associated with the 244-CR Vault and the 241-C Tank Farm.
Process Description:  The area south of 7th Street and west of Buffalo Ave. has had numerous areas of radiological postings over the years due to contamination migration from the 241-C Tank Farm and the 244-A Lift Station.
Waste Type:  Chemicals
Waste Description:  The release was associated with the migration of contaminated particulates from the 244-CR Vault onto the surrounding ground surface. The 244-CR Vault was used in the transfer of process waste between facilities.
Unplanned Release

**Names:**
- UPR-200-E-100; Radioactive Contamination Near 244-A Lift Station; UN-200-E-100; UN-216-E-100; UN-216-E-29

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Release Description:** Various radiological postings exist in this vicinity that are associated with the 244-A Lift Station and 241-C Tank Farm contamination migration. A WIDS sign has been placed at the approximate location of the release. Routine radiological surveys of the 244-A Lift Station Area have changed the size and the shape of the posted areas as new contamination specks are identified and remediation attempts occur.

**Location:** UPR-200-E-100 consisted of radioactive rodent feces and contamination specks located south Seventh Street and west of Buffalo Street, adjacent to the 244-A Lift Station. Due to rodent movement and some contamination migration from wind, the size and the shape of the contaminated area was redefined several times.

**Release Description:** The release area was determined to be due to windblown particulates and biological transport (rodent feces) from the tank farms and the 244-A Lift Station. Another source of the contamination may be an underground pipeline leak near the 244-A lift station. A waste site number (UN-216-E-29) was assigned to this area on August 18, 1985.

**Related Sites/Structures:** UPR-200-E-100 is associated with the 244-A Lift Station, the 241-C Tank Farm, UPR-200-E-143, UPR-200-E-56 and the 216-A-40 Retention Basin.

**Waste Type:** Water

**Waste Description:** The contamination was due to windblown particulates and biological transport (rodent feces) from the 200 East Area tank farms and the 244-A Lift Station.

---

**Code:** UPR-200-W-20

**Names:** UPR-200-W-20; Spread of Contamination from a Diversion Box; UN-200-W-20

**Type:** Unplanned Release

**Status:** Inactive

**Classification:** Accepted

**Reclassification:** None

**Release Description:** In January and February 1953 work being done inside a diversion box resulted in extensive spread of contamination to the ground. An area of about 93 square meters (1000 square feet) around the diversion box was covered with six inches of clean gravel. This area was roped off and posted with radiation zone signs in 1953.

**Location:** Due to discrepancies in reference documentation, it is not possible to be certain where this release occurred.

**Related Sites/Structures:** May be a Duplicate entry - see UPR-200-W-82.

**Process Description:** The 241-S-151 Diversion Box was used to redirect waste solutions from processing and decontamination operations. Waste quantities were variable depending on the specific plant operations. Leak detection and air monitoring are performed continuously with the 241-S Tank Farm. The unit interconnects the 240-S-151, 241-SX-151, and the 241-S Tank Farm.

**Waste Type:** Storage Tank

<tr>
<td>Description:</td>
<td>In 2008, the area surrounding 241-TX-152 Diversion Box, 241-TX-155 Diversion Box and 241-TX-302B catch tank has been covered with a layer of clean gravel. It is posted with Bio-Barrier and Underground Radioactive Material signs. A single white sign with black letters reading &quot;WIDS UPR-200-W-76&quot; is hanging on the chain on the near the south side of the 241-TX-152 Diversion Box.</td>
</tr>
<tr>
<td>Location:</td>
<td>The site is located east of Camden Ave. The radiologically posted area surrounds the 241-TX-152 Diversion Box, 241-TX-155 Diversion Box and 241-TX-302B catch tank.</td>
</tr>
<tr>
<td>Release Description:</td>
<td>On August 24, 1977, contaminated rabbit fecal pellets were found around the 241-TX-155 Diversion Box. A more extensive survey revealed contaminated pellets with readings as high as 100 millirads/hour scattered in an area of about 50 yards (45.72 meters) by 100 yards (91.44 meters) around the diversion box. Two pellets were analyzed for radiological contaminants and found to contain mostly cesium-137. Subsequent surveys found additional spotty contamination extending in a 152 meter (500 foot) radius around the 241-TX-155 diversion box. The source of the contamination was traced to leaks from the 241-TX-155 Diversion Box. The east side of the diversion box had been partially excavated in 1976. The excavation was left open for more than a year, allowing access for animal intrusion.</td>
</tr>
<tr>
<td>Related Sites/Structures:</td>
<td>The site is associated with the 241-TX-155 and 241-TX-152 Diversion Boxes.</td>
</tr>
<tr>
<td>Process Description:</td>
<td>The original Occurrence Report (77-180) described the release as contaminated rabbit feces extending 100 yards (91.44 meters) by 50 yards (45.72 meters) around the 241-TX-155 Diversion Box and additional specks of contamination extending to a 152 meter (500 foot) radius around the 241-TX-155 diversion box.</td>
</tr>
<tr>
<td>Waste Type:</td>
<td>Process Effluent</td>
</tr>
<tr>
<td>Waste Description:</td>
<td>Radioisotopic analyses on two individual rabbit pellets revealed: 18.6 microCuries cesium-137 per gram of sample, 0.044 microCuries cesium-134 per gram of sample, 0.093 microCuries europium-155 per gram of sample, 0.026 microCuries europium-154 per gram of sample, and 2.63 microCuries strontium-90 per gram of sample. Beta-gamma readings up to 100 millirads/hour were found.</td>

| Names:            | UPR-200-W-82; Contamination Spread at 240-S-151; UN-200-W-82                                   |
| Type:             | Unplanned Release                                                                             |
| Status:           | Inactive                                                                                       |
| Description:      | A WIDS sign has been placed on the chain link fence north of 202-S. The fenced area is also marked with Underground Radioactive Material Area signs. The 240-S-151 Diversion Box is posted with radiological warning signs. The contamination spread occurred in the soil adjacent |
to the diversion box.

**Location:** The contamination spread occurred on the north and east side of the 240-S-151 Diversion Box and the 240-S-302 Catch Tank, on the north side of the REDOX facility (202-S).

**Release Description:** A piece of equipment moved in for the 240-S-151 Diversion Box installation, was caught under the late snow cover. Moisture from the melting snow and rain penetrated the plastic wrap, and ran off toward the catch tank area spreading contamination over the areas of run-off. Traffic from daily routine surveillance of the catch tank liquid levels apparently tracked some contamination to the chain boundary and step-off area.

**Related Sites/Structures:** UPR-200-W-82 was associated with the 240-S-151 Diversion Box and the 240-S-302 Catch Tank. May be a Duplicate entry - see UPR-200-W-20.

**Waste Type:** Stormwater Runoff

**Waste Description:** The release consisted of beta/gamma particulates that spread from a contaminated piece of equipment, with readings up to 80,000 counts per minute found outside the radiation zone.
